This confusion is compounded by the complete lack of a defined project area in the Draft EIS/EIR. As we noted previously, the Draft EIS/EIR lacks a "precise location and boundaries" map and lacks a "general description of the project's technical characteristics." (Cal. Admin. Code, tit. 14, § 15124.) Chapter 2, Alternatives Considered, attempts this with a series of figures, but the complete lack of a single project and focus on the development of alternatives results in failure. For example, Figure 2-1 contains a map that combines three apparent alternative alignments. Figure 2-3 portrays the TSM Alternative,[1] Figure 2-8 the At-Grade Emphasis LRT Alternative, Figure 2-9 the Underground Emphasis LRT Alternative, Figure 2-10 the Fully Underground LRT Alternative, with variations of these at Figures 2-12, and 2-13. The technical appendices to the Draft EIS/EIR, which are not included in the RDEIR, make no

6

[1] The TSM is merely a Transportation Systems Management Alternative, which proposes only the construction of bus stops. (Draft EIS/EIR, App. FF, at 15.)

attempt to state a preferred project, much less describe the June 2011 Proposal. (Draft EIS/EIR Technical Appendix II, foldout: "Regional Connector Transit Corridor Draft Conceptual Plans and Profiles: December 18, 2009.")

6 cont'd

Thus, there is not a single route described as the project from which alternatives may be judged. CEQA requires that an EIR identify feasible alternatives that could avoid or substantially lessen the project's significant environmental impacts. (Pub. Res. Code, §§ 21002, 21002.1, subd. (a), 21100, subd. (b)(4).) The Draft EIS/EIR here impermissibly skips the project definition although Metro, as "the lead agency plays a pivotal role in defining the scope of environmental review, lending its expertise in areas within its particular domain, and in ultimately recommending the most environmentally sound alternative." (*Kings County Farm Bureau v. City of Hanford* (1990) 221 Cal.App.3d 692.) Rather than define a proposed project, from which many key CEQA and NEPA obligations then build upon, the agency has delayed this to a later point in time. (*See* Draft EIS/EIR, at 2-1 ["Depending on which alternative is selected…"].) By defining a range of alternatives only, and not a precise project, Metro has also violated CEQA's and NEPA's respective goals of an informed public. (Pub. Res. Code, § 21003(b) [EIRs should be organized and written in a manner that will make them "meaningful and useful to decision-makers and to the public."]; *Berkeley Keep Jets Over the Bay Committee v. Bd. of Port Commissioners* (2001) 91 Cal.App.4th 1344, 1355 ["A prejudicial abuse of discretion occurs if the failure to include relevant information precludes informed decision making and informed public participation."]; (40 C.F.R. §§1502.4, subd. (a), 1502.10 [an EIS must "properly define[]" the proposed project and provide a "clear presentation of the alternatives including the proposed action."]; *id.* § 1502.8. [an EIS . . . must . . . "be written [. . .] so that decisionmakers and the public can readily understand [it]."].)

7

Metro does not satisfy CEQA's requirement for "precise location and boundaries" of a project by providing location and boundaries for three to five alternatives. One cannot measure an alternative's strengths and weaknesses without a project description or a defined project. "[A]n accurate stable and finite project description is the sine qua non of an informative and legally sufficient EIR." (*San Joaquin Raptor Rescue Center v. County of Merced* (2007) 149 Cal.App.4th 645, 655 ("*San Joaquin Raptor II*") (quoting *County of Inyo v. City of Los Angeles* (1977) 71 Cal.App.3d 185, 193.) Furthermore "[a]n accurate project description is necessary for an intelligent evaluation of the potential environmental effects of a proposed activity." (*Silveira v. Las Gallinas Valley Sanitary District* (1997) 54 Cal.App.4th 980, 990 (citation omitted).) Under NEPA, the "EIS process should serve both to alert the public of what the agency intends to do and give the public enough information to be able to participate intelligently in the EIS process." (*California v. Block* (9th Cir. 1982) 690 F.2d 753, 772.) Thus, an EIS must "properly define[]" (40 C.F.R. §1502.4(a)) the proposed project and provide a "clear presentation of the alternatives including the proposed action." (*Id.*, § 1502.10.)

8

The RDEIR resembles the problems presented in *County of Inyo v. City of Los Angeles*. The project there was defined merely as an increase in water pumping rates from subsurface water in Owens Valley. The EIR, however, discussed far broader concepts, such as canal work, a conservation program, reduction of stockwater and reservoir operations. (71 Cal.App.3d, at 190.)

9

> A curtailed or distorted project description may stultify the objectives of the reporting process. Only through an accurate view of the project may affected outsiders and public decision-makers balance the proposal's benefit against its environmental cost, consider mitigation measures, assess the advantage of terminating the proposal (i.e., the 'no project' alternative) and weigh other alternatives in the balance. An accurate, stable and finite project description is the sine qua non of an informative and legally sufficient EIR.

(*Id*., at 192-93.) In *County of Inyo*, the "incessant shifts among different project descriptions do vitiate the City's EIR process as a vehicle for intelligent public participation." (*Id*., at 197.) "The defined project and not some different project must be the EIR's bona fide subject." (*Id.*, at 199.) "Because the Final EIR['s . . .] list of alternatives is not tied to a reasonably conceived or consistently viewed project, the Los Angeles EIR does not comply with CEQA's demand for meaningful alternatives." (*Id*., at 203.) Here, too, the document's failure to define a project has utterly frustrated the public's ability to participate in the environmental review process.

9 cont'd

There Is No Environmentally Superior Alternative Identified

The RDEIR again fails to identify an environmentally superior alternative – one of CEQA's most basic requirements. CEQA requires an EIR to identify and discuss feasible alternatives to a proposed project. (Pub. Res. Code, §§ 21002, 21002.1(a), 21061, 21100(b)(4).) Of the alternatives considered, the CEQA Guidelines require that an EIR identify the "environmentally superior alternative," which assists decision makers in considering a project approval. (See Cal. Admin. Code, tit. 14, §§ 15126.6(a), (e)(2).)

10

As before, for those sections of the Draft EIS/EIR that have been recirculated, the RDEIR only describes the alternatives considered, but it does not identify an environmentally superior alternative that would minimize the Regional Connector's significant environmental effects. (*See* RDEIR at 2-1 to 2-50.) In one instance (Displacement and Relocation), there is a table that allows the reader to compare the impacts across the five alternatives. (RDEIR at 4.2-5.) However, this type of comparison is never repeated, and the reader is left to sort through hundreds of pages to figure out which alternative has fewer impacts in any given impact area. Under CEQA, a proper analysis of alternatives is essential to comply with CEQA's mandate that significant environmental damage be avoided or substantially lessened where feasible. (Pub. Res. Code, § 21002; Cal. Admin. Code, tit. 14, §§ 15002(a)(3), 15021(a)(2).)

11

Ultimately, the RDEIR concludes that "[b]ased on the results of the technical analysis Draft EIR Sections, the LPA, as refined, is the environmentally superior alternative." (RDEIR at 2.6.3) However, this is simply a naked conclusion; there is no discussion as to how this conclusion was reached. The RDEIR's and Draft EIS/EIR's failure to disclose an environmentally superior alternative is prejudicial and violates CEQA.

The Project Continues To Be Piecemealed

No effort has been made in the RDEIR to analyze the full impact of the Project despite its own identification of the need to relocate numerous buildings and structures and future development opportunities on property that Metro is acquiring for construction purposes. The RDEIR fails to identify or analyze these potential impacts. (*See* RDEIR at 4.2-26 ["Upon completion of construction, property needed for construction but not required to maintain the physical infrastructure, or necessary for access would be included in Metro Joint Development Program for possible development. Any development shall be environmentally and separately cleared from this project and shall undergo its own community input process."], 4.2-17 to 4.2-25. [discussing partial and full takes, which would require relocation of existing businesses].) This is improper under both NEPA and CEQA, and it is not enough that these projects, which will only occur because of the Regional Connector, will undergo separate environmental review. 12

Under NEPA, connected actions must be considered together in the same EIS. (40 C.F.R. § 1508.25; *Thomas v. Peterson* (9th Cir. 1985) 753 F.2d 754, 758-9.) Connected actions are those that (1) "[a]utomatically trigger" other actions potentially requiring EISs; (2) "cannot or will not proceed unless other actions are taken previously or simultaneously;" or (3) are "interdependent parts of a larger action and depend on the larger action for their justification." (40 C.F.R. §1508.25.) Courts apply an "independent utility" test under NEPA to "determine whether multiple actions are so connected as to mandate consideration in a single EIS." (*Great Basin Mine Watch v. Hankins* (9th Cir. 2006) 456 F.3d 955, 969.) Similarly, under CEQA a public agency "may not divide a single project into smaller individual projects to avoid its responsibility to consider the environmental impacts of the project as a whole." (*Sierra Club v. West Side Irrigation Dist.* (2005) 128 Cal.App.4th 690, 698.) An accurate EIR must ensure that "environmental considerations do not become submerged by chopping a large project into many little ones – each with a minimal potential impact on the environment – which cumulatively may have disastrous consequences." (*Bozung v. Local Agency Formation Comm'n of Ventura County* (1975) 13 Cal.3d 263, 283-84.) Accordingly, "an EIR must include an analysis of the environmental effects of future expansion or other action if: (1) *it is a reasonably foreseeable consequence of the initial project*; and (2) the future expansion or action will be significant in that it will likely change the scope or nature of the initial project or its environmental effects." (*Laurel Heights Improvement Assn. v. Regents of University of California* (1988) 47 Cal.3d 376, 396.) 13

The redevelopment of property not required to operate the Regional Connector is a connected action under NEPA and a "reasonably foreseeable consequence of" the Project under CEQA. But for Metro's acquisition of these sites for the Regional Connector, there would be no property to contribute to the "Metro Joint Development Program for possible development." (Draft EIS/EIR, at 4-28.) Similarly, because Metro recognizes now that certain property it is acquiring for the Regional Connector will not be necessary for its operation and it intends to contribute it to its development program, it is reasonably foreseeable that these properties will be developed by Metro. Impacts from this development should have been included in the Draft EIS/EIR and, now, in the RDEIR. 14

The RDEIS Does Not Accurately Analyze Impacts To Or Around Japanese Village Plaza

Noise and Vibration Impacts Are Improperly Addressed. Construction is estimated to last for up to four years at the 1st/Central Avenue Station. (RDEIR at 4.7-31 [Table 4.7-15].) Yet, the RDEIR concludes that construction noise and vibration impacts would be less than significant at Japanese Village Plaza as a result of compliance with local ordinances and implementation of vague BMP, such as portable noise sheds, or temporary noise barriers. (RDEIR at 4.7-40.) 15

However, this conclusion appears to be based on incorrect assumptions regarding the proximity of construction to Japanese Village Plaza generally, and its parking garage specifically. The report prepared by Wilson, Ihrig & Associates assumes that "none of the buildings [at Japanese Village Plaza] fall within the applicable screening distances for cut and cover construction, and thus there would be no vibration impacts from cut and cover construction." (March 15, 2011, Memo. at 4.) Figure 2-18, however, shows cut and cover construction occurring within only a feet at most of the Japanese Village Plaza property line and its multi-story garage. Even a cursory review shows that this is far closer than the more than 15 feet assumed in the Wilson, Ihrig & Associates' March 15, 2011, Memorandum. Independent expert analysis shows that the projected levels of vibration expected at Japanese Village Plaza's garage "approaches and/or exceeds the potentially damaging threshold specified in Table 4.7-4." (*See* Attachment B at 4.) Vibration impacts will surely be much greater at the very short distance shown in the RDEIR. This analysis, therefore, must be redone, and the actual significance of impacts determined. 16

The Wilson, Ihrig & Associates March 15, 2011, Memorandum also predicts that the tunnel boring machine activities would "exceed the annoyance criteria" for vibrations. (March 15, 2011, Memo. at 5.) This is a far more liberal determination than that of an independent expert, who finds that the vibration will exceed annoyance, and exceeds the potentially damaging threshold. (*See* Attachment B at 4.) Yet the mitigation measures proposed in the Wilson, Ihrig & Associates March 15, 2011, Memorandum do not relate to damage to buildings; they are intended only to mollify an impacted occupant. (March 15, 2011, Memo. at 5.) Given the significant risks posed to building integrity, these mitigation measures are not sufficient to reduce this potential impact to below significant levels. (*See* Attachment B at 4-5.) 17

The RDEIR Does Not Address New Significant Impacts To Geotechnical Hazards, Subsidence, Or Traffic. The RDEIR concedes that there could be new impacts as a result of the realignment changes, but does not analyze the potential for new impacts to geotechnical hazards, subsidence, or traffic. The purpose of recirculation is to give the public and public agencies an opportunity to evaluate the Project's new alignment and new potential impacts, and the validity of the conclusions that Metro has drawn. *Save Our Peninsula Comm. v. Monterey County Bd. of Supervisors* (2001) 87 Cal.App.4th 99, 121. The RDEIR's failure to evaluate, let alone identify, the potential for new impacts as a result of the alignment changes is clear error. 18

For example, Section 4.9 of the Draft EIS/EIR states:

> [T]he project area would be susceptible to the potential spread of

> contaminated groundwater and release of subsurface oilfield gases. Also, the Fully Underground LRT Alternative would require more property acquisition and demolition of existing structures, which could heighten the risk of potential release of asbestos fibers and lead-based paint particles.

(Draft EIS/EIR, § 4.9.3.5.2 [Hazardous Materials].) The RDEIR does not address this impact even though the Draft EIS/EIR designates at least one property within the block under which the alignment will now pass as a "Property of Concern" with respect to "Known or Suspected Hazardous Materials in Soil and/or Groundwater within 0.25 Miles of Proposed Alignments." (See Draft EIS/EIR, at 4-136 [Figure 4.9-3].) 18 cont'd

The Draft EIS/EIR also concludes that:

> "The proposed tunneling would have the potential for adverse impacts related to ground settlement and differential settlement immediately above the alignments as well as adjacent structures including the historical buildings. <u>In general, settlement is greatest at the ground surface directly above the alignment and decreases away from the centerline.</u>"

(Draft EIS/EIR, § 5.5.1 [Appendix U, Geotechnical, Subsurface and Seismic Hazards] [underline added].) While admitting that subsidence impacts are site-specific, the RDEIR does not contain even an initial review of the Project's potential to cause significant impacts from ground settlement under the new Project alignment.

Lastly, the RDEIR fails to analyze changed and potentially increased construction impacts on traffic, parking and transportation was based on the new alignment that would cross Central Avenue mid-block. The Draft EIS/EIR's analysis of construction impacts in general, and on traffic, parking, and transportation specifically, was all based on an abandoned alignment. Shifting the alignment to the north in this heavily developed area will create new significant impacts not previously analyzed. The RDEIR does not address this. 19

Traffic and parking impact analysis continue to be deficient, too. The RDEIR states that "the Regional Connector would provide new non-auto access to the area, and partially offset the parking demand in the area. However, some cumulative impacts would still remain, though they would not be significant." (RDEIR at 4.2-24.) The RDEIR provides no explanation for this conclusion nor does it identify what cumulative parking impacts would remain. Similarly, the underlying assumptions are absent: (1) what does "partially" mean; (2) what is the profile of the new Metro user who will no longer drive to the Little Tokyo area; and (3) how was this profile, assuming that there even is one, determined? The RDEIR is silent. Similarly, "[t]he LPA would have significant direct and cumulative impacts with respect to displacement and relocation. However, these impacts could be reduced or avoided through mitigation." (*Id.*, at 4.2-26.) The RDEIR's vague reference to a reduction does not tell the reader whether significant impacts will remain. This is important because Metro can only move forward with a project that will have significant impacts where there are no feasible measures that would reduce them to less than 20 21

significant. (Pub. Resources Code, § 15121(a), (15126.4(a) [EIR must describe all feasible mitigation measures to reduce a project's significant impacts].) The RDEIR fails to disclose this important information. 21 cont'd

The RDEIR Does Not Adequately Analyze Land Use Impacts. The RDEIR notes that the number of full property acquisitions would be reduced from 16 to 9 while the number of permanent underground easements has increased from 6 identified in the Draft EIR to a now proposed 26. (RDEIR at 4.2-1.) This magnifies what would appear to be a scheme to shift significantly public construction costs through the use of insidious easements on private property. The RDEIR provides no individual or cumulative analysis of the impact of these 26 permanent easements. This information must be made public before the Metro Board considers a Final EIR. 22

Mitigation Continues To Be Deferred In The RDEIR

A Draft EIS/EIR's fundamental purpose to identify how significant impacts can be mitigated or avoided. (Pub. Res. Code, §§ 21002.1, subd. (a), 21061.) In defining mitigation measures, they must be defined with sufficient specificity for the public and the decision makers to weigh their efficacy. Mitigation measures are legally inadequate when they are so undefined that their effectiveness cannot be gauged. (*San Franciscans for Reasonable Growth v. City & County of San Francisco* (1984) 151 Cal.App.3d 61, 79.) Accordingly, deferring the formulation of mitigation measures to the future, and after the project is built, is improper. "Impermissible deferral of mitigation measures occurs when an EIR puts off analysis or orders a report without either setting standards or demonstrating how the impact can be mitigated in the manner described in the EIR." *City of Long Beach v. Los Angeles Unified School Dist.* (2009) 176 Cal.App.4th 889, 915.) Despite CEQA's directives, the Draft EIS/EIR impermissibly defers mitigation. 23

The RDEIR concludes that the full take of property in Little Tokyo would result in a significant adverse effect with respect to displacement and relocation. (RDEIR at 4/2-26.) Rather than determine the scope of this impact now, Metro proposes mitigating it through a study. "Prior to construction, Metro shall conduct a parking needs assessment in Little Tokyo." (RDEIR at 4.2-27.) Metro exacerbates this issue by then relying on the unfettered discretion and later studies and "work[ing] with the City of Los Angeles to develop a parking mitigation program…." Deferring this mitigation to the unfettered discretion of a lead agency official is inadequate and "does no more than require a report to be prepared and followed, or allow approval by a county department without setting any standards." (*Endangered Habitats League v. County of Orange* (2005) 131 Cal.App.4th 777, 794.)

The RDEIR completely fails to analyze the impacts of displacing parking lots that currently meet demand for the local business community, a deficiency also contained in the Draft EIS/EIR. (*See, e.g.*, Draft EIS/EIR, App. L, at 34, 41 [discussing on-street parking only].) For example, the proposed Little Tokyo station across the street from Japanese Village Plaza currently contains a busy surface parking lot together with local businesses. The RDEIR only considers the parking impacts on surface streets and not the long term impacts of displacing existing lots. Analyzing only impacts to on-street parking, the analysis seems to presume that 24

not a single rider will arrive by car and, therefore, impacts to off-street parking need not be analyzed. The RDEIR, however, does not disclose the basis for this conclusion. Moreover, the impacts during the lengthy construction period on surrounding existing lots like that of Japanese Village Plaza are not properly analyzed or mitigated in the RDEIR. 24 cont'd

Parking impacts will also be exacerbated by obstructions to off-street parking that Metro does not take. The RDEIR proposes inadequate mitigation to address this: "Metro shall not hinder access to other public parking lots during construction." (RDEIR at 4.2-27.) What does "not hinder access" mean? To mitigate parking impacts, Metro must commit now to maintaining access to all existing off-street parking garages not used for construction during their normal hours of operation. The mitigation measure should read: "Metro shall maintain access to all public and private parking lots during construction during the parking lot's normal hours of operation." 25

To address geotechnical risks created by Metro's massive tunneling machines and subterranean construction, "[a] vibration monitoring plan shall be developed during Final Design to ensure appropriate measures are taken to avoid any damage to sensitive or historic buildings due to construction-induced vibration." (RDEIR at 4.7-41.) The Draft EIS/EIR had stated that "[d]esign criteria would be established during final design that require the construction contractor to limit movement to less than an acceptable threshold value as a performance standard. (Draft EIS/EIR, at 4-144, 4-352.) Now, Metro appears to have abandoned its attempt to develop "design criteria," and now will rely on a later-developed plan to avoid damaging sensitive buildings. Deferring the development of this plan to a later date and without design criteria out of the public eye is not enough. Metro should identify a performance standard now. (CEQA Guidelines, § 15126.4, subd. (a)(1)(B).) Deferring this plan's development to a later date violates CEQA's disclosure requirements. (*See San Joaquin Raptor Rescue Ctr. v. County of Merced* (2007) 149 Cal.App.4th 645, 670.) 26

Metro also proposes to provide advance notice to Japanese Village Plaza regarding tunneling schedules, but this does nothing to mitigate the actual vibrations that occupants would feel, or minimize the risk of damage. (*See* RDEIR at 4.7-44.) Further, as stated above, because the assumptions underlying Metro's vibration impact analysis appear to be incorrect, mitigation measures need to be adopted to reduce the potential for structural damage to Japanese Village Plaza buildings. 27

We request that Japanese Village Plaza be provided with the same mitigation measures that have been adopted for the Walt Disney Concert Hall due to the fact that certain of Japanese Village Plaza's buildings are only separated from the Project's tunnel by approximately 20 feet. Metro's plan to "conduct engineering studies during the Preliminary Engineering," should be replaced with a mitigation requiring Metro to "implement resiliently supported fasteners, isolated slab track, or other appropriate measures as needed to eliminate impacts and to reduce GBN below FTA annoyance criteria." (*Ibid.*) 28

The RDEIR also does nothing to define further Metro's measures that would "[d]escribe and define tunnel construction monitoring requirements" to mitigate settlement. (Draft EIS/EIR, 29

App. U, at 53-55.) Mitigation measures for methane gas are also not improved in the RDEIR and remain inadequate. (*Ibid.*) 29 cont'd

The Complete Draft EIS/EIR Must Be Recirculated To Cure Its Defects

To cure the significant defects in the Draft EIS/EIR and RDEIR discussed above, the *entire* Draft EIS/EIR DEIR must be revised to describe accurately the proposed Project and to analyze appropriately its environmental impacts. CEQA requires that a revised draft EIR be recirculated "[w]hen significant new information is added to an [EIR]" following public review and comment on an earlier draft. (Pub. Res. Code § 21092.1.) The public must be provided with an opportunity to review significant new information that is added to a draft EIR in order "to test, assess and evaluate the data and make an informed judgment as to the validity of the conclusions to be drawn therefrom." (*Sutter Sensible Planning, Inc. v. Bd. of Supervisors* (1981) 122 Cal.App.3d 813, 822.) 30

The RDEIR and Draft EIS/EIR suffer from numerous inadequacies, and Metro will need to incorporate significant new information in its environmental assessment of the Project in order to analyze adequately the Project's environmental impacts, and to identify alternatives and mitigation measures that are capable of alleviating those impacts. NEPA and CEQA require that this significant new information be presented to the public in the form of recirculated draft EIS/EIR so that the public has a meaningful opportunity to review and comment on the new information. (See *Laurel Heights Improvement Ass'n v. Regents of University of California* (1993) 6 Cal.4th 1112, 1130.)

Supplemental Environmental Assessment/
Recirculated Draft Environmental Impact Report
Los Angeles County Metropolitan Transportation Authority
Proposed Regional Connector Project
Los Angeles, California
GeoDesign Project: JapaneseVP-1-02

INTRODUCTION

This letter summarizes our comments regarding the Los Angeles County Metropolitan Transportation Authority (METRO) document titled *Regional Connector Transit Corridor Supplemental Environmental Assessment/Recirculated Sections of the Draft Environmental Impact Report,* dated July 22, 2011, (EIR) and geotechnical information presented in the design geotechnical report titled *Regional Connector Transit Corridor Geotechnical Report,* dated October 4, 2010.

The Regional Connector Transit Corridor Locally Preferred Alternative (LPA) requires tunneling beneath the Japanese Village Plaza site. The LPA also includes the construction of the Little Tokyo Station, which will be constructed roughly between the west property line of Central Avenue and southeast intersection of Temple and Alameda Streets and immediately to the east of the Japanese Village Plaza site.

Based on our review of the EIR and other documentation, the impacts of the LPA to the Japanese Village Plaza site are not fully evaluated and the basis of the evaluations are not consistent with the site conditions that will be present during construction.

BACKGROUND

PROPOSED REGIONAL CONNECTOR AND EXISTING DEVELOPMENT

The proposed tunnel boring operation and construction of the Little Tokyo Station will impact buildings at the Japanese Village Plaza site directly. The buildings at the Japanese Village Plaza site include a reinforced concrete parking structure and low-rise office and retail buildings, which are of wood-frame and plaster construction.

The existing parking structure contains a partial subterranean level and it is estimated that the lowest bottom of foundation level is approximately 12 feet below the adjacent ground surface level.

The LPA tunnel will pass directly beneath the existing parking structure. Based on information presented on METRO drawing (un-numbered) titled "TRACK ALIGNMENT PLAN AND PROFILE STATION 68 + 00 TO 92 + 00," the crown of the tunnel will be approximately 25 to 27 feet below the existing surface level beneath the existing parking structure. 32

This will result in a minimum clear vertical distance of approximately 13 to 15 feet from the bottom of the existing foundation to the crown of the tunneling operation.

Figure 2-18 titled "Mangrove Property Construction Area" indicates that the Little Tokyo Station construction may be within 10 feet of the existing Japanese Village Plaza parking structure and that the shoring for the station on the west side of Central Avenue will pass within the zone of influence of the Japanese Village Plaza parking structure foundations.

FUTURE DEVELOPMENT AT JAPANESE VILLAGE PLAZA

The crown elevation of the proposed LPA tunnel and METRO setback requirements would limit the subterranean development at the current site of the Japanese Village Plaza parking structure to one level. 33

The presence of the tunnel will limit the ability to build subterranean parking levels and add significant challenges to future development at Japanese Village Plaza.

GEODESIGN COMMENTS ON EIR AND GEOTECHNCIAL REPORT

Below are general comments on the geotechnical-related aspects of the LPA as they relate to the Japanese Village Plaza based on the information presented in the EIR. 34

FAULT RUPTURE

While the Japanese Village Plaza site is not within a State-designated surface fault rupture hazard zone, a portion of the proposed alignment, north of Station 85+00 and east of Alameda Street, may be within a zone of potential vertical deformation that could result in offsets of the tunnel segments.

SUBSIDENCE

Subsidence above tunnels will occur during tunneling operations. Provisions to minimize and mitigate subsidence are presented in Section 4.18.2.7 of the EIR. These methods include shoring, bracing, various grouting methods, and underpinning. Each may be a suitable method of support or increased stability at the Japanese Village Plaza site.

It is our understanding that METRO has not provided its estimate of subsidence above the tunnel at the Japanese Village Plaza. Similarly, it is our understanding that METRO has not provided a specific plan to minimize subsidence, monitor subsidence, and mitigate the potential for excessive subsidence during and post-construction at the Japanese Village Plaza.

The proximity of the Japanese Village Plaza parking structure to the proposed crown of the tunnel, approximately 13 to 15 feet, make this information particularly relevant.

35

HAZARDOUS GAS

The Japanese Village Plaza site is located in a City of Los Angeles-designated methane hazard zone. Methane gas seepage is possible at the site and the presence of the tunnel beneath the site presents a massive conduit for gas, in theory.

Section 4.18.2.6.3 of the EIR indicates general requirements for ventilation; however, it does not specifically indicate that ventilation is intended to mitigate the potential for methane or other harmful gases.

Methane mitigation measures should be identified by METRO.

36

DEWATERING

The EIR does not indicate that dewatering will be required for the tunneling beneath the Japanese Village Plaza site or construction of the Little Tokyo Station.

However, METRO should provide plans for dewatering, if planned between Stations 74+00 and 81+00.

37

EXCAVATION AND TUNNELING OBSTRUCTIONS

The only known subterranean features at the Japanese Village Plaza site are the foundation components of the existing structures, and these structures are generally at grade or slightly below grade. On-site utilities should be identified to evaluate the potential impact of the tunneling activities.

38

IMPACT FROM NOISE AND VIBRATION

EIR Section 4.7, Noise and Vibration outlines the conditions that will exist during the construction phase and also during the operation of the proposed Regional Connector. EIR Appendix R-2, Updated Locally Preferred Alternative Noise and Vibration Analysis presents the Wilson Ihrig & Associates *Noise and Vibration – Task 6.1.4.4 – Impacts at Little Tokyo Preliminary Results* dated July 12, 2011.

39

Our review of Sections 4.7 and Appendix R-2 analyzed the LPA, which requires tunneling directly below the Japanese Village Plaza property. Our review is limited to vibration that could result in damage to buildings and general construction considerations.

Vibration standards are presented in Table 4.7-4 of Section 4.7 based on the Federal Transit Administration's (FTA) guidelines, which are summarized in Table 12-3 of the *FTA Noise and Vibration Impact Assessment Manual*, May 2006 (FTA-VA-90-1003-06) based on building type and category.

We reviewed the referenced standards and compared these standards with other published information, including California Department of Transportation guidelines. The standards and thresholds referenced in the EIR for damage to buildings from vibrations are reasonable and in general accordance with Federal and State standards.

Table 4.7-5 of Section 4.7 presents the minimum calculated "safe" distances from various types of construction equipment and/or activities and subsequently a "minimum safe distance" of 21 feet was determined for all anticipated construction activities and/or operational uses.

39 cont'd

The July 12, 2011 Wilson Ihrig & Associates letter summarizes the methodology used to compute the safe distances. Table 2 of the July 12, 2011 letter titled "Construction Building Damage Effects" concludes that adverse impacts due to construction vibration will not be present at the Japanese Village Plaza site.

However, the proposed Little Tokyo Station appears to be within approximately 10 feet of the existing Japanese Village Plaza parking structure, and the tunnel boring machine operation will pass within approximately 13 to 15 feet of the Japanese Village Plaza parking structure foundations.

In each case, specific analysis regarding construction- and operational-related vibrations should be provided. For instance, our preliminary calculations indicate various equipment operating at a distance of 10 feet from the parking structure could result in vibrations on the order of 0.3 inch per second for loaded trucks to in excess of 0.8 inch per second for vibratory compactors. Each level of vibration approaches and/or exceeds the potentially damaging threshold specified in Table 4.7-4.

METRO should perform construction vibration monitoring at the Japanese Village Plaza site and implement mitigation measures as necessary and as planned for other sensitive locations.

CONSTRUCTION IMPACTS

EIR Section 4.18 summarizes the general construction activities and anticipated impact. As discussed above, the most significant construction activities identified that will impact the Japanese Village Plaza include tunnel boring machine operations beneath the Japanese Village Plaza and cut-and-cover construction of the Little Tokyo Station. Utility relocation may also impact portions of the Japanese Village Plaza site.

40

Subsidence tolerances are not provided above the tunnel boring machine operation, and monitoring and/or mitigation plans have not been discussed for the Japanese Village Plaza site. Similarly, pre-treatment, such as soil improvement by grouting methods, which is common in Los Angeles for tunneling projects similar to the LPA, is not specifically discussed for Japanese Village Plaza. 40 cont'd

Access to and use of the Japanese Village Plaza site facilities will be required in order to implement the necessary precautions and monitoring, and these activities will be on-going during the tunnel boring machine operations. 41

Cut-and-cover or other methods used for the excavation and construction of the Little Tokyo Station will require relatively deep excavations and temporary shoring to support those excavations. Based on our review of the available information, the west end of the excavation, along the west side of Central Avenue, will extend below the zone of influence of the Japanese Village Plaza parking structure foundations. 42

Provisions to provide adequate support for the parking structure foundations will be required.

The nature of the temporary shoring system is not specified in the EIR; if tieback shoring is utilized, tiebacks would extend beneath the Japanese Village Plaza site.

Tolerances, including minimum deflection, for the planned temporary shoring should be provided along with the planned method of shoring. Calculations should be provided to demonstrate that the influence of the existing foundations was properly considered in the design of the shoring system. 43

Sincerely,

Re: Regional Connector Transit Corridor Project – Route Change Impacting Japanese Village Plaza

Dear Ron:

We appreciate your recent meeting with us, along with other members of the Metro team, so that our client, Japanese Village, LLC, could understand better the impacts created by the Regional Connector's proposed change in alignment to tunnel under our client's property. As you know, that alignment was not studied in the project's Draft EIR/EIS and Metro has determined they cannot provide detailed information to our client about the depth and location of the new proposed tunnel alignment. Because impacts were not studied in the Draft EIR, our client has retained expert engineers to provide information, but they have advised they cannot provide analysis of the impacts without the necessary information from Metro. 44

While we appreciate the provision of information from similar projects on Metro's Eastside Extension, and Metro's efforts to try to respond to Japanese Village's concerns over the redesigned and unstudied alignment, without adequate details our client cannot support the proposed alignment change. As we have advised your team in detail, Japanese Village has just completed a multimillion dollar reinvestment. The location of the proposed tunnel under the parking garage would preclude the future expansion and improvements previously targeted for that area.

We now understand that Metro has determined it is unable to provide detailed information on impacts created by the project change and is moving ahead with the new project alignment without recirculating further CEQA or NEPA review for public comment. As discussed with you, our client believes that Metro's decision not to conduct further environmental review on the proposed route change is not consistent with both these statutes' respective goals of public disclosure and informed decision making. 45

As Japanese Village's ownership has made clear, it supports public transit that furthers the interests of Little Tokyo and its businesses and residents. However, as set forth in

Attachment A, Japanese Village has significant concerns over impacts on its property created by the revised project that have not been analyzed or made available for public comment under either CEQA or NEPA. This analysis should take place now and be made available to the public and the decision makers before this route change is made as part of the Regional Connector project.

ATTACHMENT A

First indicated in a small post on Metro's blog in January 2011, it was only in June of this year that that Metro provided any detail on its plan to under the heavily developed block bounded by 1st Street, San Pedro Street, 2nd Street, and Central Avenue (the "June 2011 Proposal"). This June 2011 Proposal was certainly not the original project, nor was it one of the Draft EIS/EIR's alternatives. The June 2011 Proposal was not analyzed at all, and the Draft EIS/EIR needs to be revised and recirculated for reasons described below. 46

The reason Japanese Village, LLC had not previously commented upon the Draft EIS/EIR when it was out for public circulation is that the Regional Connector tunnel did not appear to run under Japanese Village property until the June 2011 Proposal.

The Draft EIS/EIR Fails to Set Forth a Proper Project Description

Cal. Admin Code, tit. 14, § 15124 provides:

> The description of the project shall contain the following information . . .
>
> (a) The **precise location and boundaries of the proposed project** shall be shown on a detailed map, preferably topographic. The location of the project shall be shown on a detailed map, preferably topographic.
>
> (c) A general description of **the project's technical, economic, and environmental characteristics**, considering the principal engineering proposals if any and supporting public service facilities. (CEQA Guidelines, § 15124 [emphasis added].)

47

The Draft EIS/EIR lacks a "precise location and boundaries" map and lacks a "general description of the project's technical characteristics."

Section 1.6.2 of the Draft EIS/EIR attempts a textual project description by saying that "[b]y 2035, the Metro rail system is proposed to be expanded to the north and east with extensions to the Gold Line and to the west with extensions to the Purple and Expo Lines and the addition of the Crenshaw Line." Figure 1-1, Project Area, shows the existing locations for the Metro Gold Line, Metro Red and Purple Lines, Metro Blue and Expo Lines, but nowhere is there either a map or a textual description to explain how the project will connect these existing lines. 48

Figure 1-2, "Existing and Proposed Metro Rail Lines in 2035," rather than being a "precise location" map shows the "Regional Connector" in only vague terms, with an apparent scale of one inch to two miles. A reader cannot read Figure 1-2 to determine how the Regional Connector will connect existing lines, in terms of streets, buildings and properties affected. 49

The first time the reader gains an understanding of possible routes is in Chapter 2, Alternatives Considered. Figure 2-1 contains a map that combines three apparent alternative 50

alignments. Figure 2-3 portrays the TSM Alternative,[1] Figure 2-9 the At-Grade Emphasis LRT Alternative, Figure 2-9 the Underground Emphasis LRT Alternative, Figure 2-10 the Fully Underground LRT Alternative, with variations of these at Figures 2-11, 2.12, and 2-13. 50 cont'd

The technical appendices make no attempt to state a preferred project, much less describe the June 2011 Proposal. (Technical Appendix II, foldout: "Regional Connector Transit Corridor Draft Conceptual Plans and Profiles: December 18, 2009.") 51

Thus, there is not a single route described as the project from which alternatives may be judged. CEQA requires that an EIR identify feasible alternatives that could avoid or substantially lessen the project's significant environmental impacts. (Pub. Res. Code, §§ 21002, 21002.1, subd. (a), 21100, subd. (b)(4).) The Draft EIS/EIR here skips the project definition. 52

A project proponent does not satisfy CEQA's requirement for "precise location and boundaries" by providing location and boundaries for three to five alternatives. Exactly how does one measure an alternative's strengths and weaknesses without a project description? "[A]n accurate stable and finite project description is the sine qua non of an informative and legally sufficient EIR." (*San Joaquin Raptor Rescue Center v. County of Merced* (2007) 149 Cal.App.4th 645, 655 (*"San Joaquin Raptor II"*) (quoting *County of Inyo v. City of Los Angeles* (1977) 71 Cal.App.3d 185, 193.) Furthermore "[a]n accurate project description is necessary for an intelligent evaluation of the potential environmental effects of a proposed activity." (*Silveira v. Las Gallinas Valley Sanitary District* (1997) 54 Cal.App.4th 980, 990 (citation omitted).) Under NEPA, the "EIS process should serve both to alert the public of what the agency intends to do and give the public enough information to be able to participate intelligently in the EIS process." (*California v. Block* (9th Cir. 1982) 690 F.2d 753, 772.) Thus, an EIS must "properly define[]" (40 C.F.R. §1502.4(a)) the proposed project and provide a "clear presentation of the alternatives including the proposed action." (*Id.*, § 1502.10.) 53

The Regional Connection's Draft EIS/EIR resembles the problems presented in *County of Inyo v. City of Los Angeles*. The project there was defined merely as an increase in water pumping rates from subsurface water in Owens Valley. The EIR, however, discussed far broader concepts, such as canal work, a conservation program, reduction of stockwater and reservoir operations. (71 Cal.App.3d, at 190.)

> A curtailed or distorted project description may stultify the objectives of the reporting process. Only through an accurate view of the project may affected outsiders and public decision-makers balance the proposal's benefit against its environmental cost, consider mitigation measures, assess the advantage of terminating the proposal (i.e., the 'no project' alternative) and weigh other alternatives in the balance. An accurate, stable and finite project description is the sine qua non of an informative and legally sufficient EIR.

---

[1] The TSM is merely a Transportation Systems Management Alternative, which proposes only the construction of bus stops. (Draft EIS/EIR, App. FF, at 15.) 50 cont'd

(*Id.*, at 192-93.) In *County of Inyo,* the "incessant shifts among different project descriptions do vitiate the City's EIR process as a vehicle for intelligent public participation." (*Id.*, at 197.) "The defined project and not some different project must be the EIR's bona fide subject." (*Id.*, at 199.) "Because the Final EIR['s . . .] list of alternatives is not tied to a reasonably conceived or consistently viewed project, the Los Angeles EIR does not comply with CEQA's demand for meaningful alternatives." (*Id.*, at 203.)

53 cont'd

The Regional Connector Draft EIS/EIR leads with the Transportation Systems Management Alternative, which proposes only the construction of bus stops. (Draft EIS/EIR, App. FF, at 15.) But the June 2011 Proposal selects much more, and selects nothing studied in the Draft EIS/EIR.[2]

The DRAFT EIS/EIR Has Not Studied the Impacted Area Around Japanese Village

For the very reason there was no adequate project description, the Draft EIS/EIR has failed to assess project impacts upon the Japanese Village. The Draft EIS/EIR analyzes the project's impacts in the following categories: Displacement and Relocation of Existing Uses, Community and Neighborhood Impacts, Visual and Aesthetic Impacts, Climate Change, Noise and Vibration, Ecosystems/Biological Resources, Geotechnical/Subsurface/Seismic/Hazardous Materials, Water Resources, Energy, Historic – Built Environment, Historic – Archaeology, Parklands and Other Community Facilities, Economic and Fiscal Impacts, Safety and Security, and Growth-Inducing Impacts. The Draft EIS/EIR admits that many of these potentially significant impacts are site specific, yet the agency is poised to move ahead with a final EIS/EIR without analyzing or giving the public the opportunity to comment on the June 2011 Proposal. A *post hoc* review done to determine these impacts is exactly what CEQA and NEPA are designed to prevent.

54

---

[2] Further, Metro, as "the lead agency plays a pivotal role in defining the scope of environmental review, lending its expertise in areas within its particular domain, and in ultimately recommending the most environmentally sound alternative." (*Kings County Farm Bureau v. City of Hanford* (1990) 221 Cal.App.3d 692.) Rather than define a proposed project, from which many key CEQA and NEPA obligations then build upon, the agency has abdicated this role to a later point in time. (*See* Draft EIS/EIR, at 2-1 ["Depending on which alternative is selected…"].) By defining a range of alternatives only, and not a precise project, Metro has also violated CEQA's and NEPA's respective goals of an informed public. (Pub. Res. Code, § 21003(b) [EIRs should be organized and written in a manner that will make them "meaningful and useful to decision-makers and to the public."]; *Berkeley Keep Jets Over the Bay Committee v. Bd. of Port Commissioners* (2001) 91 Cal.App.4th 1344, 1355 ["A prejudicial abuse of discretion occurs if the failure to include relevant information precludes informed decision making and informed public participation."]; (40 C.F.R. §§1502.4, subd. (a), 1502.10 [an EIS must "properly define[]" the proposed project and provide a "clear presentation of the alternatives including the proposed action."]; *id.* § 1502.8. [an EIS . . . must . . . "be written [. . .] so that decisionmakers and the public can readily understand [it]."].)

53 cont'd

In evaluating land use impacts, the Draft EIS/EIR concludes that: "To construct the Underground Emphasis LRT Alternative, partial takings of 11 parcels, full takings of 10 parcels, permanent easements across 4 parcels, and temporary easements across 8 parcels would be needed for the construction of LRT facilities." (Draft EIS/EIR, at 4-16; *see* Table 4.2-4 [enumerating impacts parcels and identifying extent of potential take]; *see also id.*, at 4-24 (examining significant adverse impacts from dislocation and relocation from the Fully [underground LRT Alternative].) Because no alternative of underground alignment analyzed in the Draft EIS/EIR passes under the June 2011 Proposal, the document contains no analysis of the potentially significant displacement and relocation impacts relating to this proposal. Any displacement or relocation would constitute a new significant impact requiring the Draft EIS/EIR's recirculation. 55

Noise and vibration impacts are highly localized. The Draft EIS/EIR analyzes noise and vibration impacts at specific locations along the proposed routes and alternatives, but because the Draft EIS/EIR does not analyze an alternative that passes along the June 2011 Proposal's alignment, potentially significant noise and vibration impacts to this block were not analyzed. These potentially significant impacts should be analyzed now and made available for public review. 56

Section 4.9 of the Draft EIS/EIR analyzes Geotechnical/Subsurface/Seismic/Hazardous Materials impacts on a site specific basis as well.

> [T]he project area would be susceptible to the potential spread of contaminated groundwater and release of subsurface oilfield gases. Also, the Fully Underground LRT Alternative would require more property acquisition and demolition of existing structures, which could heighten the risk of potential release of asbestos fibers and lead-based paint particles.

(Draft EIS/EIR, § 4.9.3.5.2 [Hazardous Materials].) 57

Since no alternative was proposed to pass under the June 2011 Proposal, no analysis was conducted of the project's potential to increase significantly this environmental impact. This analysis is especially important here because the Draft EIS/EIR designates at least one property within the block under which the alignment will now pass as a "Property of Concern" with respect to "Known or Suspected Hazardous Materials in Soil and/or Groundwater within 0.25 Miles of Proposed Alignments." (See Draft EIS/EIR, at 4-136 [Figure 4.9-3].) Additional environmental analysis of the site-specific hazardous and geotechnical impacts to this area are required, and the results of these analysis must be circulated for public review and comment before any final action is taken on the Project.

The Draft EIS/EIR also concludes that:

> "The proposed tunneling would have the potential for adverse impacts related to ground settlement and differential settlement immediately above the alignments as well as adjacent structures 58

> including the historical buildings. In general, settlement is greatest at the ground surface directly above the alignment and decreases away from the centerline."

(Draft EIS/EIR, § 5.5.1 [Appendix U, Geotechnical, Subsurface and Seismic Hazards] [underline added].) 58 cont'd

The Draft EIR/EIS admits that these subsidence impacts are site-specific, yet Metro has not completed even an initial review of the Project's potential to cause significant impacts from ground settlement within the June 2011 Proposal. Review must be done now to determine whether there are any additional significant impacts and to define mitigation measures to address them. In fact, geotechnical analysis along the entire length of the proposed route is only now occurring, when it should have taken place before the Draft EIS/EIR was published and been a part of the project description and description of the environment.

The Draft EIS/EIR's analysis of construction impacts on traffic, parking and transportation was based on an alignment that utilized the right-of-way along Second Street, and did not cross Central Avenue mid-block. The Draft EIS/EIR's analysis of construction impacts in general, and on traffic, parking, and transportation specifically, was all based on this old alignment. Shifting the alignment to the north in this heavily developed area may create different or new significant impacts not previously analyzed. The Draft EIS/EIR should be revised and recirculated so that these impacts can be publicly reviewed and commented on. 59

Historic resources are also potentially significantly impacted by this alignment change. Figure 4.12-7 indicates that there are at least four existing structures under which the June 2011 Proposal may pass that were built before 1968. Impacts to these resources from increased vibration as a result of tunneling directly under these structures has not been analyzed. These potentially significant impacts must be considered now, and presented to the public for review and comment in a recirculated Draft EIS/EIR 60

There Is No Environmentally Superior Alternative Identified

The failure to provide a project description led to the Draft EIS/EIR's failure to identify an environmentally superior alternative – one of CEQA's most basic requirements. CEQA requires an EIR to identify and discuss feasible alternatives to a proposed project. (Pub. Res. Code, §§ 21002, 21002.1(a), 21061, 21100(b)(4).) Of the alternatives considered, the CEQA Guidelines require that an EIR identify the "environmentally superior alternative," which assists decision makers in considering a project approval. (See Cal. Admin. Code, tit. 14, §§ 15126.6(a), (e)(2).) 61

Here, the Draft EIS/EIR only describes the alternatives considered, but it does not identify an environmentally superior alternative that would minimize the Regional Connector's significant environmental effects. (*See* Draft EIS/EIR, pp. 2-1 to 2-17.) Under CEQA, a proper analysis of alternatives is essential to comply with CEQA's mandate that significant environmental damage be avoided or substantially lessened where feasible. (Pub. Res. Code, § 21002; Cal. Admin. Code, tit. 14, §§ 15002(a)(3), 15021(a)(2).) The Draft EIS/EIR's failure to

disclose an environmentally superior alternative is prejudicial, and the Draft EIS/EIR should be recirculated so that the public has an opportunity to comment on an identified project that Metro concludes is the environmentally superior alternative for meeting the project goals and needs defined in the Draft EIS/EIR. 61 cont'd

The Draft EIS/EIR Lacks A Proper Baseline

Under CEQA, "[a]n EIR must focus on impacts to the existing environment, not hypothetical situations." (*Sunnyvale W. Neighborhood Ass'n v. City of Sunnyvale* (2010) 190 Cal.App.4th 1351, 1373; *see also Environmental Planning & Information Council* v. *County of El Dorado* (1982) 131 Cal.App.3d 350, 352–355; *County of Amador v. El Dorado County Water Agency* (1999) 76 Cal.App.4th 931, 955.) "It is only against this baseline that any significant environmental effects can be determined. (CEQA Guidelines, §§ 15125, 15126.2, subd. (a).)" (*Id.*, at 952.) "[U]sing hypothetical allowable conditions as the baseline results in 'illusory' comparisons that 'can only mislead the public as to the reality of the impacts and subvert full consideration of the actual environmental impacts,' a result at direct odds with CEQA's intent." (*Communities for a Better Env. v. S. Coast Air Quality Management District* (2010) 48 Cal.4th 31, 322.) 62

Here, while the air quality impacts analysis acknowledges that CEQA requires determining a project's significance based on "existing conditions at the time the project NOP was published," it eschews this analysis for one that compares "the difference between a project alternative (2035) and the 2009 Baseline **adjusted for regional growth that would occur by 2035**." (Draft EIS/EIR, App. Q, at 17 [emphasis added].) This "adjusted baseline" violates CEQA because it does not focus on "impacts to the existing environment," but rather "hypothetical [future] situations." (*Sunnyvale*, 190 Cal.App.4th, at 1373.)

The Draft EIS/EIR's analysis of traffic impacts suffers from the same defect – failure to analyze the significance of the Project's impact against existing conditions. To assess the "project's" traffic impacts, the Draft EIS/EIR assumes a set of future conditions based on "forecasts…developed for the horizon year of 2035" and compares the "project" against these future conditions to measure the significance of impacts. (Draft EIS/EIR, App. L, at 15.) Although existing conditions were discussed in the Draft EIS/EIR, the Draft EIS/EIR never compared the "project's" impacts against these existing physical conditions. (*See, e.g.*, *id.*, at 58-70 [analyzing impacts against future, hypothetical 2035 traffic conditions].)

In *Sunnyvale*, the court rejected this exact methodology. There, the EIR used hypothetical future traffic network and volumes used by planning agencies as its "baseline" to evaluate the roadway project's traffic and related impacts. (*Id.*, 190 Cal.App.4th, at 1379 [using "projected conditions in the year 2020, more than a decade after approval, as the 'baseline' against which to assess the traffic and related impacts of the proposed project."].) The court held that this violated CEQA, because "a straightforward assessment of the impacts produced by the project alone on the existing environment is the foundational information of an EIR." (*Id.*, at 1382.) The agency's failure was a prejudicial abuse of discretion because "[e]valuation of the [] project under those projected worse traffic conditions of the future obscures the existence and severity of adverse impacts that would be attributable solely to the project under the existing 63

conditions..." (*Id.*, at 1388.) Here, too, Metro's decision to analyze what the traffic impacts might be in 2035 and long after the "project," whatever it is, is built is similarly an abuse of discretion. 63 cont'd

Mitigation Has Been Deferred

The Draft EIS/EIR's fundamental purpose to identify how significant impacts can be mitigated or avoided.[3] (Pub. Res. Code, §§ 21002.1, subd. (a), 21061.) In defining mitigation measures, they must be defined with sufficient specificity for the public and the decision makers to weigh their efficacy. Mitigation measures are legally inadequate when they are so undefined that their effectiveness cannot be gauged. (*San Franciscans for Reasonable Growth v. City & County of San Francisco* (1984) 151 Cal.App.3d 61, 79.) Accordingly, deferring the formulation of mitigation measures to the future, and after the project is built, is improper. "Impermissible deferral of mitigation measures occurs when an EIR puts off analysis or orders a report without either setting standards or demonstrating how the impact can be mitigated in the manner described in the EIR." *City of Long Beach v. Los Angeles Unified School Dist.* (2009) 176 Cal.App.4th 889, 915.) Despite CEQA's directives, the Draft EIS/EIR impermissibly defers mitigation. 64

The Draft EIS/EIR concludes that the full take of property in Little Tokyo would result in a significant adverse effect with respect to environmental justice. (*See generally* Draft EIS/EIR, § 4.17; *id.*, at 4-23.) Rather than determine the scope of this impact now, Metro proposes mitigating it through a study. "Prior to construction, Metro would conduct a parking analysis of the Little Tokyo area to determine parking capacity and if temporary or permanent displacement of parking would affect this capacity" and "would consider replacing displaced parking." (*Id.*, at 4-30, 4-308.) This violates CEQA because instead of analyzing the impact and committing to specific action to mitigate it now, Metro is relying on the unfettered discretion of its employee to determine whether capacity is "affected," and then leaves it up to the same staff to "consider 65

---

[3] Note that the Draft EIS/EIR also defers actual analysis of impacts. For example, rather than determine what the electro-magnetic field impacts will be now, the Draft EIS/EIR states that studies will be done later to determine what these impacts are. (*See* Draft EIS/EIR, at 4-147 ("Although potential impacts related to very weak EMFs that would be created by the build alternatives would not be anticipated, additional evaluation of sensitive receptors, including residences, schools, hospitals, day care facilities, and convalescent homes within 100 feet of the proposed alignments, would be warranted. Projected EMF levels produced by the LRT would be compared with International Radiation Protection Association guidelines. If these guidelines are exceeded, mitigation would be implemented to ground or block EMFs or modify the LRT power requirements.") This violates both CEQA and NEPA. Under NEPA, an EIS must provide a "full and fair discussion" of a project's significant environmental impacts by compiling and analyzing all relevant data. (40 C.F.R. §§1500.1, 1502.1; *Sierra Club v. U.S. Forest Service* (9th Cir. 1988), 843 F.2d 1190, 1195.) CEQA requires that an EIR identify and analyze potentially significant environmental impacts. (*See* Cal. Admin. Code, tit. 14, § 15126.2, subd. (a).) 64 cont'd

replacing" it.[4] Deferring this mitigation to the unfettered discretion of a lead agency official is inadequate and "does no more than require a report to be prepared and followed, or allow approval by a county department without setting any standards." (*Endangered Habitats League v. County of Orange* (2005) 131 Cal.App.4th 777, 794.) 65 cont'd

Similarly, to address geotechnical risks created by Metro's massive tunneling machines and subterranean construction, "[d]esign criteria would be established during final design that require the construction contractor to limit movement to less than an acceptable threshold value as a performance standard. (Draft EIS/EIR, at 4-144, 4-352.) Deferring the development of design criteria to a later date is not enough. Rather than identify a performance standard that could be achieved in various ways, which is permissible under CEQA (CEQA Guidelines, § 15126.4, subd. (a)(1)(B)), Metro has improperly deferred its development. Metro has provided no reason why this criteria could not be developed now, and its failure to do violates CEQA's disclosure requirements. (*See San Joaquin Raptor Rescue Ctr. v. County of Merced* (2007) 149 Cal.App.4th 645, 670.) Metro's measures that would "[d]escribe and define tunnel construction monitoring requirements" to mitigate settlement, and mitigation measures for methane gas are also improperly deferred and not satisfactorily described. (Draft EIS/EIR, App. U, at 53-55.) 66

The Project Has Been Piecemealed

Despite identifying the need to relocate numerous buildings and structures as a result of any one of the discussed alternatives and future development opportunities on property that Metro is acquiring for construction purposes, Metro has not analyzed the impacts of these projects together with the impacts from the Regional Connector. (*See* Draft EIS/EIR, at 4-28 ["Upon completion of construction, property needed for construction but not required to maintain the physical infrastructure, or necessary for access would be included in Metro Joint Development Program for possible development. A development would be environmentally and separately cleared from this project and would undergo its own community input process."], 4-12 to 4-30 [discussing partial and full takes, which would require relocation of existing businesses].) This is improper under both NEPA and CEQA, and it is not enough that these projects, which will only occur because of the Regional Connector, will undergo separate environmental review. 67

Under NEPA, connected actions must be considered together in the same EIS. (40 C.F.R. § 1508.25; *Thomas v. Peterson* (9th Cir. 1985) 753 F.2d 754, 758-9.) Connected actions are those that (1) "[a]utomatically trigger" other actions potentially requiring EISs; (2) "cannot or will not proceed unless other actions are taken previously or simultaneously;" or (3) are "interdependent parts of a larger action and depend on the larger action for their justification." (40 C.F.R. §1508.25.) Courts apply an "independent utility" test under NEPA to "determine whether multiple actions are so connected as to mandate consideration in a single EIS." (*Great* 68

---

[4] The Draft EIS/EIR also fails because it does not analyze impacts of eliminating off-street parking. (*See, e.g.,* Draft EIS/EIR, App. L, at 34, 41 [discussing on-street parking only].) Analyzing only impacts to on-street parking, the analysis seems to presume that not a single rider will arrive by car and, therefore, impacts to off-street parking need not be analyzed. The Draft EIS/EIR, however, does not disclose the basis for this conclusion. 65 cont'd

Basin Mine Watch v. Hankins (9th Cir. 2006) 456 F.3d 955, 969.) Similarly, under CEQA a public agency "may not divide a single project into smaller individual projects to avoid its responsibility to consider the environmental impacts of the project as a whole." (*Sierra Club v. West Side Irrigation Dist.* (2005) 128 Cal.App.4th 690, 698.) An accurate EIR must ensure that "environmental considerations do not become submerged by chopping a large project into many little ones – each with a minimal potential impact on the environment – which cumulatively may have disastrous consequences." (*Bozung v. Local Agency Formation Comm'n of Ventura County* (1975) 13 Cal.3d 263, 283-84.) Accordingly, "an EIR must include an analysis of the environmental effects of future expansion or other action if: (1) *it is a reasonably foreseeable consequence of the initial project*; and (2) the future expansion or action will be significant in that it will likely change the scope or nature of the initial project or its environmental effects." (*Laurel Heights Improvement Assn. v. Regents of University of California* (1988) 47 Cal.3d 376, 396.)

68 cont'd

The redevelopment of property not required to operate the Regional Connector is a connected action under NEPA and a "reasonably foreseeable consequence of" the Regional Connector under CEQA. But for Metro's acquisition of these sites for the Regional Connector, there would be no property to contribute to the "Metro Joint Development Program for possible development." (Draft EIS/EIR, at 4-28.) Similarly, because Metro recognizes now that certain property it is acquiring for the Regional Connector will not be necessary for its operation and it intends to contribute it to its development program, it is reasonably foreseeable that these properties will be developed by Metro. Impacts from this development should have been included in the Draft EIS/EIR, and because it was not the Draft EIS/EIR should be revised and recirculated now so that it presents an accurate picture of the project's impacts to the public and decisionmakers.[5]

69

The Draft EIS/EIR Must Be Recirculated

70

For all the foregoing reasons, the Draft EIS/EIR must be repaired and recirculated.

---

[5] Metro further disguises the Regional Connector's impacts by failing to complete a programmatic EIS/EIR for its aggressive rail expansion. Under CEQA, a program EIR is required when individual projects together comprise a single project, or an individual project is to be implemented in multiple phases. (CEQA Guidelines, § 15165.) Similarly, NEPA requires s programmatic EIS be prepared whenever "proposals or parts of proposals which are related to each other closely enough to be, in effect, a single course of action shall be evaluated in a single impact statement." (40 C.F.R. § 1502.4, subd. (a); *see City of Tenakee Springs v. Clough* (9th Cir. 1990) 915 F.2d 1308, 1312-13; *see also LaFlamme v. Fed. Energy Regulatory Comm.* (9th Cir. 1988) 852 F.2d 389, 401-02 (9th Cir. 1988) (holding that a cumulative impacts analysis was insufficient where the agency had examined single projects in isolation because there were several foreseeable similar projects in a geographical region that added to the cumulative impacts).

69 cont'd

R-BU7

Responses to Comments from Latham & Watkins LLP on behalf of Japanese Village, LLC, Crockett, Robert D.

Response to Comment R-BU7-1

Impacts to the Japanese Village Plaza associated with the proposed Regional Connector project were thoroughly analyzed and disclosed in the Supplemental EA/Recirculated Draft EIR Sections. As Metro indicated to the commenter in June 2011, information regarding the depth and location of the tunnel was adequate to analyze impacts for purposes of the Supplemental EA/Recirculated Draft EIR Sections. Additional detail regarding project design that will be developed as the design is finalized will reflect the level of impacts disclosed in the Supplemental EA/Recirculated Draft EIR Sections. Metro's environmental review process has been thorough and detailed resulting in a full disclosure of impacts and is in compliance with both CEQA and NEPA. In accordance with CEQA and NEPA, each alternative's potential to result in short- and long-term, direct, indirect, and cumulative impacts on the environment, as well as economic and environmental justice impacts, was evaluated in Chapter 3 through 5 of the EIS/EIR. Please refer to Responses to Comments R-BU7-2 through R-BU7-70, which include supporting information from the EIS/EIR, to specific comments raised in this letter. Metro is committed to address financial property-related issues important to individual property owners as project implementation, including acquisition of easements, proceeds. Refer to Responses to Comments R-BU7-44 and R-BU7-45, below, for responses to commenter's referenced "Attachment C".

Response to Comment R-BU7-2

The Supplemental EA/Recirculated Draft EIR Sections thoroughly addressed all potential impacts in compliance with CEQA and NEPA. A property easement from the Japanese Village Plaza would be required in order to construct the tunnel as part of the Locally Preferred Alternative. Impacts on the Japanese Village Plaza, such as ground-borne noise generated during construction and operation, were appropriately identified and disclosed in the Supplemental EA/Recirculated Draft EIR Sections. There would be no partial take of the Japanese Village Plaza property under the Locally Preferred Alternative and the existing parking and retail structures on the parcels would remain in place. As indicated in Section 4.2, Displacement and Relocation, of the Supplemental EA/Recirculated Draft EIR Sections and this Final EIS/EIR, subsurface easements would not result in significant impacts/adverse effects because they do not involve displacement or acquisition of surface area. Displacement impacts were analyzed in accordance with CEQA and NEPA, which require analysis of the project's potential to displace housing, people, or businesses. A reasonably foreseeable project is one where the applicant has devoted significant time and financial resources to prepare for any regulatory review (Gray v. County of Madera 2008). Future development beneath the Japanese Village Plaza parcel, that would require use of the area indicated for the subsurface easement to accommodate the Locally Preferred Alternative, is currently not reasonably foreseeable. The subsurface easement would not preclude future development beneath the entire parcel; only future underground development within the area of the easement would be precluded. In addition, the subsurface easement would not preclude any aboveground future development on the parcel. Metro would provide compensation for the easement in compliance with the Uniform Relocation Assistance and Real Property Acquisition Policies Act of 1970 (Uniform Act)

as indicated in mitigation measure number DR-8 in the Mitigation Monitoring and Reporting Program for the Locally Preferred Alternative (Chapter 8 of this Final EIS/EIR). Issues related to the valuation/cost of the easement would be negotiated with the property owner by Metro during project implementation.

Response to Comment R-BU7-3

The Locally Preferred Alternative was thoroughly and clearly described in the Supplemental EA/Recirculated Draft EIR Sections (see responses below). Potential impacts associated with the project were adequately and clearly analyzed and disclosed in Chapter 3, Transportation Impacts and Mitigation, and Chapter 4, Environmental Analysis, Consequences, and Mitigation of the Draft EIS/EIR and this Final EIS/EIR, and the sections included in the Supplemental EA/Recirculated Draft EIR Sections. No piecemeal approach has been taken. All components of the project have been described and analyzed in the Draft EIS/EIR, Supplemental EA/Recirculated Draft EIR Sections, and this Final EIS/EIR. Refinements to the Locally Preferred Alternative since publication of the Draft EIS/EIR have been described and analyzed in the Supplemental EA/Recirculated Draft EIR Sections and this Final EIS/EIR.

Significant impacts and adverse effects were adequately analyzed and mitigation measures to reduce significant impacts/adverse effects to the maximum extent feasible were identified in Chapter 3, Transportation Impacts and Mitigation, and Chapter 4, Environmental Analysis, Consequences, and Mitigation of the Draft EIS/EIR and this Final EIS/EIR, and the sections included in the Supplemental EA/Recirculated Draft EIR Sections (see below for specific responses). The Draft EIS/EIR identified candidate mitigation measures for each alternative where significant impacts/adverse effects would occur. Appropriate candidate mitigation measures identified in the Draft EIS/EIR have been refined and confirmed in the Mitigation Monitoring and Reporting Program for the Locally Preferred Alternative (Chapter 8 of this Final EIS/EIR). Please refer to Responses to Comments R-BU7-31 through R-BU7-43, below, for responses to commenter's referenced "Attachment B".

Response to Comment R-BU7-4

A range of alternatives were equally described and evaluated in the EIS/EIR, as required under NEPA (40 CFR 1502.14), as well as the Federal Transit Administration (FTA) NEPA implementing regulations (23 CFR 771.105(b), 771.123(c) and 771.125(a)). The approach of including alternatives at an equal level of review, as required by NEPA, does not violate CEQA because the description of each alternative and evaluation of potential impacts associated with each alternative meet CEQA requirements. The following alternatives were evaluated in the EIS/EIR for potential environmental, economic, and social impacts: No Build Alternative, TSM Alternative, At-Grade Emphasis LRT Alternative, Underground Emphasis LRT Alternative, and the Fully Underground Light Rail Transit (LRT) Alternative. The description of alternatives is provided in Section 2.3 of the Draft EIS/EIR, Supplemental EA/Recirculated Draft EIR Sections, and this Final EIS/EIR. On October 28, 2010, the Metro Board of Directors voted to designate the Fully Underground LRT Alternative without the Flower/5th/4th Street station as the Locally Preferred Alternative. Section 2.3.6 of the Supplemental EA/Recirculated Draft EIR Sections and this Final EIS/EIR includes an accurate, stable, finite, and clear description of the Locally Preferred Alternative (the proposed project). The Locally Preferred Alternative alignment would extend underground from the 7th Street/Metro Center Station under Flower Street to 2nd Street.

Tracks would then proceed east underneath the 2nd Street Tunnel and 2nd Street to just west of Central Avenue. At 2nd Street and the pedestrian signal to the Japanese Village Plaza, the tracks would continue underground heading northeast under the Japanese Village Plaza and 1st and Alameda Streets. To the east and north of the rail junction beneath 1st and Alameda Streets, tracks would rise to the surface through two new portals in order to connect to the existing Metro Gold Line. The portals would be located on the northeast corner of 1st and Temple Streets, and in the median of 1st Street between Alameda and Garey Streets.

Sufficient detail was provided in the description of all the alternatives, including the Locally Preferred Alternative, in order to adequately evaluate the potential environmental, economic, and social impacts associated with each alternative.

Response to Comment R-BU7-5

Please refer to Response to Comment R-BU7-4, above. The approach of including alternatives at an equal level of review, as required by NEPA, does not violate CEQA because the description of each alternative and evaluation of potential impacts associated with each alternative meet CEQA requirements and CEQA does not preclude this type of analysis. The beginning of Chapter 2, Alternatives Considered, of the Supplemental EA/Recirculated Draft EIR Sections and this Final EIS/EIR discusses the designation of the Fully Underground LRT Alternative without the Flower/5th/4th Street station as the Locally Preferred Alternative and refinements since publication of the Draft EIS/EIR, and refers the reader to Section 2.3.6 for further description of the Locally Preferred Alternative. The Locally Preferred Alternative is clearly and definitively identified as the proposed project in the Supplemental EA/Recirculated Draft EIR Sections and this Final EIS/EIR.

Response to Comment R-BU7-6

The description of the Locally Preferred Alternative in Chapter 2, Alternatives Considered, of the Supplemental EA/Recirculated Draft EIR Sections and this Final EIS/EIR meets the requirements of Section 15124 of the CEQA Guidelines.

- The "precise location and boundaries of the proposed project are shown on a detailed map." (CEQA Guidelines, § 15124, subd. (a).) The various figures in Chapter 2 adequately depict the proposed project location.

- "The location of the project shall also appear on a regional map." (CEQA Guidelines, § 15124, subd. (a).) The regional maps in Chapter 1, Purpose and Need, satisfy this requirement.

- "A general description of the project's technical, economic, and environmental characteristics, considering the principal engineering proposals if any and supporting public service facilities." (CEQA Guidelines, § 15124, subd. (c).) The description of the project in Chapter 2 clearly address this requirement.

- "A statement of the objectives sought by the proposed project." (CEQA Guidelines, § 15124, subd. (b).) The goals and objectives are set forth in Chapter 1, Purpose and Need.

- The following are included in Section 2.6, Environmental Process, and Section 4.22, Anticipated Permits and Approvals, of this Final EIS/EIR: A statement briefly describing the intended uses of the EIR." (CEQA Guidelines, § 15124, subd. (d).) This statement shall include:

  - A list of the agencies that are expected to use the EIR in their decision-making, and

  - A list of permits and other approvals required to implement the project.

  - A list of related environmental review and consultation requirements required by federal, state, or local laws, regulations, or policies. To the fullest extent possible, the lead agency should integrate CEQA review with these related environmental review and consultation requirements.

  - And, "if a public agency must make more than one decision on a project, all its decisions subject to CEQA should be listed, preferably in the order in which they will occur." (CEQA Guidelines, § 15124, subds. (d)(1) and (2).)

Response to Comment R-BU7-7

Please refer to Response to Comment R-BU7-4, above. A range of alternatives were equally described and evaluated in the EIS/EIR. Each alternative is described in Section 2.3 of the Draft EIS/EIR, Supplemental EA/Recirculated Draft EIR Sections, and this Final EIS/EIR. As indicated in the beginning of Chapter 2, Alternatives Considered, and Section 2.3.6 of the Supplemental EA/Recirculated Draft EIR Sections and this Final EIS/EIR, the Metro Board of Directors voted on October 28, 2010, to designate the Fully Underground LRT Alternative without the Flower/5th/4th Street station as the Locally Preferred Alternative. The Locally Preferred Alternative is described in Section 2.3.6 of the Supplemental EA/Recirculated Draft EIR Sections and this Final EIS/EIR.

Response to Comment R-BU7-8

Please refer to Response to Comment R-BU7-4 and R-BU7-5, above.

Response to Comment R-BU7-9

The project's purpose is clearly described in Chapter 1 (closing an approximately two mile gap in the LRT system). Project alternatives consisting of different alignments and approaches to meeting the project purpose are clearly expressed in Chapter 2, Alternatives Considered. Evaluation of a range of alternatives is required under NEPA (40 CFR 1502.14), as well as FTA NEPA implementing regulations (23 CFR 771.105(b), 771.123(c) and 771.125(a)). The description of alternatives is provided in Section 2.3 of the Draft EIS/EIR, Supplemental EA/Recirculated Draft EIR Sections, and this Final EIS/EIR. The public has repeatedly complimented Metro on the clarity and thoroughness of the environmental review process (see comments on the Draft EIS/EIR from diverse community members in Volumes F-2 and F-3 of this Final EIS/EIR). In addition, Metro has been working closely with communities in the project area since the outset of the Alternatives Analysis process in October 2007. Metro staff have performed extensive outreach measures, as documented in Chapter 7, Public and Agency Outreach, of the Draft EIS/EIR and this Final EIS/EIR, including numerous public meetings,

Japanese and Korean language interpretations, and door-to-door visits with business owners to provide information about the project and gather input. Advertisements regarding scoping meetings and community updates were printed in local newspapers, including Japanese language publications.

Response to Comment R-BU7-10

The Supplemental EA/Recirculated Draft EIR Sections identified an environmentally superior alternative in Chapter 2, Section 2.6.3, page 2-49. This Final EIS/EIR also identifies the Locally Preferred Alternative as the environmentally superior alternative in Section 2.6.3.

Response to Comment R-BU7-11

Please refer to Response to Comment R-BU7-10, above. Pursuant to NEPA (23 CFR 771.130 (c), Section 21029.1 of the Public Resources Code, and CEQA Guidelines Section 15088.5, only sections containing significant new information were recirculated as part of the Supplemental EA/Recirculated Draft EIR Sections. Sections that did not contain significant new information were not recirculated. Significant new information was not contained in the Executive Summary or Chapter 6, Cost and Performance Considerations and Summary Comparison of Alternatives, which provide a summary comparison of alternatives. Impacts of the alternatives were compared in the Draft EIS/EIR and this Final EIS/EIR in the Executive Summary, in each environmental discipline section in Chapters 3 and 4, and Chapter 6, Cost and Performance Considerations and Summary Comparison of Alternatives. Tables, which summarize each alternative's impact to each environmental discipline, are also provided throughout Chapters 3 and 4 of the Draft EIS/EIR and this Final EIS/EIR to allow the reader to visually compare impacts associated with each alternative.

The environmentally superior alternative, which is the Locally Preferred Alternative, was discussed in Section 2.6.3 of the Supplemental EA/Recirculated Draft EIR Sections and this Final EIS/EIR. A summary comparison of alternatives is provided in Table ES-1 and Section 6.6 of Chapter 6, Cost and Performance Considerations and Summary Comparison of Alternatives, in the Draft EIS/EIR and this Final EIS/EIR. Based on the results of the technical analysis of all the alternatives as reported in this Final EIS/EIR, the Locally Preferred Alternative, as refined, is the environmentally superior alternative.

Response to Comment R-BU7-12

The Draft and Final EIS/EIR included a full and complete analysis and disclosure of all project impacts. All impacts, including cumulative impacts that can reasonably be foreseen and predicted, were analyzed and disclosed for each environmental discipline in Chapters 3 and 4. The cumulative impact analysis took into account past, present, and probable future projects within the project area that are expected to be under construction or in operation during the same time frames as the proposed project. The past, present, and probable future projects that were considered are listed in Section 4.19, Cumulative Impacts, of the Draft EIS/EIR and this Final EIS/EIR. Cumulative impacts and related mitigation measures for each of the resource areas that would occur with implementation of the alternatives are described in Chapters 3 and 4 of the Draft EIS/EIR and this Final EIS/EIR. A summary of the significant and unavoidable cumulative adverse effects/impacts for each alternative, as discussed in Chapters 3 and 4, is provided in Section 4.19, Cumulative Impacts, of the Draft EIS/EIR and this Final EIS/EIR.

Major rail capital investments can support possible future development. This is one reason to make such capital investments. However such development cannot occur without appropriate zoning and land use regulations, and a supportive real estate market including financing. There is no way to predict or guarantee that such developments will occur. If they do occur, they will be subject to environmental and planning review regardless and independent of the proposed rail investment. It would be unreasonable and unfounded to speculate as to the nature and potential impacts of surrounding development that could occur with or without the proposed Regional Connector Project. All property acquired as a partial take or full take would be for permanent transit use, such as station plazas, entrances, and portals. No surplus property would be left after construction. The Regional Connector project has independent utility, and the scope of the Locally Preferred Alternative is not affected by potential future redevelopment. The project has been properly analyzed in this EIS/EIR.

Response to Comment R-BU7-13

As has been proven in the case of numerous cities, including Los Angeles, investment in a rail project in no way guarantees or induces any form of development. The rail investment can support development that might otherwise occur; however, such development requires separate private investment, planning and zoning support that are unrelated to the Regional Connector project. Therefore, it would be highly speculative and inaccurate to assume and analyze any specific external projects in this EIS/EIR beyond citing that the Regional Connector could support rather than hinder appropriate development. The Regional Connector project has independent utility, and the scope of the Locally Preferred Alternative is not affected by potential future redevelopment.

Response to Comment R-BU7-14

Metro has absolutely no basis to conclude or assume that property not needed after construction will revert to anything other than existing parking or commercial uses for which it is designated and zoned. Assuming any other development would be completely speculative. Ultimate development would occur or not occur regardless of the Regional Connector project. Therefore, there is no analysis appropriate to include that has not already been presented in the EIS/EIR.

Response to Comment R-BU7-15

FTA criteria used to determine noise and vibration impacts are not based on the duration of construction. The criteria are based on the level of noise and vibration that would be generated during construction and the type of land use that would be affected. The discussion of construction-related noise impacts has been clarified in Section 4.7, Noise and Vibration, of this Final EIS/EIR. As indicated in Section 4.7 and Table 4.7-15 of this Final EIS/EIR, estimated construction noise levels would not exceed FTA construction noise criteria and impacts would not be adverse under NEPA and would be less than significant under CEQA. Consistency with the goals of the applicable local ordinances and implementation of best management practices (BMPs) is to ensure that noise levels associated with construction of the Locally Preferred Alternative would not result in an adverse effect under NEPA or a significant impact under CEQA to sensitive land uses as classified by the FTA. Section 4.7, Noise and Vibration, of the Draft EIS/EIR, Supplemental EA/Recirculated Draft EIR Sections, and this Final EIS/EIR determined that sensitive or historic buildings within 21 feet of construction activities (involving large

bulldozers and drill rigs) for all the LRT alternatives may be susceptible to vibration damage and impacts would be significant/adverse prior to implementation of mitigation. Mitigation measures were identified in Section 4.7, Noise and Vibration, of the Draft EIS/EIR and the Supplemental EA/Recirculated Draft EIR Sections to reduce impacts associated with potential vibration damage to not adverse. Since publication of the Supplemental EA/Recirculated Draft EIR Sections, mitigation measures have been refined and the discussion of the potential for construction-activity-induced vibration to damage buildings has been clarified. Please refer to Section 4.7, Noise and Vibration, of this Final EIS/EIR.

The analysis of the potential for construction-activity-induced vibration to damage the structure of buildings used FTA's minimum safe distances identified for Category IV buildings of 0.12 inch/sec peak particle velocity (PPV) in Table 4.7-5. Given that equipment such as large bulldozers and drill rigs would be the main source of construction vibration that could have the potential to cause vibration damage, sensitive buildings (Category I, II, III, IV buildings as defined in Table 4.7-4 of the Supplemental EA/Recirculated Draft EIR Sections and this Final EIS/EIR) or historic buildings within 21 feet of construction may be susceptible to vibration damage and impacts would be adverse/significant. As part of mitigation for the Locally Preferred Alternative, a pre-construction survey of all structures within 21 feet of the anticipated vibration-producing construction activity would be conducted to verify the building category, structural condition, and to provide a baseline for monitoring of ground-borne vibration and the potential for ground-borne vibration to cause damage. During construction, use of building protection measures such as underpinning, soil grouting, or other forms of ground improvement, use of lower vibration equipment and/or construction techniques, combined with a geotechnical and vibration monitoring program would be used to protect identified historic and sensitive structures. With implementation of mitigation measures identified in Section 4.7.4.2.1, construction-related vibration impacts to historic and sensitive buildings located within 21 feet of the anticipated vibration-producing construction activity would not be adverse. Refer to Section 4.7, Noise and Vibration, of this Final EIS/EIR for a more detailed discussion of vibration impacts associated with the Regional Connector project.

Response to Comment R-BU7-16

Please refer to Response to Comment R-BU7-15, above. FTA guidelines suggest minimum safe distances between construction equipment and buildings based on the types of construction equipment and the category of a building (physical structure of the building). Buildings are categorized with regard to susceptibility to vibration damage, with Category I buildings being the least susceptible and Category IV buildings being the most susceptible. The Wilson, Ihrig, and Associates March 15, 2011 Memorandum determined the minimum safe distance based on the category of each building in the vicinity of cut and cover construction in Little Tokyo. Regardless of the distance used in the Wilson, Ihrig, and Associates March 15, 2011 Memorandum, the analysis in Section 4.7, Noise and Vibration, of the Supplemental EA/Recirculated Draft EIR Sections and this Final EIS/EIR is a more conservative analysis as it used the most sensitive building category (Category IV) to determine the minimum safe distance between construction equipment and buildings and the impact findings identified in Section 4.7, Noise and Vibration, are correct. Section 4.7, Noise and Vibration, of the Supplemental EA/Recirculated Draft EIR Sections and this Final EIS/EIR determined that any sensitive building (Category I, II, III, IV buildings as defined in Table 4.7-4 of the EIS/EIR) or historic building within 21 feet of

construction may be susceptible to vibration damage, which would include the Japanese Village Plaza parking structure. With implementation of mitigation identified in Section 4.7.4.2.1 of this Final EIS/EIR, construction-related vibration impacts to historic and sensitive buildings located within 21 feet of the anticipated vibration-producing construction activity would not be adverse.

Response to Comment R-BU7-17

Please refer to Responses to Comments R-BU7-15 and R-BU7-16, above. Mitigation measures were identified in Section 4.7.5 of the Supplemental EA/Recirculated Draft EIR Sections, which would reduce construction-related vibration impacts to historic and sensitive buildings located within 21 feet of the anticipated vibration-producing construction activity to not adverse. Since publication of the Supplemental EA/Recirculated Draft EIR Sections, specificity has been added to these mitigation measures for the Locally Preferred Alternative, which are identified in Section 4.7.4.2 of this Final EIS/EIR.

Response to Comment R-BU7-18

Metro does not anticipate subsidence that could cause adverse effects under NEPA or significant impacts under CEQA. The potential for subsidence was identified in Sections 4.9.3.4 and 4.9.3.5 of the Draft EIS/EIR and this Final EIS/EIR. Mitigation measures to avoid subsidence were identified in Section 4.9.4.1 of the Draft EIS/EIR. These mitigation measures have been incorporated into Section 4.9.4.2 and the Mitigation Monitoring and Reporting Program for the Locally Preferred Alternative (Chapter 8) of this Final EIS/EIR. The potential subsidence has not changed due to refinements made to the Locally Preferred Alternative since publication of the Draft EIS/EIR. The 300 block of East 2nd Street is identified in Figure 4.9-3 as a property of concern due to potential for soil contamination due to prior land uses, not subsidence risk, as indicated in Table 4-5 of Appendix U, Geotechnical/Subsurface/Seismic/ Hazardous Materials Technical Memorandum, of the Draft EIS/EIR and this Final EIS/EIR. Mitigation measure to address contaminated soil, if encountered during excavation, are also included in Section 4.9.4.1 of the Draft EIS/EIR and Section 4.9.4.2 and the Mitigation Monitoring and Reporting Program for the Locally Preferred Alternative (Chapter 8) of this Final EIS/EIR. No unusual potential for subsidence beyond what is described in Sections 4.9.3.5 and 4.9.3.5 of the Draft EIS/EIR was found to exist on this property. Section 4.9 of the Draft EIS/EIR and this Final EIS/EIR adequately discloses all potential adverse effects/significant impacts related to geotechnical, subsurface, seismic hazards, and hazardous materials.

The sentences immediately following the quoted text from Appendix U, Geotechnical/Subsurface/ Seismic/Hazardous Materials Technical Memorandum, of the Draft EIS/EIR and this Final EIS/EIR discuss mitigation measures that would reduce the potential impacts to not adverse under NEPA and to a less than significant level under CEQA. These mitigation measures have been refined and confirmed in Section 4.9.4.2 and the Mitigation Monitoring and Reporting Program for the Locally Preferred Alternative (Chapter 8) of this Final EIS/EIR.

Response to Comment R-BU7-19

The refined Locally Preferred Alternative alignment would actually have the same or fewer impacts on traffic, parking, and transportation compared to the Fully Underground LRT Alternative alignment identified in the Draft EIS/EIR. The purpose of the refinements described

in the Supplemental EA/Recirculated Draft EIR Sections was to reduce impacts as is clearly stated. Therefore, all potentially adverse effects/significant impacts were properly and completely analyzed and disclosed in the Draft EIS/EIR and the Supplemental EA/Recirculated Draft EIR Sections.

Response to Comment R-BU7-20

The Regional Connector would provide new non-automobile access to the area, and partially offset the parking demand in the area. If people can access the area via the Regional Connector, they would be less likely to use automobiles to access the area. As indicated in Chapter 6, Cost and Performance Considerations and Summary Comparison of Alternatives, of this Final EIS/EIR, the Locally Preferred Alternative is expected to generate 17,700 new daily system-wide linked trips, which was estimated through the Metro travel forecasting model. The new non-automobile access to the area would not be available until the project is complete. Therefore, mitigation such as the provision of 200 self-parking spaces on the Mangrove property, which would be capable of holding 300 cars if supplemental parking services (such as valet) are implemented; development of an advanced parking reservation system; and coordination with the Los Angeles Department of Transportation (LADOT) to open city parking lots for short-term use on evenings and weekends during construction in the vicinity of Little Tokyo shall be implemented to offset the parking spaces lost during construction of the Locally Preferred Alternative. The discussion of off-street parking impacts in Section 4.2, Displacements and Relocation, has been clarified since publication of the Supplemental EA/Recirculated Draft EIR Sections. As indicated in Section 4.2, Displacements and Relocation, of this Final EIS/EIR, the Locally Preferred Alternative would not result in a considerable contribution to a cumulative impact with implementation of mitigation measures.

Response to Comment R-BU7-21

The Draft EIS/EIR, Supplemental EA/Recirculated Draft EIR Sections, and this Final EIS/EIR do specifically analyze and quantify impacts on parking. Specific mitigation measures are proposed for the parking impacts associated with construction in Sections 3.4 and 4.2.4 of the Draft EIS/EIR and Section 4.2.5 of the Supplemental EA/Recirculated Draft EIR Sections. Final mitigation measures for parking impacts associated with the Locally Preferred Alternative are provided in Sections 3.4.2 and 4.2.4.2 of this Final EIS/EIR. Operation-related parking impacts are not adverse/significant. This is clearly supported by the analysis in Chapters 3 and 4. Conclusions are provided in Sections 3.3.5.1.3, 3.3.5.2.3, and 4.2.3.5 of the Draft EIS/EIR and this Final EIS/EIR.

Response to Comment R-BU7-22

The acquisition of underground easements would have no adverse land use impacts because the underground easements would not change existing land uses. Please refer to Response to Comment R-BU7-2, above. Metro would provide compensation for easements in compliance with the Uniform Relocation Assistance and Real Property Acquisition Policies Act of 1970 (Uniform Act) as indicated in mitigation measure number DR-8 in the Mitigation Monitoring and Reporting Program for the Locally Preferred Alternative (Chapter 8 of this Final EIS/EIR). Please refer to Section 4.2.3.5 of this Final EIS/EIR for analysis of displacement and relocation consequences associated with the Locally Preferred Alternative, including underground

easements. Issues related to the value of the easements to private property owners will be addressed and resolved through Metro's easement acquisition process.

Response to Comment R-BU7-23

There is no deferral of impacts analysis or mitigation identification. This Final EIS/EIR identifies and commits to specific mitigation measures for parking loss where appropriate (refer to Chapter 8, Mitigation Monitoring and Reporting Program for the Locally Preferred Alternative).

Response to Comment R-BU7-24

On-street parking impacts were analyzed in Chapter 3, Transportation Impacts and Mitigation, with on-street parking impacts associated with the Locally Preferred Alternative analyzed in Sections 3.3.5.1.3 and 3.3.5.2.3 of the Draft EIS/EIR and this Final EIS/EIR. Off-street parking impacts, which included potential impacts to parking lots, were analyzed in Section 4.2, Displacements and Relocation, in the Draft EIS/EIR, Supplemental EA/Recirculated Draft EIR Sections, and this Final EIS/EIR with off-street parking impacts associated with the Locally Preferred Alternative analyzed in Section 4.2.3.5 of the Supplemental EA/Recirculated Draft EIR Sections and this Final EIS/EIR. Sections 3.4.2 and 4.2.4.2 and the Mitigation Monitoring and Reporting Program for the Locally Preferred Alternative (Chapter 8) of this Final EIS/EIR contain specific committed mitigation measures for on- and off-street parking impacts.

Response to Comment R-BU7-25

The current wording of the mitigation measure has the same meaning as the proposed wording, "Metro shall maintain access...." The proposed language does not differ substantially from the language provided. Therefore, there has been no change in the mitigation measure's wording or intent.

Response to Comment R-BU7-26

This mitigation measure referenced in the comment letter from Section 4.7, Noise and Vibration, of the Supplemental EA/Recirculated Draft EIR Sections, was identified (along with the other mitigation measures in the section) to address construction-related vibration impacts to historic and sensitive buildings located within 21 feet of the anticipated vibration-producing construction activity, not geotechnical risks. The second mitigation measure referenced in the comment letter has been refined since publication of the Draft EIS/EIR and more information regarding threshold values has now been provided. Please refer to Section 4.9.4.2, mitigation measure number GT-1, of this Final EIS/EIR.

Response to Comment R-BU7-27

Section 4.7.5 of the Supplemental EA/Recirculated Draft EIR Sections identified general construction mitigation measures and stated that the general construction mitigation measures, in combination with the mitigation measure involving advance notification and coordination to affected property owners regarding schedules for tunneling and other activities prior to the commencement of those activities, would mitigate adverse ground-borne vibration and ground-borne noise impacts to the Japanese Village Plaza and the other specified land uses. The general construction mitigation measures are identified in Section 4.7.4.2 and Chapter 8 of this Final EIS/EIR as NV-3 through NV-12.

Please refer to Responses to Comments R-BU7-15 and R-BU7-17, above, regarding analysis of the potential for construction-activity-induced vibration to damage the structure of buildings and mitigation to reduce potential impacts.

Response to Comment R-BU7-28

Assuming that the comment is referring to mitigation identified to reduce ground-borne noise impacts associated with operation of the Locally Preferred Alternative, mitigation identified in Section 4.7.5 of the Supplemental EA/Recirculated Draft EIR Sections stated that Metro shall conduct engineering studies during preliminary engineering to verify initial estimates of ground-borne noise and shall implement high compliance resilient fasteners or other appropriate measures as needed to eliminate impacts and reduce ground-borne noise below FTA annoyance criteria. FTA thresholds, used for determining ground-borne vibration and ground-borne noise impacts, are based on land use type. Given that the Japanese Village Plaza and Walt Disney Concert Hall are two different types of land uses, FTA criteria used for determining ground-borne vibration and ground-borne noise impacts to the Walt Disney Concert Hall was more stringent than the criteria used for the Japanese Village Plaza because the Walt Disney Concert Hall is a more sensitive land use. Therefore, the mitigation measures for the Walt Disney Concert Hall were not necessary to reduce ground-borne noise impacts below FTA criteria used for the Japanese Village Plaza. Implementation of high compliance resilient fasteners or other appropriate measures was included in the Supplemental EA/Recirculated Draft EIR Sections as part of the mitigation measure to reduce ground-borne noise impacts associated with operation of the Locally Preferred Alternative to the Japanese Village Plaza. No further mitigation is required. Refer to Section 4.7, Noise and Vibration, of this Final EIS/EIR for a more detailed analysis of ground-borne noise impacts. Since publication of the Supplemental EA/Recirculated Draft EIR Sections, specificity has been added to the mitigation measures for the Locally Preferred Alternative which are identified in Section 4.7.4.2 of this Final EIS/EIR.

Response to Comment R-BU7-29

Metro and FTA find that both monitoring and mitigation for methane are adequate and appropriate mitigation measures. Measures to limit ground movement are location-specific, and rely partly on building surveys which must be performed immediately before the start of construction in order to document a true baseline condition of the buildings. The mitigation measure has been expanded in Section 4.9.4.2 of this Final EIS/EIR and incorporated into the Mitigation Monitoring and Reporting Program for the Locally Preferred Alternative (Chapter 8 of this Final EIS/EIR) as mitigation measure number GT-1. The expanded mitigation measure cites quantitative thresholds that will be used as performance criteria, in addition to the qualitative performance standard already established in the Draft EIS/EIR. Settlement and methane mitigation measures from Appendix U, Geotechnical/Subsurface/ Seismic/Hazardous Materials Technical Memorandum, of the Draft EIS/EIR have also been expanded with additional specificity and standards in Section 4.9.4.2 and the Mitigation Monitoring and Reporting Program for the Locally Preferred Alternative (Chapter 8) of this Final EIS/EIR.

Response to Comment R-BU7-30

Please refer to Responses to Comments R-BU7-1 through R-BU7-29, above for responses to specific comments raised in this letter on the Draft EIS/EIR and Supplemental EA/Recirculated Draft EIR Sections. Subsequent to publication of the Draft EIS/EIR, the Locally Preferred

Alternative alignment was modified to reduce impacts. The relevant and appropriate sections of the Draft EIS/EIR were re-circulated in the Supplemental EA/Recirculated Draft EIR Sections to share the refined alignment with the public and to disclose any potential new or different impacts. The commenter and others had ample opportunity to comment on the Supplemental EA/Recirculated Draft EIR Sections during the 45-day review period. Since publication of the Supplemental EA/Recirculated Draft EIR Sections, significant new information, which would initiate recirculation per CEQA Guidelines §15088.5(a) and NEPA (23 CFR 771.130 (c)), has not been added to the EIS/EIR. Following circulation of the Draft EIS/EIR and Supplemental EA/Recirculated Draft EIR Sections, and consideration of all comments received, Metro and FTA have prepared this Final EIS/EIR. This report includes and addresses all of the comments received during the Draft EIS/EIR and Supplemental EA/Recirculated Draft EIR Sections public comment periods.

Response to Comment R-BU7-31

Comments in this comment letter are addressed individually in the responses below. Potential impacts to the Japanese Village Plaza site are adequately evaluated in the Draft EIS/EIR and the Supplemental EA/Recirculated Draft EIR Sections as indicated in the following responses.

Response to Comment R-BU7-32

Metro is aware of the buildings at the Japanese Village Plaza site. Impacts and mitigation pertaining to the proposed alignment beneath Japanese Village Plaza are discussed in the sections of Chapter 4 in the Supplemental EA/Recirculated Draft EIR Sections and this Final EIS/EIR. Approximate measurements are noted. Plans and profile drawings are provided to scale in Appendix R-1, Locally Preferred Alternative Drawings, of the Supplemental EA/Recirculated Draft EIR Sections and Appendix 1, Locally Preferred Alternative Drawings, of this Final EIS/EIR.

Response to Comment R-BU7-33

Metro would acquire a subsurface easement beneath the parking garage, as indicated in Table 4.2-5 and Appendix R-1, Locally Preferred Alternative Drawings, of the Supplemental EA/Recirculated Draft EIR Sections and Table 4.2-5 and Appendix 1, Locally Preferred Alternative Drawings, of this Final EIS/EIR. The acquired area would be permanently limited to use for light rail transit tunnels. Metro would provide compensation for the easement in compliance with the Uniform Act as indicated in mitigation measure number DR-8 in the Mitigation Monitoring and Reporting Program for the Locally Preferred Alternative (Chapter 8 of this Final EIS/EIR). This mitigation measure was also included in Section 4.2.4 of the Supplemental EA/Recirculated Draft EIR Sections. Metro would not acquire any other Japanese Village Plaza property outside of the acquisitions identified in Table 4.2-5 and Appendix R-1, Locally Preferred Alternative Drawings, of the Supplemental EA/Recirculated Draft EIR Sections and Table 4.2-5 and Appendix 1, Locally Preferred Alternative Drawings, of this Final EIS/EIR. Areas not acquired would remain available to the Japanese Village Plaza for subterranean use.

Response to Comment R-BU7-34

The tunnel alignment is not located within a state-designated surface fault rupture zone and no known active fault capable of causing surface rupture crosses the proposed tunnel alignment. The preliminary engineering team's expert studied fault rapture zones and no faults along the

Locally Preferred Alternative alignment were identified. The commenter indicates that "a zone of potential vertical deformation" exists north of Station 85+00; however, the mechanism for vertical deformation is not identified in the comment letter. It is not clear how GeoDesign came to the statement about the source of potential vertical deformation discussed in the comment letter. Metro's design team looks forward to ongoing coordination and communication with property owners during the final design process.

Response to Comment R-BU7-35

Maximum potential settlements have been evaluated based on our knowledge of the building/structure foundations in the Japanese Village Plaza and actual ground loss due to tunneling operations. Measures to mitigate potential foundation movements include real-time Multipoint Borehole Extensometer (MPBX) monitoring, specific building/structure monitoring, compensation grouting, and the use of a closed-face pressurized tunnel boring machines. As tunnel excavation advances, real time MPBX data (ahead of the excavation) will provide ground movement at depth. Tunnel boring machine operations will be continually monitored and adjusted to maintain acceptable settlement levels. In addition, preparation for compensation grouting has been included in the measures to mitigate potential settlement.

Response to Comment R-BU7-36

Portions of the proposed alignment are located within a Methane Buffer Zone delineated by the City of Los Angeles, and a "Gassy" condition will be utilized as an assumption for the tunnel design. Mitigation measures will be implemented accordingly in the final tunnel design, which mitigate the risk of exposure to methane and other harmful gasses. Gas monitoring wells have been installed along the Locally Preferred Alternative alignment as a part of the investigation program to collect additional information. Methane mitigation measures from Appendix U, Geotechnical/Subsurface/ Seismic/Hazardous Materials Technical Memorandum, of the Draft EIS/EIR have also been expanded with additional specificity and standards in Section 4.9.4.2 and the Mitigation Monitoring and Reporting Program for the Locally Preferred Alternative (Chapter 8) of this Final EIS/EIR.

Response to Comment R-BU7-37

Sections 4.10.3.4 and 4.10.3.5 of the Draft EIS/EIR indicate that dewatering will be needed where groundwater is encountered, and that groundwater would likely be encountered during excavation activities. This would include the excavation activities proposed beneath the Japanese Village Plaza. Dewatering methods are identified in Sections 4.10.3.4 and 4.10.3.5 of the Draft EIS/EIR, and mitigation measures to ensure adverse effects under NEPA and significant impacts under CEQA related to dewatering do not occur are identified in Sections 4.10.4 of the Draft EIS/EIR. These mitigation measures have been incorporated into Section 4.10.4.2 and the Mitigation Monitoring and Reporting Program for the Locally Preferred Alternative (Chapter 8) of this Final EIS/EIR.

Response to Comment R-BU7-38

All known underground obstructions, including known utilities, will be identified on the drawings for the Design/Build Contractor. The location and size of the known obstructions will be coordinated with the tunnel design and construction staging. Potential impacts to the known foundations and utilities due to the tunneling operation will be evaluated pre-construction.

Where required, known obstructions may be removed; known building or structure foundations are protected; and known utilities may be protected, or temporarily or permanently relocated. Instrumentation and monitoring of all known impacted foundation/building and major utility movements will be monitored during the tunneling construction. Refer to Section 4.19, Construction Impacts, of this Final EIS/EIR for further information.

Response to Comment R-BU7-39

Please refer to Responses to Comments R-BU7-15 and R-BU7-16, above. The analysis of the potential for construction-related vibration to damage the structure of buildings used a minimum safe distances of 21 feet. The methodology used to determine the safe distance is discussed in Section 4.7, Noise and Vibration, of the Supplemental EA/Recirculated Draft EIR Sections and this Final EIS/EIR.

Operation of a tunnel boring machine could generate up to 0.055 inches per second PPV at a distance of 33 feet. Since the Japanese Village Plaza parking garage is a reinforced concrete structure (Category I, 0.5 in/sec PPV), operation of the tunnel boring machine would potentially exceed the Category I FTA criterion at a distance of six feet from a building. Since the Japanese Village Plaza parking structure is located beyond this distance, vibration damage from tunnel boring machine operations would not occur and mitigation measures would not be required for tunnel boring machine operation as indicated in Section 4.7, Noise and Vibration, of the Supplemental EA/Recirculated Draft EIR Sections and this Final EIS/EIR.

As indicated in Section 4.7, Noise and Vibration, of the Supplemental EA/Recirculated Draft EIR Sections and this Final EIS/EIR, construction of the project would not involve impact or sonic pile driving (pre-auguring would be used for installation of the soldier piles instead) or large vibratory rollers. Therefore, equipment such as large bulldozers and drill rigs would be the main source of construction vibration that could have the potential to cause vibration damage. Based on the FTA's minimum safe distances identified for Category IV buildings of 0.12 inch/sec PPV in Table 4.7-5, the minimum safe distance between construction activities (involving large bulldozers and drill rigs) and buildings would be 21 feet. Therefore, construction-related vibration impacts to sensitive buildings (Category I, II, III, IV buildings as defined in Table 4.7-4 of the Supplemental EA/Recirculated Draft EIR Sections and this Final EIS/EIR) and historic buildings located within 21 feet of the anticipated vibration-producing construction activity, which includes the Category I Japanese Village Plaza parking structure, would be adverse/significant. Mitigation measures to reduce this impact to not adverse, such as geotechnical and vibration monitoring, and pre-post-construction survey, were identified in the Supplemental EA/Recirculated Draft EIR Sections and are included in Section 4.7.4.2 and Chapter 8 of this Final EIS/EIR.

Vibration generated during LRT operation would be far less than vibration generated during construction. The Category I criterion of 0.5 inches per second PPV for construction vibration is approximately 102 VdB. As outlined in the July 13, 2011 memorandum, the expected maximum ground-borne vibration level at Hikari Lofts is 72VdB without vibration control measures. The operational vibration at the Japanese Village Plaza parking structure is expected to be of a similar magnitude and no building damage effects are expected.

Response to Comment R-BU7-40

Please refer to Response to Comment R-BU7-35, above. A significant engineering effort is devoted to ensure proper protection of buildings, utilities and safety of personnel within the Japanese Village Plaza during construction activities. As indicated in Section 4.9.4.2, as part of mitigation, ground improvement such as grouting or other methods shall be required to fill voids where appropriate and offset potential settlement when excess material has been removed during excavation. A special report entitled "Building and Adjacent Structure Protection Report" is being developed to address the construction impacts disclosed in the EIS/EIR and to apply the specific mitigation measures identified in the Mitigation Monitoring and Reporting Program for the Locally Preferred Alternative (Chapter 8) of this Final EIS/EIR to protect buildings during construction. The report will be completed during final design, prior to construction. The report, once completed, will be available through Metro's Records Management Center by request.

Response to Comment R-BU7-41

The selected Design/Build Contractor will request entry to specific Japanese Village Plaza site facilities to implement the "Instrumentation and Monitoring Program". The program will be developed to ensure "real-time" monitoring is being evaluated during the tunneling operation to mitigate any potential impacts.

Response to Comment R-BU7-42

The Japanese Village Plaza parking structure will be protected from impacts due to the cut and cover construction of the station and the tunnel boring machine(s) which crown approximately 15 feet below the foundation structure. The depth of the foundation structure was confirmed by the excavation of a small test pit in the public right-of-way adjacent to the parking structure. Specific details from the test pit will be provided to assist the Design/Build Contractor to develop the final design to monitor and protect the structure during tunneling and open cut activities. Coordination and communication with the property owner will be ongoing throughout the design and construction process.

Response to Comment R-BU7-43

The Design/Build Contractor has several choices of support of excavation consistent with the allowable adjacent ground movements generated due to the excavation and will be responsible for the final design. The preliminary engineering drawings provide a suggested method of support of excavation that will meet the expected allowable ground movement. Tie-backs are suggested in specific areas of public property; however, no temporary easements have been anticipated to allow the use of tie-backs in other areas. Typically, for the deep main station box shoring system cross-bracing is proposed to minimize ground movement.

Response to Comment R-BU7-44

Please refer to Response to Comment R-BU7-1, above.

Response to Comment R-BU7-45

Please see responses above.

Response to Comment R-BU7-46

The alignment of the Locally Preferred Alternative traveling beneath the Japanese Village Plaza was described in Chapter 2, Alternatives Considered and analyzed in Chapters 3 and 4 of the Supplemental EA/Recirculated Draft EIR Sections and this Final EIS/EIR.

Response to Comment R-BU7-47

Please refer to Response to Comment R-BU7-6, above.

Response to Comment R-BU7-48

These are clearly indicated in Figures 2-1 through 2-3 and 2-8 through 2-10 in Chapter 2, Alternatives Considered, of the Supplemental EA/Recirculated Draft EIR Sections and this Final EIS/EIR and Appendix 1, Locally Preferred Alternative Drawings, of this Final EIS/EIR.

Response to Comment R-BU7-49

Chapter 2, Alternatives Considered, of the EIS/EIR contains both general regional maps showing the context of the Regional Connector project, and specific maps showing the project location including the alignment. Refer to Figures 2-1 through 2-3, 2-8 through 2-10, 2-37, and Appendix 1, Locally Preferred Alternative Drawings, of this Final EIS/EIR.

Response to Comment R-BU7-50

The EIS/EIR properly shows all alternatives on a map consistent with CEQA and NEPA.

Response to Comment R-BU7-51

The purpose of the technical appendices is not to designate a preferred alternative but to thoroughly analyze the EIS/EIR alternatives in similar detail so that impacts may be compared as required by CEQA and NEPA.

Response to Comment R-BU7-52

The EIS/EIR does compare the alternatives, including the Locally Preferred Alternative, throughout the analysis. The comparison is summarized in the Executive Summary and in Chapter 6, Cost and Performance Considerations and Summary Comparison of Alternatives.

Response to Comment R-BU7-53

The Draft EIS/EIR and this Final EIS/EIR contain a thorough and precise description of the project, the Locally Preferred Alternative, using both text and graphics. Refer to Section 2.3.6, Figures 2-1 2-10, and Appendix 1, Locally Preferred Alternative Drawings, of this Final EIS/EIR for a description of the Locally Preferred Alternative. The Locally Preferred Alternative designated by the board is the Fully Underground LRT Alternative; this is clearly stated in the beginning of Chapter 2, Alternatives Considered, of the Supplemental EA/Recirculated Draft EIR Sections and this Final EIS/EIR.

Response to Comment R-BU7-54

The Supplemental EA/Recirculated Draft EIR Sections does analyze and disclose the impacts of the refined Locally Preferred Alternative on all relevant properties including the Japanese Village Plaza. For example, potential for noise and vibration impacts to the Japanese Village Plaza were

analyzed in Section 4.7, Noise and Vibration, of the Supplemental EA/Recirculated Draft EIR Sections and this Final EIS/EIR.

Response to Comment R-BU7-55

The refined Locally Preferred Alternative described in the Supplemental EA/Recirculated Draft EIR Sections would reduce the impacts of displacements and relocations as is indicated in Section 4.2, Displacement and Relocation, of the Supplemental EA/Recirculated Draft EIR Sections. This analysis is also contained in Section 4.2, Displacement and Relocation, of this Final EIS/EIR.

Response to Comment R-BU7-56

Section 4.7, Noise and Vibration, of the Supplemental EA/Recirculated Draft EIR Sections includes supplementary noise analysis at relevant locations. This analysis is also included in Section 4.7, Noise and Vibration, of this Final EIS/EIR.

Response to Comment R-BU7-57

Please refer to Response to Comment R-BU7-18, above.

Response to Comment R-BU7-58

Please refer to Response to Comment R-BU7-18, above.

Response to Comment R-BU7-59

Relevant differences in construction impacts are analyzed and disclosed in Chapters 3 and 4, and summarized in Section 4.18, Construction Impacts, of the Supplemental EA/Recirculated Draft EIR Sections and this Final EIS/EIR. The refinements to the Locally Preferred Alternative analyzed and disclosed in the Supplemental EA/Recirculated Draft EIR Sections result in reduced construction impacts.

Response to Comment R-BU7-60

Section 4.12.1, Built Environment, of the Supplemental EA/Recirculated Draft EIR Sections includes additional analysis of historic resources affected by the refinements to the Locally Preferred Alternative. This analysis is also included in Section 4.12.1, Built Environment, of this Final EIS/EIR.

Response to Comment R-BU7-61

Please refer to Response to Comment R-BU7-10, above.

Response to Comment R-BU7-62

Chapter 10, Comparison of Project Against Existing Conditions, of the Supplemental EA/Recirculated Draft EIR Sections and this Final EIS/EIR analyzes environmental impacts using a year 2010 baseline per the *Sunnyvale West Neighborhood Assn, et al v. City of Sunnyvale City Council* court ruling. A modified baseline was prepared for this analysis, using only the portions of the rail system that were open in 2010. Analysis in the chapter revealed that transportation and cumulative impacts would be less in the year 2010 scenario than in 2035, and all other impacts would be similar or identical. The mitigation measures identified to address CEQA

impacts in Chapters 3, 4, and 8 of the EIS/EIR would be sufficient for the year 2010 impacts to achieve the same CEQA determinations as year 2035. No unique impacts would occur under the year 2010 scenario, and no additional mitigation measures would be required.

Response to Comment R-BU7-63

Please refer to Response to Comment R-BU7-62, above.

Response to Comment R-BU7-64

Please refer to Responses to Comments R-BU7-23 through R-BU7-25, above.

There is no deferred analysis of impacts. The analysis and research indicate that there would be no adverse effect under NEPA and no significant impact under CEQA from electromagnetic fields (EMFs) as is clearly stated (with references). Monitoring was offered at sensitive locations to ensure that no unanticipated impacts have occurred and to reassure concerned citizens of Metro's sensitivity to their concerns. Nonetheless, since publication of the Draft EIS/EIR, Section 4.9, Geotechnical/Subsurface/Seismic/Hazardous Materials has been updated. The mitigation measure for monitoring EMFs is no longer needed for the Locally Preferred Alternative based on the updated hazardous materials analysis for the Locally Preferred Alternative. Refer to Section 4.9.3.5.2 of this Final EIS/EIR for more information.

Response to Comment R-BU7-65

Mitigation is not deferred. The Mitigation Monitoring and Reporting Program for the Locally Preferred Alternative, Chapter 8, and Section 4.17.4.3 of this Final EIS/EIR, includes specific mitigation measures to address this impact such as; the provision of 200 self-parking spaces on the Mangrove property, which would be capable of holding 300 cars if supplemental parking services (such as valet) are implemented; development of an advanced parking reservation system; and coordination with LADOT to open city parking lots for short-term use on evenings and weekends during construction in the vicinity of Little Tokyo. The parking study is simply proposed to establish a baseline and to help confirm that the specific mitigation measures are effective.

Response to Comment R-BU7-66

The EIS/EIR does not defer analysis of mitigation measures. As discussed in the introductory portion of Section 4.9.4.1 of the Draft EIS/EIR, a qualitative performance standard of preventing damage to buildings has been identified. Measures to limit ground movement are location-specific, and rely partly on building surveys which must be performed immediately before the start of construction in order to document a true baseline condition of the buildings. The mitigation measure has been expanded in the Section 4.9.4.2 of this Final EIS/EIR and incorporated into the Mitigation Monitoring and Reporting Program for the Locally Preferred Alternative (Chapter 8 of this Final EIS/EIR) as mitigation measure number GT-1. The expanded mitigation measure cites quantitative thresholds that will be used as performance criteria, in addition to the qualitative performance standard already established in the Draft EIS/EIR. Settlement and methane mitigation measures from Appendix U, Geotechnical/Subsurface/ Seismic/Hazardous Materials Technical Memorandum, of the Draft EIS/EIR have also been expanded with additional specificity and standards in Section 4.9.4.2 and the Mitigation

Monitoring and Reporting Program for the Locally Preferred Alternative (Chapter 8) of this Final EIS/EIR.

Response to Comment R-BU7-67

Please refer to Response to Comment R-BU7-12, above.

Response to Comment R-BU7-68

Please refer to Response to Comment R-BU7-12, above. Determining any impacts related to relocation and/or redevelopment of the properties necessary for construction would be speculative. The Regional Connector project has independent utility. The relocation and redevelopment does not affect the scope of the Regional Connector project.

Response to Comment R-BU7-69

Please refer to Responses to Comments R-BU7-68 and R-BU7-12, above. Each Metro rail project has independent utility. Each is a separate project which stands alone regardless of whether other projects are implemented.

Response to Comment R-BU7-70

This Final EIS/EIR, which consists of the Draft EIS/EIR (revised to reflect refinements to the Locally Preferred Alternative), the Supplemental EA/Recirculated Draft EIR Sections, and all comments received on the two documents, as well as responses to such comments, is complete and adequate pursuant to both CEQA and NEPA. No revisions or recirculation are required.

Metro
One Gateway Plaza
Los Angeles, CA 90012-2952

Dear Mr. Leahy:

The Arts District Business Improvement District (ADBID) respectfully submits this letter with our comments on the Regional Connector Project Draft EIS/EIR.

BACKGROUND

The ADBID represents 200 property owners and 400 businesses employing 5,300 individuals in the eastern portion of Downtown Los Angeles. In 2006, these property owners voted in favor of a property tax assessment in order to provide a higher level of services than the City can provide. Through this commitment to neighborhood betterment, the Arts District BID was formed.*

The BID provides maintenance, security, marketing and economic development advocacy to its members spanning 53 blocks bounded roughly by the 101 Freeway, Alameda St., Seventh St., and the Los Angeles River. The Arts District is a vibrant and evolving community comprising arts, industry and innovation, and which is presently capturing its rightful place as Downtown's most exciting community.

ARTS DISTRICT BUSINESS IMPROVEMENT DISTRICT (ADBID) COMMENTS REGIONAL CONNECTOR PROJECT DRAFT EIS/EIR

1

OUR POSITION

The AD BID supports the Fully Underground LRT Alternative for the following reasons:

- Only the Fully Underground LRT creates a new station at 2nd/Central that has the ability to provide Arts District stakeholders with the full benefits of the Regional Connector project. In the At Grade Emphasis and Underground Emphasis Alternatives, the existing Little Tokyo/Arts District Gold Line Station would remain, and would only provide direct access to the Regional Connector's north-south route. Patrons from the Arts District would either still need to transfer to access the east-west route, or would need to walk (on average) a half mile to the proposed

* The ADBID recently renewed for another five year term by a 70% affirmative majority. Beginning in January 2011, the ADBID will slightly expand its boundaries increasing its stakeholders to 743.

725 South Crocker Street • Los Angeles CA 90021-1411 • 213.228.8484 fx 213.228.8488 • www.artsdistrictla.com

2nd and Broadway station or the 2nd and Los Angeles station, whichever is selected, to travel east and west. Either solution would defeat the primary goal of the Regional Connector project (increased utilization as a result of reduced transfers and trip times) for the Arts District community.

- The Fully Underground LRT has fewer and less severe construction impacts on Alameda than the other alternatives. This will result in far fewer traffic and economic impacts for Arts District residents, commercial and industrial businesses. Alameda is a major arterial – a literal lifeline for the Arts District as well as the adjoining industrial areas of Downtown. Negative impacts to Alameda equal direct costs to area businesses. 1 cont'd

- No at-grade train operations would pass through the two intersections of 1st and Alameda Streets and Alameda and Temple Streets.

- Existing bus service in the area will see the fewest impacts and disruptions under this alternative. Bus service is critical for many of the industrial employees in the area.

- The long-term impacts to Arts District intersections are significantly less with the Fully Underground Alternative.

CONCERNS & REQUESTED MITIGATIONS

Parking

To the extent that the various alternatives require the permanent and/or temporary removal of parking on 2nd Street in Little Tokyo, the ADBID is concerned that displaced/overflow parking will end up in the Arts District. The Arts District shares a border with and lies immediately to the east of the area most impacted by reduced parking. The area's parking is mix of metered and unmetered spaces, but is already heavily utilized 24 hours/day.

The "At Grade Emphasis LRT" would have the worst possible impact -- permanently displacing 24 parking and loading spaces on 2nd Street due to the permanent closure of the eastbound parking lane (Figure 3-6.) It would temporarily displace 52 parking spaces and 6 loading zones on 2nd Street and another 13 parking and loading spaces on Alameda (Table 3-10.) The "Fully Underground LRT" will have temporary impacts, but relatively minor long-term impacts to parking. 2

The ADBID would request that the area's potential for displaced/overflow parking impacts be acknowledged as well in each of the alternatives. There are several places in the DEIS/DEIR where it says that the various alternatives "would result in an adverse [parking] impact only in the Little Tokyo community portion of the alignment." Little Tokyo parking is fully utilized and we see no opportunity for it to increase its parking capacity in the short term. While no parking spaces are being removed in the Arts District, it is the neighborhood immediately adjacent to the majority of the temporary and permanently displaced parking spaces, and is the area most likely for displaced visitors to seek on-street parking.

Removal of Signalized Intersection at 1st & Hewitt Streets

One of our major remaining concerns with our preferred Fully Underground LRT Alternative is the observation that the signalized intersection at 1st and Hewitt Streets would be removed, eliminating the ability to cross 1st Street at that location. While it is our understanding that this is necessary to allow the creation of a portal connecting the existing Eastside Gold Line with the new 2nd/Central station, we are very concerned about pedestrian impacts. If this signal is removed, there will be no ability for a pedestrian to cross 1st Street anywhere between Alameda and Vignes Streets. This 3

signal is the *only* legal crossing point between Alameda and Vignes. The distance from one signalized intersection/pedestrian crossing (Alameda to Vignes) will then be one quarter of a mile (approximately 1300 feet/4 blocks.)

The ADBID has significant safety concerns that pedestrians might choose to cross the tracks illegally rather than walk several blocks out of the way. In addition, the lack of crossing further severs the northernmost portion of the Arts District from the heart of the district, and also weakens the connectivity between the Arts District and Little Tokyo's northeasternmost uses. We believe that a lack of pedestrian connections could irreparably harm the future redevelopment of the portion of the Arts District that lies north of 1st Street. 3 cont'd

The ADBID would request, therefore, that Metro consider the feasibility of adding a pedestrian bridge in this area in order to mitigate the adverse impacts of eliminating the signalized intersection and crosswalk at Hewitt. Specifically, we would ask that this potential mitigation be added to those already listed in Section 3.4.2.2.4 of the EIR/EIS.

Request for Involvement in Construction Planning and Notification of Project Impacts

The ADBID's other major concern are the impacts associated with construction of the Regional Connector. The ADBID would like to be involved in future discussions related to the project's Construction Mitigation Program and Worksite Traffic Control Plans, as well as the final haul route decisions that will be made in the preliminary engineering phase. 4

The ADBID would ask Metro to take note that there are a number of residential and live/work buildings in the Alameda/1st/Vignes/2nd Sts. Area that may be impacted by nighttime construction and nighttime haul routes, especially the proposed staging area at 1st/Alameda. The ADBID requests that the appropriate construction documents and haul route maps show the location of all residential buildings and other 24-hour uses. 5

The ADBID also requests priority notification from Metro and/or its contractor(s) when construction impacts will occur. The ADBID has the ability to disseminate closure and other information quickly to a majority of residents, businesses and property owners in the immediate area. This will undoubtedly help reduce the number of questions and complaints likely to be fielded by Metro and its contractor(s.) 6

Lastly, the Draft EIS/EIR notes "most construction along the rest of the alignment would take place during the nighttime and weekend hours" and "haul trips would take place during off-peak hours when there is excess capacity on the roadway network" and "driveway access for residences would be maintained at all times...driveway access to business would be maintained for normal business operating hours (Sections 3.3.3.1.2 and 3.4.1.2)." Please note that the majority of the area's industrial businesses do not keep normal business operating hours. Most industrial businesses begin operations between midnight and 6 AM, and some operate 24 hours/day. The involvement of the ADBID at the planning stage, combined with advance notification, is desperately needed to avoid adverse economic impacts on local businesses. 7

Miscellaneous Comments

- The AD BID requests that Metro improve lighting, sidewalks and other public ROW elements in order to provide safer and more attractive pedestrian and bicycle connections between the Arts District and the 2nd and Central station. Improved connections are most needed at 1st, 2nd and 3rd/Traction. 8
- The AD BID supports the inclusion of bicycle racks/lockers and would ask that Metro examine the feasibility of adding bike sharing systems to its Downtown rail stations. 9
- While the AD BID supports the Fully Underground LRT Alternative (which would not require an underpass on Alameda), if Metro selects an alternative that includes the construction of an underpass on Alameda, the AD BID would like to be included in these 10

discussions and decisions, as the impacts to area stakeholders will be significant, especially to the industrial businesses located on both sides of Alameda. As noted in the Draft EIS/EIR, traffic congestion and delays on Alameda are likely to impact Central Avenue, another major arterial primarily serving the industrial community represented by the Downtown Industrial District BID, which is also administered by the Central City East Association. 10 cont'd

- Just as the existing Eastside Gold Line station at First and Alameda acknowledges both the Arts District and Little Tokyo, it is our hope that the new Second and Central Station will likewise acknowledge the two communities that it will serve. 11

CONCLUSION

We thank you for your consideration and attention to our concerns, and appreciate staff's recommendation to select the Fully Underground LRT Alternative. We hope that the Metro Board of Directors will agree. 12

Sincerely,

ESTELA LOPEZ
Executive Director

R-BU8

Responses to Comments from Downtown LA Arts District Business Improvement District, Lopez, Estela

Response to Comment R-BU8-1

Thank you for this information about the Downtown LA Arts District Business Improvement District (ADBID). Support for the Fully Underground LRT Alternative is noted. The Metro Board of Directors voted on October 28, 2011 to designate the Fully Underground LRT Alternative as the Locally Preferred Alternative. As noted in the introduction to Chapter 2, Alternatives Considered, of the Supplemental EA/Recirculated Draft EIR Sections and this Final EIS/EIR, refinements made to the Locally Preferred Alternative since publication of the Draft EIS/EIR involve repositioning the 2nd/Central Avenue station on the same block, moving it closer to the intersection of 1st Street and Central Avenue. Despite the repositioning, it would still be located on the same block and serve the same communities. The station would still have direct access to the proposed North-South and East-West Lines.

Metro understands the importance of Alameda Street to the Arts District and adjoining industrial areas. It is also Metro's goal to minimize impacts to bus service and traffic flow as a result of the Regional Connector project. The Fully Underground LRT Alternative was developed, in part, with the goal of reducing construction impacts on Alameda Street. No regular at-grade train service is planned through the intersections of 1st and Alameda or Alameda and Temple Streets. Some movement of trains through these intersections may still be needed on an infrequent basis.

Response to Comment R-BU8-2

The Mitigation Monitoring and Reporting Program for the Locally Preferred Alternative (Chapter 8 of this Final EIS/EIR), includes mitigation measures to address construction-related parking reductions in Little Tokyo. Among them, Metro would provide 200 self-parking spaces on the Mangrove property, which would be capable of holding 300 cars if supplemental parking services (such as valet) are implemented. This mitigation to address parking impacts in Little Tokyo would also mitigate the potential for spillover parking into adjacent neighborhoods including the Arts District.

The At-Grade Emphasis LRT Alternative was not designated as the Locally Preferred Alternative for the Regional Connector project. The Metro Board of Directors voted on October 28, 2011 to designate the Fully Underground LRT Alternative as the Locally Preferred Alternative. The Fully Underground LRT Alternative was developed with a primary goal of reducing construction-related disruption, including parking displacement, in Little Tokyo. Metro is focusing its efforts on refining the Locally Preferred Alternative to further reduce impacts, rather than attempting to refine the non-Locally Preferred Alternative alternatives which would have greater overall impacts.

Response to Comment R-BU8-3

This elimination of through north-south traffic movement at the intersection of 1st and Hewitt Streets was included in Sections 2.3.6.2 and 3.3.5.2.2 of the Draft EIS/EIR and this Final EIS/EIR. The portal would be surrounded on three sides by safety barriers such as fencing that would

deter illegal pedestrian crossings. There are no streets between Alameda and Vignes Streets that continue north beyond 1st Street, so it is unclear how the elimination of the north-south pedestrian crossing at 1st and Hewitt Streets would impede access to the area north of 1st Street from the central portion of the Arts District. Pedestrians must currently walk to Alameda or Vignes Streets to access this area, and this would not change as a result of the Regional Connector.

Metro has received input from the Little Tokyo community opposing pedestrian bridges in the vicinity of 1st and Alameda Streets. As explained above, such a bridge is not warranted by the Regional Connector project.

Response to Comment R-BU8-4

Metro looks forward to continued coordination with ADBID. Haul routes would be confirmed with community input, and haul trips would be scheduled at times that minimize disruption, per mitigation measure numbers TR-2 and EJ-21 in the Mitigation Monitoring and Reporting Program for the Locally Preferred Alternative (Chapter 8 of this Final EIS/EIR).

Response to Comment R-BU8-5

Metro is aware of these residential buildings, and has analyzed the potential noise impacts on all sensitive receptors close to the proposed alignment and construction areas in Section 4.7, Noise and Vibration, of the Supplemental EA/Recirculated Draft EIR Sections. Noise mitigation measures in the Supplemental EA/Recirculated Draft EIR Sections have been incorporated into Section 4.7.2 and the Mitigation Monitoring and Reporting Program for the Locally Preferred Alternative (Chapter 8) of this Final EIS/EIR.

Response to Comment R-BU8-6

Metro will coordinate with the community, including ADBID, regarding construction activities through the Regional Connector Community Leadership Council (RCCLC), as provided in mitigation measure numbers CN-4 and CN-5 in the Mitigation Monitoring and Reporting Program for the Locally Preferred Alternative (Chapter 8 of this Final EIS/EIR). It is Metro's goal to provide timely information to the community.

Response to Comment R-BU8-7

The operating hours of the Arts District industrial businesses is noted. Metro's commitment to maintain access to businesses during their operating hours is provided in mitigation measure number TR-1 in the Mitigation Monitoring and Reporting Program for the Locally Preferred Alternative (Chapter 8 of this Final EIS/EIR). Metro will continue meeting with ADBID to coordinate planning and construction activities. It is Metro's goal to minimize impacts to businesses.

Response to Comment R-BU8-8

As shown in mitigation measure number CN-8 of the Mitigation Monitoring and Reporting Program for the Locally Preferred Alternative (Chapter 8 of this Final EIS/EIR), Metro would implement an "Arts District Path" and would invite community and Southern California Institute of Architecture participation in its design. The path would include sidewalk enhancements, way finding, appropriate lighting, and crosswalk improvements.

Response to Comment R-BU8-9

Bicycle facilities would be incorporated into station designs where feasible per Metro's design criteria. Metro will continue to examine ways to enhance connections between bicycles and transit.

Response to Comment R-BU8-10

The Metro Board of Directors voted on October 28, 2011 to designate the Fully Underground LRT Alternative as the Locally Preferred Alternative. The Locally Preferred Alternative does not include an underpass on Alameda Street. Metro will coordinate with the community, including ADBID, regarding construction activities through the RCCLC, as provided in mitigation measure numbers CN-4 and CN-5 in the Mitigation Monitoring and Reporting Program for the Locally Preferred Alternative (Chapter 8 of this Final EIS/EIR).

Response to Comment R-BU8-11

It is Metro's goal to have the 1st/Central Avenue station incorporate the identities of both Little Tokyo and the Arts District through design in consultation with the communities and through the implementation of mitigation measure numbers CN-8 and CN-9 in the Mitigation Monitoring and Reporting Program for the Locally Preferred Alternative (Chapter 8 of this Final EIS/EIR).

Response to Comment R-BU8-12

Thank you for your comment. The Metro Board of Directors voted on October 28, 2011 to designate the Fully Underground LRT Alternative as the Locally Preferred Alternative.

RE: Metro Public Comment
Future 5th & Flower Station - Preclusion avoidance

Ms. Roybal Saltarelli,

This letter is in response to the Regional Connector Supplemental FEIS/R released on July 22, 2011.

As you know, the much needed 5th & Flower Station was deleted on October 2010 as a quick mitigation measure to cost overruns, in order to meet a critical funding deadline. However, considering the multi-century lifetime of the Regional Connector, in would be imperative to allow for the re-insertion of the station at a future date in order to serve LA County's location of highest employment density.

Thank you for responding to the community's transit needs by allowing such receptivity to a future 5th & Flower Station. Per S-DEIS/R, Chapter 2.0, page 2-1: "However, the project design would not preclude construction of a station at this location as a future, separate project. Also, per S-DEIS/R, Chapter 2.0, page 2-2: "A pocket track, which could also serve as a crossover, would be located beneath Flower Street between 5th and 6th Streets. This would allow for a possible future station at this location to be constructed as a separate project."

However, there are two design items indicated in the Supplemental DEIS/R that <u>would</u> preclude a future 5th & Flower Station: 1

1. <u>The location of a substation between 5th & 4th Streets.</u> Per DEIS/R, Chapter 2.0, page 2-2: A traction power substation (TPSS) would be located along Flower Street between 5th and 4th Streets in the deleted Flower/5th/4th Street station location"

2. <u>A sloped grade between 5th & 4th & Streets.</u> Per DEIS/R, Appendix R-1, Engineering drawing C-102, an 0.88% grade is indicated, in lieu of the 0.00% grade indicated on the DEIS/R drawings released in August 2010.

Please forward these design items to Metro staff for correction. Thank you. I've included a portion of Chapter 2.0 and Appendix R-1 for reference. I look forward to the completion of the Regional Connector, but also to the 5th & Flower Station, whether concurrent with the Regional Connector or at a later date.

Sincerely yours,

Duane B. Weisenhaus, AIA, LEED AP

Metro

Chapter 2 ALTERNATIVES CONSIDERED

This chapter discusses how the alternatives studied in the Draft EIS/EIR were developed. All of the proposed build alternatives meet the purpose and need outlined in Chapter 1 of the Draft EIS/EIR.

This chapter includes a detailed discussion of the alternatives identified for additional study and alternatives that were analyzed and subsequently eliminated from consideration. These alternative analyses were performed in compliance with the National Environmental Policy Act (NEPA), the California Environmental Quality Act (CEQA), the Safe, Accountable, Flexible, Efficient Transportation Equity Act: A Legacy for Users (SAFETEA-LU), and all applicable associated guidance.

The Regional Connector Transit Corridor Project Draft EIS/EIR was made available to identified stakeholders, agencies, and the general public for review and comment for a 45-day review period from September 3, 2010 through October 18, 2010. On October 28, 2010, the Metro Board of Directors voted to designate the Fully Underground Light Rail Transit (LRT) Alternative without the Flower/5th/4th Street station as the Locally Preferred Alternative (LPA). However, the project design would not preclude construction of a station at this location as a future, separate project. This chapter has been updated since publication of the Draft EIS/EIR based on refinements to the LPA, which were undertaken in order to reduce impacts. A vertical line in the margin is used to show where revisions have occurred to this chapter since publication of the Draft EIS/EIR.

Based on comments received on the Draft EIS/EIR and input received from community meetings, the following refinements, which are described in further detail in Section 2.3.6 and Section 4.18.2, Construction Impacts - Affected Environment, herein below, were made to the LPA to reduce or avoid previously identified impacts:

- An enhanced pedestrian walkway would be created along the west side of Flower Street from the 4th Street and Flower Street area to the existing 7th Street/Metro Center Station entrance at 7th and Flower Streets.
- At 2nd Street and the pedestrian signal to the Japanese Village Plaza (JVP), the tracks would continue underground heading northeast under the plaza and 1st and Alameda Streets.
- The proposed Little Tokyo/Arts District underground station, 1st/Central Avenue station (previously called 2nd/Central Avenue station), would be partially located within Central Avenue and the northern half of the block bounded by 1st Street, Central Avenue, 2nd Street, and Alameda Street.
- The Tunnel Boring Machine (TBM) would be inserted at the property northeast of 1st and Alameda Streets, the Mangrove property (formerly known as the Nikkei development), and transported underground to Central Avenue, where it would begin excavating westward (refer to Section 4.18.2, Construction Impacts- Affected Environment, herein below for more detail).
- Tunnel boring activities from the new insertion site would proceed farther down Flower Street to 4th Street instead of ending at the proposed 2nd/Hope Street station (refer to Section 4.18.2, Construction Impacts- Affected Environment, herein below for more detail).

- Cut and cover on 2nd Street in Little Tokyo would not be required, which would result in less cut and cover overall during construction (refer to Section 4.18.2, Construction Impacts- Affected Environment, herein below for more detail).

- Relocation of the 2nd Street storm drain would not be required in Little Tokyo (refer to Section 4.18.2, Construction Impacts - Affected Environment, herein below for more detail).

Would preclude a future 5th/Flower Station

The following refinements were made to the LPA to improve project design:

- A pocket track, which could also serve as a crossover, would be located beneath Flower Street between 5th and 6th Streets. This would allow for a possible future station at this location to be constructed as a separate project.

- Crossovers could be located north and east of the proposed rail junction: in the tunnel beneath the Mangrove property, and beneath 1st Street just east of the intersection of 1st and Alameda Streets.

- A traction power substation (TPSS) facility would be located along Flower Street between 5th and 4th Streets in the deleted Flower/5th/4th Street station location.

- Antennas may be used as part of the LRT communication system. Antennas would not be visible from any historic resource and would not intrude on the visual quality of the surrounding neighborhood (refer to Section 2.3.3.7 herein below for more information).

In addition to modifications associated with refinements to the LPA described above, there have been modifications and corrections to this chapter in response to comments received on the Draft EIS/EIR.

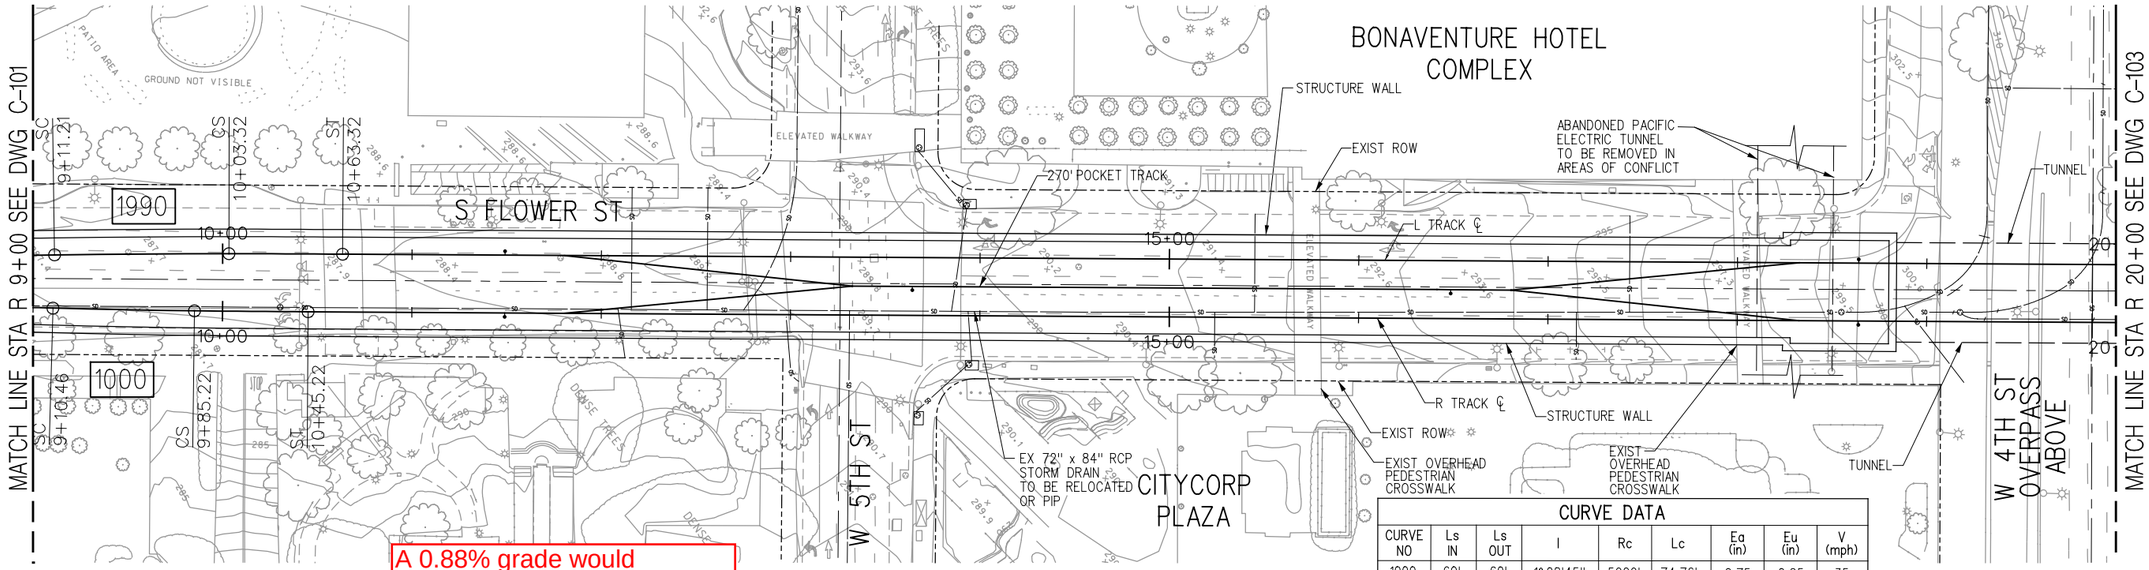
The LPA would involve construction and operation of a 1.9 mile LRT connector that would link the Metro Blue Line, Metro Gold Line, and future Metro Expo Line into a single consolidated system. All proposed build alternatives would begin underground at the existing Metro Blue Line (and future Metro Expo Line) platform at 7th Street/Metro Center Station and extend in a northeastern direction to a new junction with the Metro Gold Line near Alameda Street. Figure 2-1 shows the LRT routes and stations that were identified for study in the EIS/EIR.

2.1 Background and Planning Context

The Regional Connector Transit Corridor alternatives presented in the Draft EIS/EIR build on prior planning studies and projects from the past two decades. In particular, the early studies from 1988 to 1993 focused on extending the Metro Blue Line (light rail line) to Pasadena. The Metro Blue Line currently extends from downtown Los Angeles to Long Beach. This project was later constructed as the Metro Gold Line from Union Station to Pasadena, with the connection to the Metro Blue Line at 7th Street/Metro Center Station deferred to a later time. The Metro Expo Line (light rail line), which will extend from downtown West Los Angeles to Santa Monica, was not included in those studies, as it was not yet in the planning stages.

In addition, the Eastside Extension portion of the Metro Gold Line (light rail line), which extends from downtown Los Angeles to East Los Angeles, was initially approved as an extension of the Metro Red Line (a heavy rail subway system). The Metro Red Line currently extends from downtown Los Angeles to North Hollywood. The proposed extension to East Los Angeles was later re-scoped to the currently operating Metro Gold Line to East Los Angeles light rail system.

R-BU9



CURVE DATA								
CURVE NO	Ls IN	Ls OUT	I	Rc	Lc	Eq (in)	Eu (in)	V (mph)
1000	60'	60'	1° 08'45"	5000'	74.76'	0.75	0.25	35
1990	60'	60'	0° 52'46"	6000'	92.10'	0.75	0.25	35

A 0.88% grade would preclude a future 5th/Flower Station. A easy fix would be to flatten the grade between 4th & 5th and increase the grade north & south of the station to compensate.

A traction power station (TPSS) or any other large structure located between 4th & 5th Streets would preclude a future 5th/Flower Station.

R-BU9

Responses to Comments from Weisenhaus Architecture, Weisenhaus, Duane

Response to Comment R-BU9-1

The Metro Board of Directors voted on October 28, 2010 to designate the Fully Underground LRT Alternative, without the Flower/5th/4th Street station, as the Locally Preferred Alternative. The Flower/5th/4th Street station was excluded from the Regional Connector project as a means of lowering costs. The Locally Preferred Alternative would be constructed so as not to preclude addition of a Flower/5th/4th Street station at a later time as a separate future project.

- The now deleted 5th and Flower station site developed during the Draft EIS/EIR included a traction power substation (TPSS) and the area needed for a TPSS site. Although the station has been deleted, the TPSS can still be located at the site/space it had been previously identified for without encroaching into the area that was previously identified in the Draft EIS/EIR for the 5th and Flower station. Therefore, the TPSS would not preclude the building of the 5th and Flower Station in the future because adequate space underground would still be available.

- Metro's design criteria for maximum slopes at station platforms is one percent. The slope identified is less than one percent; therefore, the slope grade between 5th and 4th Street is suitable for a station in the future.

September 2, 2011

Mr. Art Leahy
c/o Ms. Dolores Roybal Saltarelli
Project Manager
Metro
1 Gateway Plaza, MS 99-22-2
Los Angeles, CA 90012

Dear Mr. Leahy,

On September 1, 2011, some of the members of The Westin Bonaventure Hotel and Suites' Executive Team met with Metro representatives regarding the Regional Connector Transit Corridor preliminary construction plan. The Metro representatives presented the tunneling plan from Second Street that would continue to Fourth Street on Flower Street. Metro explained that the plan from Fourth Street down Flower to Seventh Street would be done using a "cut and cover method". We also reviewed plans that would set "Construction Work Areas" in two lanes from Fourth Street to Sixth Street on the West side of Flower Street directly in front of the Hotel. 1

This letter is written per the request of the Metro representatives. It explains our objections from an operational standpoint. Please be advised that we will retain legal counsel to analyze the situation from a legal perspective and will revert back to you upon completion of that analysis.

We vehemently oppose the staging of construction work in front of The Westin Bonaventure Hotel. Moreover, any construction work related to the Regional Connector must be carefully planned and implemented to prevent damage to the Hotel and disturbance of our guests. The plan as explained to us at our meeting fails to do this. The Hotel has on average 569,000 guests sleeping in our rooms annually. Out of that total, over 150,000 guests sleep during the hours of proposed construction. These guests are pilots and air crews with airlines who have contracted with us. We have very specific contract language with these guests that guarantee a distraction free environment. The planned work could possibly cause us to lose millions of dollars in business, something we cannot sit back and let happen, especially considering that there are other areas along Flower Street that may be used for construction staging and construction work areas. 2

The Westin Bonaventure Hotel experienced loud noise disturbing our guests resulting in financial loss and shifting in our building during minor excavation and construction on the corner of Fifth and Flower Streets in 2010. The size and scope of the Metro Project dwarfs the prior project. Therefore, Metro must ensure that this project in no way affects the structure of the building and the safety of our guests. To that end, we request that a preconstruction survey be completed by an independent engineering firm and that surveys be completed monthly during construction so as to guarantee that the excavation and construction do not affect the structural integrity of The Westin Bonaventure Hotel. 3

the westin bonaventure hotel and suites

t 213.624.1000 f 213.612.4800
www.thebonaventure.com

WESTIN
HOTELS & RESORTS

The Regional Connector Project must also maintain 24-hours per day and 7-days per week the exact same decibel levels that exist today. Construction scheduling for work from Third Street to Sixth Street on Flower Street must be reviewed and approved by The Westin Bonaventure Hotel. Scheduling also must be flexible on short notice due to the short term booking window for both rooms and meeting/catering business at The Westin Bonaventure Hotel. The 2-week and 3-month "look ahead" needs to be modified to daily, two week and three month planning. 4

Noise and vibration monitoring equipment must be installed on all four sides of The Westin Bonaventure Hotel. If noise or vibration exceeds existing decibel levels, construction must stop immediately. 5

Metro must provide business interruption and perceived business interruption coverage for this project. The possibility of loss of existing contracted business must be prevented. Metro must present a plan acceptable to us that addresses our concerns and mitigates our losses. 6

In closing, let me reiterate that we are opposed to the existing preliminary plan and we request that Metro address all concerns in this letter. 7

Sincerely

Michael Czarcinski
Managing Director

WESTIN
HOTELS & RESORTS

R-BU10

Responses to Comments from Westin Hotels & Resorts, Czarcinski, Michael

Response to Comment R-BU10-1

The proposed use of tunnel boring machine excavation extending to 4th and Flower Street, and cut and cover excavation between 4th Street and the existing 7th Street/Metro Center Station is shown in Figure 2-14 of the Supplemental EA/Recirculated Draft EIR Sections. Drawings showing the proposed construction staging areas for the project are included in Appendix R-1, Locally Preferred Alternative Drawings, of the Supplemental EA/Recirculated Draft EIR Sections. Some of the construction staging areas in the vicinity of the Westin Bonaventure Hotel and Suites have since been reduced, as reflected in Appendix 1, Locally Preferred Alternative Drawings, of this Final EIS/EIR. Thank you for providing the additional information regarding hotel operations. The concerns in this comment letter are addressed in the responses below.

Response to Comment R-BU10-2

Comment noted. Mitigation measures have been identified and will be implemented during construction of the Locally Preferred Alternative, which involve a survey of all structures within 21 feet of the anticipated vibration-producing construction activity to verify the building category, structural condition, and to provide a baseline for monitoring of ground-borne vibration and the potential for ground-borne vibration to cause damage. During construction, use of building protection measures such as underpinning, soil grouting, or other forms of ground improvement, use of lower vibration equipment and/or construction techniques, combined with a geotechnical and vibration monitoring program would be used to protect identified historic and sensitive structures. With implementation of mitigation measures identified in Section 4.7.4.2.1 of this Final EIS/EIR, construction-related vibration impacts to historic and sensitive buildings located within 21 feet of the anticipated vibration-producing construction activity would not be adverse. In addition, consistency with the goals of the applicable local ordinances and implementation of best management practices (BMPs), would ensure that noise levels associated with construction of the Locally Preferred Alternative would not result in an adverse effect under NEPA or a significant impact under CEQA to sensitive land uses.

Metro is committed to working with the surrounding community and businesses prior to and during construction of the project. To reduce community and neighborhood impacts associated with construction, mitigation measure number CN-6 (as identified in this Final EIS/EIR) requires Metro to develop a construction mitigation plan with community input to directly address specific construction impacts in the project area. Metro shall establish and receive input from the Regional Connector Community Leadership Council (RCCLC) in developing the construction mitigation plan. The RCCLC shall consist of representatives from all parts of the alignment area. Metro shall work with the RCCLC in developing the outreach plan, which will notify local communities and the general public of construction schedules and road and sidewalk detours.

Economic and fiscal impacts associated with construction of the project are analyzed in Section 4.14, Economic and Fiscal Impacts, and Appendix BB, Economic and Fiscal Impacts Technical Memorandum, of this Final EIS/EIR.

Response to Comment R-BU10-3

Construction noise experienced during the separate non-Metro plaza renovation project is noted. Since this was not a federally-funded transit project, it was not subject to the same stringent Federal Transit Administration (FTA) noise and vibration regulations that will apply to Regional Connector construction. Safety and security mitigation measures were included in Section 4.15.4 of the Draft EIS/EIR to ensure the safety of construction activities. These mitigation measures have been incorporated into Section 4.15.4.2 and the Mitigation Monitoring and Reporting Program for the Locally Preferred Alternative (Chapter 8) of this Final EIS/EIR. Metro does not anticipate that the Regional Connector project will cause any damage to the structural integrity of the hotel. As discussed in Section 4.7.3.5.1 of the Draft EIS/EIR, Supplemental EA/Recirculated Draft EIR Sections, and this Final EIS/EIR, Metro would conduct a pre-construction survey of all structures within 21 feet of anticipated vibration-producing construction activity to verify the building category (type of construction), structural condition, and to provide a baseline for monitoring construction effects. This mitigation pertains to both geotechnical and vibration impacts. During construction, use of building protection measures such as underpinning, soil grouting, or other forms of ground improvement, use of lower vibration equipment and/or construction techniques, combined with a geotechnical and vibration monitoring program would be used to protect identified sensitive structures. These mitigation measures were included in Sections 4.7.4.1 and 4.9.4.1 of the Draft EIS/EIR and Supplemental EA/Recirculated Draft EIR Sections, Section 4.7.4.2.1 and 4.9.4.2.1 of this Final EIS/EIR, and are included as mitigation measure numbers NV-1 and GT-1 of the Mitigation Monitoring and Reporting Program for the Locally Preferred Alternative (Chapter 8 of this Final EIS/EIR). In the unlikely event that there is damage due to construction, Metro would ensure that any damage caused by construction is repaired to pre-construction survey condition.

Response to Comment R-BU10-4

Noise impacts associated with construction of the project are analyzed in Section 4.7, Noise and Vibration, of this Final EIS/EIR. Metro will require the construction contractor to be consistent with the goals of Section 41.40(a) of the Los Angeles Municipal Code, and the goals of other applicable local ordinances, and to implement BMPs to ensure that noise levels associated with construction of the Locally Preferred Alternative would not result in an adverse effect under NEPA or a significant impact under CEQA to sensitive land uses.

As indicated in Response to Comment R-BU10-2, above, Metro will work with the RCCLC to serve all businesses affected by construction of the Regional Connector. The committee shall also be kept apprised of construction progress and upcoming transit, parking, or access changes.

Response to Comment R-BU10-5

Comment noted. Please refer to Responses to Comments R-BU10-2 and R-BU10-4, above. Geotechnical and ground-borne vibration monitoring shall be conducted during construction as part of mitigation to avoid any damage to sensitive buildings (Category I, II, III, IV buildings as defined by FTA in Table 4.7-4 of the Supplemental EA/Recirculated Draft EIR Sections and this Final EIS/EIR) or historic buildings due to construction-induced vibration. Monitors will be located at points of the maximum potential impact as appropriate.

To reduce community and neighborhood impacts associated with construction, a 24-hour live hotline for community concerns regarding construction shall be provided. Residents and businesses shall also be provided with comment/complaint forms during construction. A construction office shall also be placed within the community to provide in-person assistance and services. The hotline and office shall enable Metro to maintain day-to-day contact with the community during construction and provide community members with all project details that may be relevant to the public.

If a noise complaint is filed during project construction, noise monitoring shall be conducted in the vicinity of the area in question. If monitored noise levels exceed FTA construction noise criteria, the contractor shall use all or a combination of the measures identified in Section 4.7, Noise and Vibration, of this Final EIS/EIR to reduce construction noise levels below FTA construction noise criteria.

Response to Comment R-BU10-6

Metro would maintain access to the hotel at all times during operating hours, as indicated in mitigation measure number TR-1 in the Mitigation Monitoring and Reporting Program for the Locally Preferred Alternative (Chapter 8 of this Final EIS/EIR). Metro would also adhere to FTA noise criteria and mitigation measures in Section 4.7.4 of the Supplemental EA/Recirculated Draft EIR Sections to further reduce noise and vibration impacts. These mitigation measures have been incorporated into Section 4.7.4.2 and the Mitigation Monitoring and Reporting Program for the Locally Preferred Alternative (Chapter 8) of this Final EIS/EIR. These mitigation measures would minimize the potential for business disruption. Metro will continue to work with the hotel management to ensure minimization of business interruption. Metro will coordinate with the community, including Westin Bonaventure Hotel and Suites, regarding construction activities through the RCCLC, as provided in mitigation measure numbers CN-4 and CN-5 in the Mitigation Monitoring and Reporting Program for the Locally Preferred Alternative (Chapter 8 of this Final EIS/EIR).

Response to Comment R-BU10-7

Opposition to the preliminary information is noted. Metro will continue to work with the hotel management throughout the project process. Metro has addressed the comments in this letter in the responses above.

Responses to Comments from Fixing Angelenos Stuck in Traffic (FAST), Norton, Hilary

Response to Comment R-CN1-1

Comment noted. The Locally Preferred Alternative designated by the Metro Board of Directors on October 28, 2010 does not include a station at 5th and Flower Streets. However, the Locally Preferred Alternative would be designed so as not to preclude a station from being added at this location as a separate future project.

Subject: Colburn School Comment on Connector EIR

Dear Dolores:

Thank you for presenting to the Colburn School Facilities Committee this morning. We are aware that the current comment period ends today at 5 PM. Therefore, the Colburn School would like to voice its concern regarding potential noise issues related to the construction and in particular the operation of the proposed Regional Connector Transit Corridor as it passes in close proximity to our campus.

The Colburn School is an internationally recognized performing arts institution with a $200 million campus that contains two world class concert halls, recording facilities, studios, practice rooms, and rehearsal spaces. Over 200 public performances of music and dance take place annually on our campus including long-standing series by outside performing arts organizations such as the Los Angeles Chamber Orchestra, LA Opera, and Camerata Pacifica. Additionally, our recording facilities are used for professional recordings year around. Given the importance of optimal conditions for the rehearsal, performance and recording of music, we are understandably concerned by any increased noise that the Light Rail may produce in its construction and daily operation.

We hereby request additional study by Metro of vibration and noise related to The Colburn School property and appropriate to the institution's classification as a premiere performance and recording facility. The Colburn School's use by multiple stakeholders, core mission of performance, and positioning on the cultural corridor warrant sound attenuation equal to that required by The Music Center's Disney Hall. We look forward to working with you in the coming months to better understand our specific needs and requirements and the impact of the connector on our operations.

Responses to Comments from The Colburn School, Kardan, Sel

Response to Comment R-CN2-1

In the area beneath the Colburn School, the LRT tunnels would be located approximately 50 feet below the 2nd Street Tunnel, within the public right-of-way. There is no special track work planned for this area. Per the as-built drawings of the Colburn School, the foundations of the school are located just south of the 2nd Street Tunnel and do not extend below the depth of the 2nd Street Tunnel.

According to Federal Transit Administration (FTA) land use criteria, the Draft EIS/EIR identified this site as a Category 3 land use, which are institutional land uses with primarily daytime uses that depend on low noise as an important part of operations (e.g., schools, libraries, theaters, places of study, and churches). The noise and vibration analysis using the Category 3 land use classification determined that no adverse effect under NEPA or significant impact under CEQA would occur at the Colburn School during construction. In response to the commenter's request, in Section 4.7, Noise and Vibration, of this Final EIS/EIR, the Colburn School is now analyzed as a Category 1 land use, which are buildings or parks where low noise is an essential element of their purpose (e.g., amphitheaters and concert pavilions). Although the Colburn School is properly considered as a Category 3 land use in this analysis, if the Colburn School were a Category 1 land use, there is a potential for ground-borne noise generated during construction and operation of the Locally Preferred Alternative to impact the Colburn School facilities. Please refer to Section 4.7, Noise and Vibration, of this Final EIS/EIR for a detailed analysis of noise and vibration impacts to the Colburn School. In an abundance of caution, Metro shall apply similar construction and operational mitigation measures that were identified for the Walt Disney Concert Hall, for the Colburn School. After implementation of the mitigation measures, ground-borne noise impacts at the Colburn School would be reduced to not adverse under NEPA and less than significant under CEQA. Refer to Section 4.7.4.2 for a list of mitigation measures identified for the Colburn School.

Community Connector Coalition

Advocates for the
Completion of the
Missing Link in
Los Angeles Rail Transit

August 30, 2011

Ms. Dolores Roybal Saltarelli, AICP
and Regional Connector Team, Metro
One Gateway Plaza, MS 99-22-2
Los Angeles, California 90012-2952

Mr. Ray Tellis, Team Leader
Federal Transit Administration
888 South Figueroa Street, Suite 1850
Los Angeles, California 90017

Ladies and Gentlemen:

The Community Connector Coalition is a growing group of property owners, stewards, and users on and around Bunker Hill, the Historic Core, Civic Center, Little Tokyo, and the Arts District. Among its supporters, the Coalition counts office building owners and tenants, hotel building owners, residential building and unit owners and tenants, and cultural and educational institutions.

We welcome this opportunity to comment on the Regional Connector, in connection with your circulation of the July 22, 2011, Supplemental EA / Recirculated Sections of the Draft EIR. Our review of the revised Chapter 2 and the revised portions of Section 4.18.2, especially relating to Construction Impacts -- and specifically those impacts related to the narrow Second Street and its myriad underground utilities, in particular the very large Los Angeles County storm drain -- leads us to respectfully submit these comments / suggestions now.

1

The Coalition recognizes that one of the most significant public transit investments currently being undertaken in Los Angeles County is the Regional Connector Transit Corridor Project. The Coalition seeks to maximize, for members of the traveling public, transit accessibility to and from the multiple, diverse destinations surrounding the three planned stations of the Regional Connector.

To achieve that goal, the Regional Connector first has to be built.

One very simple route adjustment will allow the Connector to be built at substantially less cost, while improving community access and eliminating several property conflicts and other impacts along the route. We believe that these proposed modest changes to Metro's currently proposed alignment and station locations lessen environmental impacts. In this letter, we have organized our comments and our recommended changes around the stations.

Using a modestly moved Regional Connector route, travelers on the Blue Line, the Expo Line, and the Gold Line -- from the southern, western, northeastern, and eastern parts of Los Angeles County -- will have improved access *to and from* these lines through *more convenient* passenger portals.

2

Bunker Hill Station: This station should have its passenger portal at the TOP and CENTER of Bunker Hill. The Bunker Hill Station portal should be located on Second Street adjoining Grand Avenue . . . not one level lower down and nearer the western edge of the Hill, over on Hope Street across from Kosciuszko Way. The location of the present passenger portal requires almost all riders to walk up a very steep hill, on streets primarily designed for automobile access to Lower Grand and to garages, rather than designed for pleasant pedestrian experiences. There is just "no there, there" at Kosciuszko and Hope.

We believe that there still is time to optimize the locating of the Bunker Hill Station so that its passenger portal can be constructed where it should be -- essentially, on Grand Avenue. We also believe that there will be construction economies (and reduction of construction impacts) for Metro in so doing. We know that there will be long-lasting patronage advantages gained by having Bunker Hill's only subway station portal situated at the TOP of the Hill, on Second Street and Grand Avenue. It is at this location that riders will find most of the Hill's offices, residences, and cultural institutions, plus the County government center and Civic Park -- within only a one or two block walk north or south along Grand Avenue. Just one block further north is the Cathedral and the High School for the Visual and Performing Arts. Just one block further south is the Central Library and more hotels. (See the accompanying drawings.) 3

Broadway / Civic Center Station: We suggest you study a modified route that turns northeast from Second Street, at Hill Street, and proceeds 45 degrees across the currently vacant Federal courthouse parcel. (See the accompanying drawings.) This modification accomplishes numerous cost-saving and public-serving purposes, while significantly reducing construction impacts. *First*, being off-street, this station location allows much less expensive cut and cover construction of the station box, whose portal will be at Broadway and First Street. This station location will be less expensive because the alignment will not be as deep because it will have crossed *north of* the Second Street storm drain and *over* the Red Line tunnel. *Second*, the station will be substantially less expensive because it no longer requires construction under that same Los Angeles County Flood Control District Second Street storm drain. *Third*, this new location will allow a pedestrian passageway to be easily constructed between the existing Red/Purple Line Civic Center Station mezzanine and the new Regional Connector Broadway / Civic Center Station mezzanine. Providing a second direct passenger connection to the Red/Purple Line at Civic Center will help alleviate the crowded conditions where all such transfers would occur at 7th and Metro Center. *Fourth*, this location will allow a 45-degree curve to continue the route east under wider First Street (apparently with far fewer utilities conflicts). 4

Little Tokyo / Arts District Station: The Connector's route adjustment in this neighborhood provides construction cost savings and reduced construction impacts on the Little Tokyo community. In this revised location (see the accompanying drawing), the temporary construction impacts on businesses fronting First and Second Streets and Central Avenue are reduced almost entirely. The new station will be partially underground and open to the sky, and it will be located next to where the existing station is now, east of Alameda Street, north of First Street, on the Mangrove Estates site. This approach also allows for integration of the new Little 5

Tokyo / Arts District Station into future development on this parcel. Construction still will be staged at the Mangrove Estates site, and the connection of the east-west lines will be a simple straight line under First Street. The new route also will eliminate the significant, permanent construction impacts on the properties south of First Street (that result from the present alignment under Second Street – which requires significant demolition or disturbance). Similarly, "cut and cover" construction impacts on Central Avenue, south of First Street, will be eliminated by the new route.

5 cont'd

The main difference that this Little Tokyo / Arts District Station relocation makes in Regional Connector service, from what is currently proposed by Metro, is that the first westbound transfer station (between the Regional Connector's east-west and north-south lines) will be a few blocks west, at Broadway / Civic Center, instead of at Little Tokyo / Arts District.

All of these modest amendments -- on Bunker Hill, at Broadway / Civic Center, and at Little Tokyo / Arts District -- increase the probability of the Regional Connector ultimately being built because costs are lowered significantly . . . for example, by: (1) eliminating the substantial civil / bridge / street work at Second and Hope Streets; (2) decreasing the excavation depths for the three stations; (3) eliminating the conflicts with the Second Street storm drain; (4) building the stations on and under the edges of now-vacant *government* parcels -- the County's Parcels Q and W on Bunker Hill, the Federal (GSA) parcel for the Broadway / Civic Center Station, and the City's Mangrove Estates parcel for the Little Tokyo / Arts District Station (with that City site also being used for the tunnel access, staging, and dirt removal east of the main parts of Little Tokyo); and (5) *not* building on *private* property, except for tunneling a bit under the Broad Museum.

6

The Community Connector Coalition's interests are on Bunker Hill primarily. But we know that there is no benefit to transit riders on Bunker Hill if there is no Regional Connector. Therefore, the Coalition looks forward to working closely and aggressively with you and your consultants so that this simple route adjustment, with its several preferable alternatives (or the best parts of them) still can be achieved. What is designed now will be what the Los Angeles public, and its visitors, experience for the remainder of this century. If what is designed now is not the most cost-effective route, we worry that funding may fall short and that the needed Regional Connector might even not get built. We want to help insure that it does. You may contact us through our representative, Stacey A. Sullivan, Esquire. She may be reached at Hill, Farrer & Burrill, 300 South Grand Avenue, Los Angeles, California 90071-3147. Her telephone number is 213-621-0871, and her email is SSullivan@hillfarrer.com. Thank you.

7

Very truly yours,

for the Community Connector Coalition

Responses to Comments from Community Connector Coalition, Broad, Eli; Kardan, Sel

Response to Comment R-CN3-1

We thank you for your comment and appreciate your participation. Metro initiated the Alternatives Analysis study in 2007 and has conducted extensive engineering studies, environmental analysis and an extensive community outreach program that included meetings with property owners and the general public since the inception of the project. Based on these efforts over the last four years, various alignments and station locations were studied including those similar to the one proposed in the letter submitted August 30, 2011. The Locally Preferred Alternative designated by the Metro Board of Directors in October 2010 and the subsequent refinements identified in the Supplement EA/Recirculated Draft EIR Sections represent the results of this effort.

Response to Comment R-CN3-2

Metro agrees with maximizing transit accessibility to and from multiple destinations surrounding the three planned stations. Metro also agrees that in order to accomplish this, the Regional Connector must first be built. As stated, Metro initiated the project development process with the Alternatives Analysis in 2007 and studied 36 different alternatives comprised of various alignments, station locations, and configurations. These alternatives were based on previous studies as well as newly introduced alternatives developed in conjunction with extensive community input. The alternatives studied have been screened over time after extensive engineering, environmental analysis, and public input. The refined Locally Preferred Alternative is the result of this effort. At each major milestone in this process, the Metro Board of Directors has been presented with the results and refinements of the undertaken studies when significant changes have been made to address community concerns, environmental issues, or engineering analysis.

Metro has reviewed the recommended modifications to the Locally Preferred Alternative in light of the environmental analysis, modifications, and Alternative Analysis previously conducted.

Response to Comment R-CN3-3

Metro's design efforts for this station have focused on both connecting to the heart of Bunker Hill and ensuring potential connections to the Flower Street corridor and areas west of Flower Street not currently well served by transit. Metro agrees that a station entrance on Grand Avenue at the top of Bunker Hill at 2nd Street would be a great opportunity. However, based on our previous engineering analysis and due diligence, Metro's technical teams identified several technical challenges which make the alignment and station location described in the August 30, 2011 letter more costly than the Locally Preferred Alternative station location and difficult to achieve. The following is a brief, and by no means exhaustive, summary of those obstacles:

- Grand Avenue is approximately 20 feet higher in elevation than Hope Street.

- The proposed station box elevation and modification of the alignment is limited to the minimum depth of the 2nd Street Tunnel. The LRT tunnel must traverse beneath the 2nd Street tunnel to get from one side of Bunker Hill to the other.

- Based on utility records, the proposed station location described in the August 30, 2011 letter would place the alignment in conflict with the 2nd Street storm drain and require the relocation of the storm drain as it crosses over the existing Metro Red/Purple line tunnels.

- In addition, the proposed (August 30, 2011 letter) station box location is located below County-owned property between Grand Avenue and Olive Street which contains a large parking structure and has previously been entitled for the major multi-billion dollar, high-rise Grand Avenue Project. In its letter submitted on October 15, 2010 in response to the Draft EIS/EIR, Related Companies was concerned with additional structure impacts to the Broad Art Foundation Museum, currently under construction, and Grand Avenue Project site. A large portion of this or other Grand Avenue Project property would be needed to stage construction for the station. Considering the steep slope on this side of Bunker Hill as compared to the Locally Preferred Alternative's 2nd/Hope Street station site, extensive shoring of Grand Avenue and 2nd Street would be required. It would also require that the planned Grand Avenue Project be reconfigured in order to accommodate the station. At the end of construction, a portion of property or other adjacent Bunker Hill property would be needed to house the station entrance, ventilation and emergency shafts, and other ancillary facilities.

- Finally, as the alignment heads west from the proposed (August 30, 2011 letter) station location, it may need to traverse beneath a portion of the Walt Disney Concert Hall. Walt Disney Concert Hall has a multi-level subsurface parking structure beneath it and foundations that extend approximately 80-100 feet below the surface. Building protection and noise and vibration considerations have previously been evaluated and would need to be re-evaluated and a subsurface easement obtained if the alignment traverses under the Walt Disney Concert Hall. The current refined Locally Preferred Alternative does not traverse under Walt Disney Concert Hall and is deeper than the proposed Aug. 30th alignment. The proposed (August 30, 2011 letter) station location may be refined to avoid traversing under the Walt Disney Concert Hall; however, due to its raised profile, mitigation measures beyond those currently planned would likely be needed for building protection and to reduce noise and vibration.

Response to Comment R-CN3-4

From 2nd/Hope Street, the proposed (August 30, 2011 letter) alignment diverts north from 2nd Street at Hill Street and traverses through a vacant site owned and planned by the federal government for a new federal court house. As discussed with the federal government in 2007 and again confirmed in 2011, the site currently has an allocation of $400 million for the proposed federal court house. It is identified as an active site and has already been certified under the NEPA process. The amount of property required for the station at this location is greater than the station identified as part of the refined Locally Preferred Alternative since it is entirely off-street. Therefore, the property acquisition costs would be substantial. In addition,

another site for the federal court house would need to be identified or a redesign of the current facility would be required to accommodate the proposed (August 30, 2011 letter) station. Neither the relocation of the courthouse or redesign were considered as cost-effective or desirable during the alternatives analysis or Draft EIS/EIR phases. Furthermore, the location of the proposed (August 30, 2011 letter) Grand Avenue station is within approximately 450 feet of the August 30, 2011 letter Broadway Station and Civic Center Metro Red/Purple Line station and approximately 900 feet from the Locally Preferred Alternative's 2nd/Broadway station. This very close proximity reduces the coverage area and could adversely impact ridership. Moreover, the location of the station and alignment proposed in the comment letter would not avoid the 2nd Street storm drain relocation construction costs similar to those associated with the Locally Preferred Alternative.

Response to Comment R-CN3-5

We appreciate the input on the alignment and station location in Little Tokyo. Metro has conducted extensive engineering and environmental analysis and has worked closely and frequently with the Little Tokyo community and representatives to develop the proposed refined Locally Preferred Alternative design from late 2007 and continues to date. The refined Locally Preferred Alternative design reflects substantial community input and currently maintains extensive support from the Little Tokyo and Arts District communities.

Here are some technical challenges with the proposed alignment and station location in the August 30, 2011 letter.

- The station location and configuration would allow riders from the Little Tokyo and the Arts District communities to only access the North-South operation as the station is north of the East-West Alignment. This would reduce the accessibility of East Los Angeles riders to the businesses and services in Little Tokyo. This would reduce ridership at a location predicted to have a significant number of boardings per the refined Locally Preferred Alternative. This would also create significant issues for this environmental justice community.

The turning radius from 1st street to the Mangrove property and then to the existing LRT bridge over the US 101 Freeway would not meet Metro design criteria and would create significant safety and operational issues at the connection to the existing LRT bridge over 101 Freeway. This turning radius is more extreme than the curve proposed at 2nd Street and Central Avenue per the Locally Preferred Alternative. Metro is proposing to increase the turning radius in the refinement in the Supplemental EA/Recirculated Draft EIR Sections. However, the turning radius from 1st Street to the Mangrove property is even more extreme because at the same time it is turning north, the alignment also needs to rise to reach the existing LRT bridge over the US 101 Freeway. LRT vehicles have a limited ability to both come down an incline and immediately enter a curve. Such a design may result in derailment and is prohibited by Metro's design criteria. The LRT needs a minimum 200-foot radius curve to connect to 1st Street and still maintain a reasonable operating speed. This radii limitation is without the additional concern of turning on an incline.

- The turning radii limitation also makes the proposed (August 30, 2011 letter) station location infeasible when combined with the 270-foot long tangent for the station platform. The station platform length when combined with the design criteria limitation of a one

percent slope will not allow adequate depth to both meet the subsurface crossing of Alameda/1st Streets and the incline up to the US 101 bridge crossing.

Response to Comment R-CN3-6

The proposed modifications represent a new alternative with elements previously studied and screened out based on engineering, environmental analysis and community input. There are several project "critical constraints" in the Aug 30th proposal that render this proposal more expensive than the Locally Preferred Alternative.

Response to Comment R-CN3-7

Metro agrees that Bunker Hill is a prime station location. As indicated, since 2007 Metro has conducted extensive engineering, environmental analysis, and community input to evaluate, screen, and develop the refined Locally Preferred Alternative. Metro will continue to meet with representatives of the Connector Community Coalition to review the technical challenges, costs, and schedule impacts associated with the proposed alignment. The Metro analysis does not support these proposed modifications or reconsideration of alternatives to replace the refined Locally Preferred Alternative.

LOS ANGELES CONSERVANCY

September 6, 2011

Re: Regional Connector Transit Corridor Project Supplemental EA /Recirculated Sections of the Draft EIR

Dear Mr. Tellis and Ms. Saltarelli:

On behalf of the Los Angeles Conservancy, thank you for the opportunity to comment on Metro's Regional Connector Transit Corridor Project Supplemental Environmental Assessment/ Recirculated Draft Environmental Impact Report (Supplemental EA/Recirc DEIR). The Los Angeles Conservancy is the largest local historic preservation organization in the United States, with over 6,000 members throughout the Los Angeles area. Established in 1978, the Conservancy works to preserve and revitalize the significant architectural heritage of Los Angeles County.

The Conservancy previously submitted comments in October 2010 for the Regional Connector Draft Environmental Impact Statement/Environmental Impact Report (Draft EIS/EIR). Subsequently, we met with Metro and its project team to discuss impacts to historic resources and potential mitigation measures as part of the Regional Connector project. While it is unfortunate that alternatives to demolition of the California Register-eligible Atomic Café/Señor Fish have not been fully explored, we submit the following comments to ensure meaningful protection of historic resources is included as part of the proposed project.

1

I. Atomic Café/Señor Fish Building, 416 E. 1st Street

2

Under the Fully Underground LRT Alternative, selected by the Metro Board of Directors as the Locally Preferred Alternative (LPA) in October 2010, the proposed route would require

demolition of the S. Kamada Restaurant/Atomic Café/Señor Fish/Coast Import Building (Atomic Café/Señor Fish Building) at 416 E. 1st Street. Located at the southwest corner of 1st Street and Alameda in Little Tokyo, the one-story building dates from the early twentieth century but is best known and culturally significant as the location of the Atomic Café. Owners Minoru and Ito Matoba first opened the restaurant at another location in Little Tokyo one year after the bombing of Nagaski and Hiroshima, and moved it to the building at 416 East 1st Street in 1965. At this location, the Atomic Café was popular with intellectuals as a late night hang-out, and under the direction of the Matobas' daughter, Nancy, became a destination for the emerging punk rock music scene in the 1970s and 1980s. Today the building houses Señor Fish, which continues the decades-long tradition as a gathering place for an eclectic crowd of artists, musicians, and intellectuals.

The Draft EIS/EIR determined the building to be eligible for the California Register of Historic Resources for its direct association with a pattern of events linked to Japanese-American: as the site of an early Japanese restaurant, as well as its long-time identity as the iconic Atomic Café. As such, it is considered a historic resource under the California Environmental Quality Act (CEQA), and its demolition for an underground station at 1st between Central Avenue and Alameda Street would constitute a significant adverse impact to a historic resource under CEQA.

2 cont'd

a. Mitigation Measures Can Be Strengthened to Reduce Impacts

As mentioned in our October 2010 Draft EIS/EIR letter, CEQA sets a higher bar for adequate mitigation measures as compared with federal Section 106 review by requiring the lead agency to evaluate and adopt all feasible alternatives and mitigation measures that avoid or substantially lessen impacts on historic resources. While Metro has proposed additional mitigation measures for potential relocation, salvage and integration of building components, or keeping portions of the building intact for use in the 1st/Central Avenue station, none of these options provide sufficient specificity to fully mitigate the loss of a historic structure. Nor are the effects of the demolition reduced to a level of insignificance. As such, it is a faulty assumption to conclude in the Supplement EA/Recirc DEIR that implementation of the proposed mitigation measures would reduce adverse impacts to a less-than-significant level.[1]

3

To eliminate the significant adverse impact, we urge Metro to consider creative design options in the Final EIR that relocate or reengineer the station portal in order to retain the Atomic Café/Senor Fish Building in place. This may include temporarily relocating the building offsite or elsewhere onsite during construction, designing the station to maximize the vacant space around the building, or incorporating all or a significant portion of the existing building as an entryway to the underground station. While we recognize that saving the building presents some inherent challenges, in terms of the scope and intent of the proposed project, creative approaches could be further explored.

4

[1] Los Angeles County Metropolitan Transportation Authority, Regional Connector Transit Corridor, Supplemental Environmental Assessment/Recirculated Sections of the Draft Environmental Impact Report, July 22, 2011, Page 4.12-33. In order for adverse impacts to be less than significant, a proposed project would need to comply with the *Secretary of the Interior's Standards for Rehabilitation* or ensure the historic resource retains its eligibility for state or local landmark listing. See CEQA Guidelines, Section 15064.5.

In addition, in our experience, solely offering the Atomic Café/Senor Fish Building for relocation without an adequate receiving site secured and financial resources committed rarely results in a successful preservation outcome of the historic resource according to the *Secretary of the Interior's Standards for Rehabilitation* (the *Standards*). If relocation remains a mitigation measure, we urge Metro to actively seek an appropriate and feasible new site for the building and provide incentives such as the funds dedicated to demolition to defray the relocation expense. 5

The Conservancy appreciates Metro's offer to provide an exhibit commemorating the history and significance of the Atomic Café/Senor Fish Building but it should be noted that documentation and interpretative programming under CEQA does not meaningfully reduce the impacts of demolition of a historic resource.[2] We urge Metro to continue its engagement with the Little Tokyo community and work with them and the Japanese American National Museum in developing an interpretive program at the new station to tell the full and layered story of the Atomic Café and its role as a significant cultural landmark in Los Angeles. This may include incorporation of parts of the physical structure into the station if all efforts to rehabilitate or relocate the building are unsuccessful. It may also involve incorporating some new construction as well as retaining the existing building or portions therein. As an example, under Attachment A, we are including a project that blended old and new through a creative design approach that attempts to visually relay the important role and cultural significance of a historic resource. 6

II. Historic Resources Potentially Impacted by Vibration and Differential Settlement

The Supplemental EA/Recirc DEIR identified twelve California Register-eligible historic resources along the proposed route that could potentially be impacted by construction-related vibration; all except the Higgins Building also are eligible for the National Register of Historic Places.[3] Similarly, eight National Register and/or California Register-eligible properties could be potentially damaged by differential settlement due to tunneling and cut and cover construction.

The Conservancy appreciates the details and additional requirements for studies, surveys, monitoring, and contractor best practices near historic resources to avoid adverse impacts from ground-borne vibration and differential settlement. This is particularly important for the earliest buildings along the LPA route, especially the 1876 St. Vibiana Cathedral and the 1910 Higgins Buildings. As Metro's Memorandum of Agreement (MOA) with the California State Historic Preservation Officer (Appendix R-3) only applies to National Register-eligible resources, we recommend including the building protection measures of the MOA as additional mitigation measures in the Final EIR to apply to resources eligible for the California Register as well, such as the Higgins Building. In particular, the commitment from Metro to repair damages that occur during construction, as alluded to in the MOA, in a manner consistent with the *Standards* should be explicated stated in the Final EIR. 7

[2] "A large historical structure, once demolished, normally cannot be adequately replaced by reports and commemorative markers." *League for Protection of Oakland's Architectural and Historic Resources v. City of Oakland* (1997) 52 Cal.App.4th 896, 909.

[3] For complete list of the twelve locations, please see Supplement EA/Recirculated Draft EIR, p.4.12.36-38.

III. Los Angeles Zanja System

Although Section 4.12.2 Archeological Resource is not among the portions of the Draft EIR/EIR recirculated through the Supplemental EA/Recirc DEIR, it appears the route of the Locally Preferred Alternative potentially limits impacts to the Los Angeles zanja system to the segments that cross the LPA along First and Second Streets. The zanja system in Los Angeles was an extensive and integrated water conveyance network that served large areas of the city for many generations. Soon after founding of El Pueblo de la Reina de los Angeles in September 1781, the residents began construction of an extensive water management system to bring water from the Los Angeles River to the pueblo. This Zanja Madre, or mother ditch, in turn fed numerous smaller zanjas as the city grew and expanded. Over the decades, the zanja system supplied water for agriculture and ranching, as well as for domestic purposes, and was variously improved, covered, and piped until it fell out of use in the early 1900s. The Conservancy was actively involved with preservation efforts surrounding the 75-foot section of the Zanja Madre uncovered in the Los Angeles State Historic Park, also known as the Cornfields, in 2005 as part of the Gold Line construction.

8

According to the archeological technical report in the Regional Connector Draft EIS/EIR, many branches of the zanja likely remain within the project area. We look forward to the proactive and system-wide identification, documentation, and evaluation of the zanja system proposed as part of the mitigation measures in the Draft EIS/EIR. This will facilitate a better understanding of the current-day location of the various zanja branches, as well as ways to avoid adverse impacts from the construction of the Regional Connector. We also look forward to working with Metro and the project archeologists performing the onsite construction monitoring on appropriate preservation measures should segments of the zanja system be discovered as part of the proposed project.

Thank you for the opportunity to comment on the Regional Connector Transit Corridor Project Supplemental Environmental Assessment/Recirculated Draft EIR. Please feel free to contact me at (213) 430-4203 or afine@laconservancy.org or Flora Chou at fchou@laconservancy.org should you have any questions.

Sincerely,

Adrian Scott Fine

Attachment A

Modern Theatre, Boston

The Modern Theatre was built in 1876 to house two storefronts and furniture and carpet showrooms and storage. It was renovated in 1913 to accommodate a movie house, the first one in Boston, and did not originally contain a stage. From that point on, the building has been used for a variety of entertainment purposes, and as a performing arts center. The last attempt to restore the building was made in the late 1970's. The building has been vacant since the early 1980's and was in a state of severe neglect and disrepair.

Owner Suffolk University restored and reconstructed the grand building façade in 2010 as part of a $41 million development project that includes a new 185-seat theater and university housing in a 10-story residence hall built in a setback above the theater. One façade of the 10-story section displays names and dates in recognition of the rich history of the site and neighborhood.

While retaining only the façade of a building does not meet the *Secretary of the Interior's Standards for Rehabilitation*, and is not the ideal preservation solution, the approach at the Modern is an example of a creative way to recognize the complex and layered history of its site.

R-CN4

Responses to Comments from the Los Angeles Conservancy, Fine, Adrian Scott

Response to Comment R-CN4-1

Thank you for the information about the Los Angeles Conservancy. Responses to the Conservancy's previously submitted comments are provided in Volume F-2 of this Final EIS/EIR, numbered CN14-1 through CN14-5. Metro examined a full range of the potential build alternatives in the Alternatives Analysis Report completed in February 2009. The most feasible alternatives were carried forward into the Draft EIS/EIR, including the At-Grade Emphasis LRT Alternative, which would avoid the S. Kamada Restaurant, Atomic Café, Señor Fish, and Coast Imports building. However, this alternative would require the use of NRHP eligible historic resources, which is prohibited under Section 4(f) of the USDOT Act of 1966 when feasible and prudent avoidance alternatives, such as the Locally Preferred Alternative, exist. In consultation with the LA Conservancy, City of Los Angeles, and other stakeholders Metro has included additional mitigation measures, as shown in Section 4.12.1 of the Supplemental EA/Recirculated Draft EIR Sections, and Section 4.12.1.4.2 of this Final EIS/EIR, to address impacts to the building, including offering the building to any party willing to relocate it at their own expense, incorporating materials from the building into the station facilities, and providing an exhibit about the building to a local museum. These mitigation measures have been incorporated into Section 4.12.1.4.2 and the Mitigation Monitoring and Reporting Program (Chapter 8) of this Final EIS/EIR.

It should be noted that the historical uses of the building, such as the Atomic Café, have long been gone. The building now houses a Mexican restaurant that is unrelated to the historical uses. The architectural features of the building have been substantially altered, and offer little semblance of the historical uses. The fact that those former uses have an association with events linked to community history, which is the primary basis for why the building is considered historically significant, is best preserved through the recommended mitigation measures. The proposed mitigation measures would address the criteria that render the building historically significant because they would incorporate and enhance the story of the building's historic use into a museum exhibit and place interpretive materials on-site.

Response to Comment R-CN4-2

The Metro Board of Directors designated the Fully Underground LRT Alternative as the Locally Preferred Alternative on October 28, 2010. The Locally Preferred Alternative would require acquisition of the S. Kamada Restaurant, Atomic Café, Señor Fish, and Coast Imports building property, as analyzed in Section 4.12.1.3.5.2 of the Supplemental EA/Recirculated Draft EIR Sections. The CEQA impacts analysis is also provided in that section. As discussed in Section 4.12.1.3.5.2 of this Final EIS/EIR, implementation of the mitigation measures identified in Section 4.12.1.4.2 and the Mitigation and Monitoring Program for the Locally Preferred Alternative (Chapter 8) of this Final EIS/EIR would reduce impacts to the S. Kamada Restaurant, Atomic Café, Señor Fish, and Coast Imports building property to not adverse under NEPA and less than significant under CEQA. Thank you for the information about the building. Additional information about the building is provided in the cultural resources inventory in Appendix X, Cultural Resources - Built Environment, of the Draft EIS/EIR and Appendix X, Cultural Resources - Built Environment (Updated), of this Final EIS/EIR.

As noted on the survey form, the building was determined to be eligible for the California Register of Historic Resources (CRHR) under Criterion 1, but the structure has been significantly altered subsequent to its period of significance of 1965-1989. The historic signage present during the period of significance has been removed, the original windows have been removed and replaced, a corner entranceway has been filled in, and a side wall has been covered with a coating of gunnite. Nonetheless, the building was still determined to be eligible for the CRHR under Criterion 1.

Response to Comment R-CN4-3

Metro will continue to work with the Los Angeles Conservancy and other project stakeholders to ensure the implementation of the mitigation measures as they are currently proposed for the S. Kamada Restaurant, Atomic Café, Señor Fish, and Coast Imports building. As previously noted, Metro has explored a full range of feasible mitigation measures and alternatives to building removal. The mitigation measures (identified in Section 4.12.1.4.2 and the Mitigation Monitoring and Reporting Program (Chapter 8) of this Final EIS/EIR), when taken as a whole, provide all feasible mitigation and would reduce impacts to not adverse under NEPA and a less than significant level under CEQA. This includes offering the building for a price of one dollar to any party willing to move it off of the station site, incorporating materials from the building into project facilities, or keeping portions of the building intact for use in the 1st/Central Avenue station, as well as providing Historic American Buildings Survey/Historic American Engineering Record (HABS/HAER) recordation (for use during any potential relocation or for a permanent record of the building), and develop an exhibit commemorating the building at the Japanese American National Museum, the 1st/Central Avenue station site, or other suitable location.

Response to Comment R-CN4-4

Thank you for the suggestions provided in regards to developing creative design options for the 1st/Central Avenue Station and the potential integration of the Atomic Café into the new facility. Given the need to connect the Regional Connector alignment beneath 2nd Street to the proposed underground rail junction beneath 1st and Alameda Streets, it will not be possible to retain the S. Kamada Restaurant, Atomic Café, Señor Fish, and Coast Imports building in place. The necessity for a subsurface station at this location would preclude the ability to maintain the building (in its entirety) at its current location due to the construction methods and access needed to safely implement the Locally Preferred Alternative. Metro has included mitigation measures, as shown in Section 4.12.1 of the Supplemental EA/Recirculated Draft EIR Sections and Section 4.12.1.4.2 of this Final EIS/EIR, to address impacts to the building.

It should be noted that many of the options laid out in the commenter's suggestions will be explored by implementing the mitigation measures as they are currently proposed in Section 4.12.1 of the Supplemental EA/Recirculated Draft EIR Sections and this Final EIS/EIR. Metro will continue to work with the Los Angeles Conservancy and other project stakeholders to ensure that every effort is made to implement the mitigation measures.

Response to Comment R-CN4-5

Metro will work closely with the Los Angeles Conservancy and other project stakeholders to implement the mitigation measures for the S. Kamada Restaurant, Atomic Café, Señor Fish, and Coast Imports building.

Response to Comment R-CN4-6

Thank you for the information about the Modern Theater in Boston. The Draft EIS/EIR did include alternatives that avoided impacts to the S. Kamada Restaurant, Atomic Café, Señor Fish, and Coast Imports building property. However, the Locally Preferred Alternative identified in this Final EIS/EIR would require the acquisition of the S. Kamada Restaurant, Atomic Café, Señor Fish, and Coast Imports building property. The S. Kamada Restaurant, Atomic Café, Señor Fish, and Coast Imports building has been significantly altered from its original condition and does not meet the criteria for architectural historic significance (Criterion 3) or association with persons significant to our past (Criterion 2). However, this location played an important role in the broad patterns of California history as the commenter points out. Metro agrees that mitigation is required for the change to the property. Metro also agrees that additional mitigation measures are warranted to mitigate for the impacts to this historic resource and that the proposed additional mitigation, while not required to reach the CEQA determination in the Draft EIS/EIR, would reinforce that determination. Metro has developed additional mitigation measures to enhance reduction of the impacts to not adverse under NEPA and a less than significant level under CEQA and to be responsive to these comments. These include Metro offering the building for a period of one year following certification of this Final EIS/EIR for the price of one dollar to any party willing to move the building off of the 1st/Central Avenue station site at their own expense. Should no parties come forward, Metro would incorporate materials from the building into the project facilities. Metro would also offer to provide an exhibit commemorating the Atomic Café at the Japanese American National Museum or other suitable location, including exploring incorporating such an exhibit into the proposed 1st/Central Avenue station; and developing an individual HABS/HAER submission. Section 4.12, Historic Resources, of this Final EIS/EIR and the Mitigation Monitoring and Reporting Program for the Locally Preferred Alternative (Chapter 8) have been updated accordingly with the new mitigation measures.

Response to Comment R-CN4-7

The St. Vibiana Cathedral, the Higgins Building, and other historic resources along the proposed Locally Preferred Alternative alignment are analyzed in Section 4.12.1 of the Supplemental EA/Recirculated Draft EIR Sections and this Final EIS/EIR. Building protection measures are included for resources not eligible for the NRHP in Section 4.12.1.4 of the Supplemental EA/Recirculated Draft EIR Sections. These mitigation measures have been incorporated into Section 4.12.1.4.2 and the Mitigation Monitoring and Reporting Program (Chapter 8) of this Final EIS/EIR. No damage to historic structures is anticipated. However, Metro would repair any damage caused by construction by restoring the building to its pre-construction survey condition, as discussed in Section 4.7.3.5.1 of the Draft EIS/EIR, Supplemental EA/Recirculated Draft EIR Sections, and this Final EIS/EIR. This mitigation measure was included in Section 4.7.4.1 of the Draft EIS/EIR and Supplemental EA/Recirculated Draft EIR Sections, Section 4.7.4.2.1 of this Final EIS/EIR, and is included as mitigation measure number NV-1 of the Mitigation Monitoring and Reporting Program (Chapter 8 of this Final EIS/EIR).

Response to Comment R-CN4-8

Comment acknowledged. Metro looks forward to working with the Los Angeles Conservancy as the mitigation measures are implemented for the Los Angeles Zanja System as noted in Section 4.12.2.4.2 of the Draft EIS/EIR and this Final EIS/EIR (CR/A-6).

Subject: Question Regarding Car Storage For R/C

R-PC1

Dear Regional Connector Team,

I could really use your help in figuring something out. In looking over the map for the R/C something seems apparent that doesn't seem to have been considered:

The new tunnel for the Regional Connector project will intersect the isolated portion of the old Pacific Electric "Hollywood Subway" tunnel. It is large enough to be used as a storage area for trains. Holding at least two, but potentially as many as eight or more three car trains.

The land could be had cheaply, is almost a mile long, was built for this purpose and is wide enough for two tracks which split out to *four* platforms. It could also be accessed from the subway terminal building by operators starting or leaving shifts.

1

Do you know if anyone had considered this option? It seems like money laying on the table.

Thanks much for your time!

F4-216
Alex Kasperavicius

P.S. You can see a picture of the inside of the tunnel here (http://www.flickr.com/photos/7294653@N07/2816704344/)

R-PC1

Responses to Comments from Kasperavicius, Alexis

Response to Comment R-PC1-1

The abandoned Pacific Electric (Belmont) tunnel crosses the proposed Locally Preferred Alternative alignment near 4th and Flower Streets, and was partially demolished in this location during construction of the Bonaventure Hotel. Due to the depth of the proposed Regional Connector tunnel, which is confined by engineering and utility constraints, an additional section of the Pacific Electric tunnel would need to be removed during construction as indicated in Section 4.12.1 of the Draft EIS/EIR and the Supplemental EA/Recirculated Draft EIR Sections and this Final EIS/EIR. The Regional Connector tracks would not be level with the Pacific Electric tunnel in this location, making a connection difficult. The Subway Terminal Building is privately-owned, and it is Metro's goal to minimize the use of private property as requested by comments received during scoping and the Draft EIS/EIR review period. Therefore, Metro is not pursuing a connection to the Pacific Electric tunnel as part of the Regional Connector project.

R-PC2

Hellow,

I am writing as a stackholder to tell you that I support he Regional Connector as layed out in the Final EIS/EIR 100%. This is the most important rail line for the future of Los Angeles, connecting the Gold, Blue and future Expo Line seamlesly through 7th/Metro. I use tat station often and look forward to the completion of the connector. I hope that the US Goverment decides to fund this project and I am happy that the work has been done so completely on this to this point. 1

While it would be nice to have a station in Buner Hill and FInancial District, I support the line without it as well.

Thank you

Eric Tooley

Subject: Regional Connector

Dear Ms. Roybal Saltarelli,

First of all, the route chosen for the regional connector, as well as the decision to go underground, makes perfectly good sense--no surface route would have worked from either a speed or capacity standpoint. 1

What I do find troubling--and I realize this is not a new concern--is lack of a station at the heart of the financial district: 4th/5th and Flower. My chief concern is not a lessening of convenience for office workers in that vicinity: walking a couple of extra blocks would do us all good. Crowding at the 7th/Metro platforms is the real concern. Already those platforms can be uncomfortably crowded at rush hours, and adding the Expo Line traffic will only intensify the problem. 2

If monetary considerations won't allow for a Financial District station during initial construction, it would be extremely shortsighted not to construct the line in such a way that a station can be added in the future--it will surely be needed. 2 cont'd

Thank you for the opportunity to comment, and good luck as you move ahead with the excellent plan for a regional connector that promises to tie the entire light-rail system together in a rational way. 3

Jim Norton

R-PC3

Responses to Comments from Norton, Jim

Response to Comment R-PC3-1

Comment noted. The Locally Preferred Alternative alignment would be underground.

Response to Comment R-PC3-2

Due to a need to reduce project cost, the Locally Preferred Alternative designated by the Metro Board of Directors on October 28, 2010 does not include a station at 5th and Flower Streets. However, the Locally Preferred Alternative would be designed so as not to preclude a station from being added at this location as a separate future project. Ridership at 7th Street/Metro Center Station will be affected by a number of new developments in the area. As shown in Section 4.19.2.3 of this Final EIS/EIR, the separate Flower Street Fire/Life/Safety Project would address Fire/Life/Safety concerns at 7th Street/Metro Center Station. However the Regional Connector project is a separate project that, by itself, would not result in crowding at unsafe levels regardless of whether a station is built at 5th and Flower Streets.

Response to Comment R-PC3-3

Thank you for your comment.

Subject: Comments to Metro Regional Connector Recirculation Draft EIR/EIS due 9.6.2011

Comments to Metro Regional Connector Recirculation Draft EIR/EIS due 9.6.2011

Methane and mitigation standards and a Methane Prevention Detection and Monitoring Program (with the National Fire Protection Association standards) need to be taken into account as well as the City of Los Angeles Methane Task Force. 1

The Methane Task Force does not seem to meet and therefore may be inconsequential to mitigation of methane. An alternative needs to be decided. 2

Subsidence matters need to be taken into consideration. 3

Earthquake faults were not mentioned in this recirculation or mitigation factors. 4

Mangrove Estates property was a former oil field. This and any other site should be recognized for safety factors. 5

Methane migration would change any projected usage in the Greenhouse Gas Emissions. 6

The use of overweight trucks was not mentioned, nor any sewer breakage by their use. Who will be responsible, the private property owner? 7

No mention of stormwater projects including City of Los Angeles Proposition O projects or any State watershed projects including but not limited to State grants was not mentioned and its effect. 8

Water supply issues were not addressed and there appears to be no Water Supply Assessment. There lacks any mention of restroom placement and drinking water. 9

Noise and vibration was not measured during time of days of usage such as the Disney Center concert schedule. 10

What scientific data will be collected, who will analyze that data and who will report that data. 11

Who is responsible for any liability and with what securitization? 12

Joyce Dillard
P.O. Box 31377
Los Angeles, CA 90031

R-PC4

Responses to Comments from Dillard, Joyce

Response to Comment R-PC4-1

Analysis of the potential to encounter methane in the project area was analyzed in Section 4.9.3.5.2 of the Draft EIS/EIR and this Final EIS/EIR, and mitigation measures were proposed in Section 4.9.4. These mitigation measures have been incorporated into Section 4.9.4.2 and the Mitigation Monitoring and Reporting Program for the Locally Preferred Alternative (Chapter 8) of this Final EIS/EIR. The Regional Connector project would be consistent with the City of Los Angeles Methane Mitigation Standards. Also, all project structures within methane zones and buffer zones would be consistent with municipal code requirements for gas concentration/pressure testing on a specified frequency and, based on the results, appropriate mitigation measures or controls to be included in the design. These measures would include the use of gas-impermeable liners and venting to reduce or eliminate gas intrusion into stations and along the length of the underground segments as needed to ensure consistency. Mitigation ensuring compliance with all applicable fire and methane standards and regulations is included as mitigation measure numbers SS-1 through SS-5 in the Mitigation Monitoring and Reporting Program for the Locally Preferred Alternative (Chapter 8 of this Final EIS/EIR).

Response to Comment R-PC4-2

Adequate analysis and mitigation of methane was performed and included in the Draft EIS/EIR, as described in Response to Comment R-PC4-1 above. Metro would implement the mitigation measures identified in Sections 4.9.4.2 and 4.15.4.2 and the Mitigation Monitoring and Reporting Program for the Locally Preferred Alternative (Chapter 8) of this Final EIS/EIR to ensure no adverse/significant methane risks occur, irrespective of Methane Task Force meetings.

Response to Comment R-PC4-3

Impacts associated with subsidence have been analyzed in Section 4.9, Geotechnical/Subsurface/Seismic/Hazardous Materials, of the Draft EIS/EIR and this Final EIS/EIR. As indicated in Section 4.9, the proposed tunneling would have the potential for adverse impacts related to ground settlement and differential settlement immediately above the alignment as well as adjacent to structures including the historical buildings. Mitigation measures were identified in the Draft EIS/EIR and have been refined in this Final EIS/EIR, which would reduce impacts associated with potential ground settlement to not adverse under NEPA and less than significant under CEQA.

Response to Comment R-PC4-4

Earthquake faults were discussed in Section 4.9.2.2 of the Draft EIS/EIR and this Final EIS/EIR. As indicated in the section, the project area is not located within a currently established Alquist-Priolo earthquake fault zone for surface fault rupture. A detailed inventory of regional fault zones is available in Appendix U, Geotechnical/Subsurface/Seismic/Hazardous Materials Technical Memorandum.

Response to Comment R-PC4-5

The Union Station Oil Field along Los Angeles and Temple Streets has been delineated as a Methane Zone by the City of Los Angeles Department of Public Works, Bureau of Engineering. The area of the Union Oil Methane Zone, which includes the Mangrove property, is illustrated in Figure 4.9-3 of the Draft EIS/EIR and this Final EIS/EIR. Hazardous impacts associated with this methane zone have been discussed in Section 4.9, Geotechnical/Subsurface/Seismic/ Hazardous Materials, of the Draft EIS/EIR and this Final EIS/EIR.

Response to Comment R-PC4-6

The comment is unclear. Hazardous impacts associated with methane zones and methane buffer zones have been discussed in Section 4.9, Geotechnical/Subsurface/Seismic/Hazardous Materials, of the Draft EIS/EIR and this Final EIS/EIR. Greenhouse gas emissions were discussed in Section 4.6, Climate Change, of the Draft EIS/EIR and this Final EIS/EIR.

Response to Comment R-PC4-7

The potential for haul trucks to physically damage roadways was discussed in Chapter 3, Transportation Impacts and Mitigation, of the Draft and Final EIS/EIR. Mitigation was incorporated which required that roadways be restored to pre-construction condition if damaged by project-related traffic (see mitigation measure number TR-2 in the Mitigation Monitoring and Reporting Program for the Locally Preferred Alternative (Chapter 8 of this Final EIS/EIR)). The construction contractor would be responsible for repairing roadways damaged due to project-related traffic during construction. The weight of loaded haul trucks would not be heavy enough to damage sewer lines.

Response to Comment R-PC4-8

No City of Los Angeles Proposition O or state watershed projects are located in the Regional Connector project area. As indicated in Section 4.10, Water Resources, of the Draft EIS/EIR and this Final EIS/EIR, the Regional Connector would have no adverse effects and no significant impacts on drainage or hydrology.

Response to Comment R-PC4-9

No public restrooms or drinking fountains would be provided as part of this project. Restrooms for Metro staff would be located at each station. The water supply required for private restroom facilities and fire flow needs would be minimal and adequate water supply would be available to serve the project from existing entitlements and resources, and no new water facilities or the expansion of existing facilities would be required. The Regional Connector project does not meet the definition of a "project" requiring of preparation of a Water Supply Assessment.

Response to Comment R-PC4-10

In order to obtain conservative ambient noise measurements, noise monitoring was conducted when Walt Disney Concert Hall facilities were not in use, which resulted in lower ambient noise levels. In addition, noise monitoring was conducted to minimize disruption with operations and activities at the Walt Disney Concert Hall.

Response to Comment R-PC4-11

The scientific data that was collected as part of this environmental analysis is presented in Volumes F-1, F-5, and F-6 of this Final EIS/EIR. Refer to Appendix C, List of Preparers (Updated), of this Final EIS/EIR for the list of staff who prepared the Draft EIS/EIR, Supplemental EA/Recirculated Draft EIR Sections, and this Final EIS/EIR.

Response to Comment R-PC4-12

It is unclear what liability the commenter is referring to. Liability varies depending on the circumstance. The EIS/EIR has been prepared in accordance with National Environmental Policy Act regulations and California Environmental Quality Act guidelines. Federal Transit Administration is the lead agency under NEPA and the Los Angeles County Metropolitan Transportation Authority (Metro) is the lead agency under CEQA.

Phone Number	(323) 663-5900
Select a Subject *	I have a suggestion

Comment *

I have a comment on the Supplemental Environmental Assessment/Recirculated Sections of the Draft Environmental Impact Report (Supplemental EA/Recirculated Draft EIR Sections) presenting information on the refinements to the Locally Preferred Alternative (LPA) for the Regional Connector.

I have one primary concern regarding the Regional Connector project, and it is about the proposed station at 1st and Alameda. It is my understanding that in order to build this station, three historic structures – and the successful businesses they house – must be razed. The businesses are Señor Fish, Weiland's Brewery, and The Spice Table. 1st st in Little Tokyo is one of the very few historic streets in Los Angeles that has kept the majority of its buildings

1

intact - this continuity has contibuted to a well-frequented pedestrian friendly streetscape.

I would like to encourage the Regional Connector planners to carefully consider how the proposed station will impact the intersection, particularly in regards to scale. The sense of place is already present. A station area consisting of oversized sculptural gestures in a vast plaza would be a step backwards. Perhaps at least the historic facade of the Señor Fish building could be preserved, in a similar manner as was done for facades on Vine Street, Hollywood when the massive "W" Hotel project was constructed.

From an urban planning perspective, it is unfortunate that the original plan - to replace the Office Depota property with the station - was found to be unsuitable. The Office Depot and its parking lot are at a surburban scale, and very out of character with the neighborhood. The focal point that a station would have contributed to that part of the neighborhood could have helped to tie together the gateways to the Artist District and Little Tokyo.

1
cont'd

R-PC5

Responses to Comments from Kay, Gregory

Response to Comment R-PC5-1

Of the three structures mentioned, only the S. Kamada Restaurant, Atomic Café, Señor Fish, and Coast Imports building is eligible for the California Register of Historic Resources, and none are eligible for the National Register of Historic Places. Metro understands the value of these buildings, and the importance of small businesses to the Little Tokyo community. It is Metro's goal to minimize the number of business acquisitions needed for the project. Refinements made to the Locally Preferred Alternative since publication of the Draft EIS/EIR have reduced the number of businesses displaced on the block bounded by 1st Street, Alameda Street, 2nd Street, and Central Avenue, as shown in Table 4.2-5 and Appendix R-1, Locally Preferred Alternative Drawings, of the Supplemental EA/Recirculated Draft EIR Sections and Table 4.2-5 and Appendix 1, Locally Preferred Alternative Drawings, of this Final EIS/EIR. No historic resources in the Little Tokyo Historic District would be affected. In mitigation measure number CN-8 in the Mitigation Monitoring and Reporting Program for the Locally Preferred Alternative (Chapter 8 of this Final EIS/EIR), Metro indicates that the design of the 1st/Central Avenue station would enhance pedestrian circulation, thus contributing to the pedestrian-friendliness of the streetscape. A visual and aesthetic analysis of the Locally Preferred Alternative was performed and documented in Section 4.4.3.5 of the Draft EIS/EIR and this Final EIS/EIR. Station design features would be developed in conjunction with the community. As indicated in Section 4.12.1 of the Supplemental EA/Recirculated Draft EIR Sections and mitigation measure number CR/B-5 in the Mitigation Monitoring and Reporting Program for the Locally Preferred Alternative (Chapter 8 of this Final EIS/EIR), would be offered for a period of one year following certification of this Final EIS/EIR for the price of one dollar to any party willing to move it off of the 1st/Central Avenue station site at their own expense. Should no parties come forward, Metro would incorporate materials from the building into the project facilities. Metro would explore keeping portions of the building intact for use in the 1st/Central Avenue station. The 1st/Central Avenue station would be adjacent to the Office Depot store, and would still be able to function as a focal point for both Little Tokyo and the Arts District.

From: Alex Braunstein [mailto:legandaryedition@gmail.com]
Sent: Friday, September 02, 2011 5:05 PM
To: Regional Connector
Subject:

I have read most of the EIR for the regional connector. It looks, for the most part, like a good system, with a few exceptions. The most glaring is the odd placement of portals. There are times when there are three portals places on the same side of the same block. Three portals are good, but when they are adjacent to each other, they are pointless. Instead, I would like suggest placing them across the street from each other, as the portals are in cities such as New York, London, and Paris. Besides that, there is not much more to say. It looks like a good extension, especially the part about grade-separating the Gold Line.

1

2

R-PC6

Responses to Comments from Braunstein, Alex

Response to Comment R-PC6-1

It appears that the term "portals" refers to station entrances in this comment. Not all station entrances shown in Appendix R-1, Locally Preferred Alternative Drawings, of the Supplemental EA/Recirculated Draft EIR Sections would ultimately be built, as discussed in Section 2.3.6.2 of this Final EIS/EIR. Entrance locations would be confirmed during final design. Preference for having entrances across the street from each other is noted.

Response to Comment R-PC6-2

Support for the project and grade separation of the Metro Gold Line is noted.

To: Regional Connector
Subject: Supplemental EA/Recirculated Draft EIR Sections Available for Public Review

I am still disappointed that there is no discussion or comments about connections to any lines heading south from Union Station/Alameda street area. These could be to the Blue Line, the Harbor Sub to LAX and the Santa Ana Branch corridor- a line that will desperately need a connection to Union Station/Downtown to be a success. Still feel you need a knock out panel near Central to allow a future line to the south. 1

This is a typical problem with METRO have individual teams doing individual lines, no one talks or communicates about connections or junctions with the other proposed lines. Good example is having to redo 1st/Alameda from the East LA just to make the downtown connector work.

other than the deleated station in the financial district, the rest of the project being underground and spacing of the stations is good. 2

thank you

Responses to Comments from Johnston, Mark R.

Response to Comment R-PC7-1

Connections southward along Alameda Street toward the Metro Blue Line, Harbor Subdivision, or the Santa Ana Branch corridor are outside the scope of this project, and would not meet the purpose and need goal of minimizing trip times between the Metro Gold, Blue, and Expo Lines at Union Station and 7th Street/Metro Center Station as stated in Section 1.2.2 of the Draft EIS/EIR and this Final EIS/EIR. The Harbor Subdivision Alternatives Analysis Report prepared in 2009 examined the possibility of an Alameda Street alignment. Metro ensures coordination and consistency between its corridor projects. The At-Grade Emphasis LRT Alternative and Underground Emphasis LRT Alternative would have preserved the existing Little Tokyo/Arts District station and much of the surface trackwork around the 1st and Alameda Streets intersection. However, the Metro Board of Directors designated the Fully Underground LRT Alternative as the Locally Preferred Alternative on October 28, 2010 because it would result in fewer impacts to the Little Tokyo community than the other build alternatives and it would successfully serve the project purpose and need.

Response to Comment R-PC7-2

Opposition to the deletion of the Flower/5th/4th Street station is noted. The Locally Preferred Alternative would be constructed in a way that does not preclude addition of a Flower/5th/4th Street station at a later time as a separate future project. Support for the spacing between station and the underground alignment is noted.

September 2, 2011

Dolores Roybal Saltarelli, AICP, Project Manager
One Gateway Plaza, MS 99-22-2
Los Angeles, CA, 90012

Dear Ms. Roybal Saltarelli,

This is a comment for the Supplemental Environmental Assessment/Recirculated Sections of the Draft Environmenta' Impact Report for the Regional Connector Transit Corridor Study. During the over-half century that I've lived my whole life here in Los Angeles, I haven't simply been a deeply intent fan of railroads in southern California, I've done thousands of hours of research and on site investigation. I'm the Huntington Library manuscript volunteer who works on railroad maps. I'm one of the rapidly disappearing few who made sure to ride local rail transit before its final fragments were totally erased county-wide on March 31, 1963. Few people have the knowledge in local railroads that I have. Because of extensive, long time interest, the proposed Regional Connector strikes me as one of the most badly needed projects that have ever been proposed.

The key message here is mandate that Measure R sent on November 2008. Ballot initiatives almost never pass with two thirds vote. Measure R did. Though figures vary, whether 2,039,214 votes (67.93%), or 67.22%, or other precise total is used, it's still clear that passage of Measure R was a truly rare event, a pointed and emphatic message that the majority of us need and want require relief from the increasing transportation gridlock we suffer. That's how deep our dissatisfaction is with our transit system, how much more we want it expanded and improved. It would be tough to claim that either the Westside Subway extension of the Purple Line or the Regional Connector trumps the other in being beneficial or overdue, that's a difficult choice. But we reject further single passenger automobile solutions that have gotten us in such a widespread predicament. Because of the signal value of the Regional Connector, I hope the Draft and Final Environmental Impact Reports are approved and construction expedited as soon as possible, we need it. 1

Unfortunately and even at this advanced date, the Regional Connector doesn't get the share of attention it deserves. Though the Regional Connector project some powerful people who advocate it, California Senator Barbara Boxer and Los Angeles Mayor Antonio Villaraigosa not being the least, I have to stress that insufficient attention is focused on the value and necessity of Connector, how it removes the critical gap that's prompted it, how it would take what is currently somewhat a patchwork of transit in one of the greatest cities on the planet and make that transit system far more useful.

This greatly refined Regional Connector is truly superb now, with its elegant alignment that now tunnels under Japanese Village Plaza. Besides simply

being "done right" it will make an overdue and welcome change to thousands of us, not only in saving time and making a daily impact in quality of life to those who need to use it but in the resulting gridlock it will relieve from the rest of us. This project has had some of the most demanding changes and stresses locally that such projects ever suffer. No small amount of work has been done by th e Connector staff to be hospitable and compliant with the wishes of the historic, valued Little Tokyo community that was concerned about the damage to them from at-grade crossings. The Little Tokyo Community Council understandably gave approval to the the good work doen revising the project, particularly the changed alignment under Japanese Village, proceeding with the underground-only alternative, and use of the Mangrove property to markedly reduce the impact of construction on the tiny, fragile and beloved Little Tokyo in downtown Los Angeles. By having so many different factions nearly unaminously stress the need and desire for the Regional Connector, I hope that Metro responds to the voice and wishes of the people to make every effort to have it in operation as soon as safely and competently possible.

1
cont'd

Sincerely,

Dave Frevele

Responses to Comments from Frevele, Dave

Response to Comment R-PC8-1

Thank you for your comment. Experience with railroads and support for the Regional Connector project is noted. Support for the Locally Preferred Alternative and refinements made since publication of the Draft EIS/EIR is noted. It is Metro's goal to complete the Regional Connector project in a safe and timely manner.

1.0 SUMMARY

This technical memorandum analyzes whether construction and operation of the proposed Regional Connector Transit Corridor project would result in potential adverse (National Environmental Policy Act [NEPA]) and significant (California Environmental Quality Act [CEQA]) short-term, long-term, and cumulative impacts on local parklands and community facilities. The analysis addresses potential direct and indirect impacts based on proposed acquisitions and potential effects on access.

Existing parklands and community facilities are located within 0.25 miles of the proposed Regional Connector Transit Corridor project alignments, stations, and construction sites. After cataloging the parklands and community facilities in close proximity to the proposed project, including those facilities found to be potential Section 4(f) resources, it was determined that the impacts to these facilities are less than significant (not adverse) for all alternatives and no mitigation is required.

2.0 INTRODUCTION

Transit improvements typically can enhance accessibility to parklands and community facilities, particularly for those individuals who are transit dependent. However, physical features associated with construction and operation of the transit improvements can also have direct and indirect adverse effects by acquisition of physical property, disruption to parkland users and other community facilities and their associated services, and changes to roadways and public right-of-ways that reduce pedestrian or vehicular access to facilities.

This technical memorandum identifies existing and potentially affected parklands and community facilities along and/or within 0.25 miles of either side of proposed project alignments, stations, and sites associated with construction activities. Parklands include public parks and outdoor recreational facilities, but do not include private plazas or private building-related open space. Community facilities include police and fire services, libraries, educational facilities (including day cares), churches, cemeteries, hospitals, and convalescent homes.

3.0 METHODOLOGY FOR IMPACT EVALUATION

3.1 Regulatory Framework

The following sections describe the regulatory framework used to guide parkland and community facility development by applicable jurisdictions in the project area, as well as determine adverse and significant impacts.

3.1.1 Federal

3.1.1.1 Parklands and Schools

Section 4(f) of the United States Department of Transportation (USDOT) Act of 1966 (re-codified as amended at 49 United States Code [USC] Section 303) affords special protection to public recreational lands and facilities, including local parks and school facilities, that are open and available to the general public for recreational purposes, significant cultural resources, and natural wildlife refuges. Federally funded transportation improvement projects are prohibited from encroachment (direct impacts, constructive use, or a taking) on Section 4(f) lands unless it can be demonstrated that no other alternative exists. Parks and recreational Section 4(f) lands within or adjacent to the proposed corridor are discussed in Section 4. The Historic, Archaeological and Paleontological Resources Technical Memorandum discusses Section 4(f) as it relates to historical resources.

Since 1966, Section 4(f) has undergone several changes. In August 2005, Section 6009(a) of the Safe, Accountable, Flexible, Efficient Transportation Act – A Legacy for Users (SAFETEA-LU) made the first substantive revision to Section 4(f) since the 1966 USDOT Act. Section 6009, which amended existing Section 4(f) legislation at both Title 49 USC Section 303 and Title 23 USC Section 138, simplified the process and approval of projects that would have only *de minimis* impacts on lands impacted by Section 4(f). Under the new provisions, once the Federal Transit Administration (FTA) determines that a transportation use of Section 4(f) property results in a *de minimis* impact, analysis of avoidance alternatives is not required and the Section 4(f) evaluation process is complete.

3.1.1.2 Fire Services

The Uniform Fire Code (UFC) contains regulations relating to building construction and maintenance and the use of their premises. Topics addressed in the UFC include fire department access, fire hydrants, automatic sprinkler systems, fire alarm systems, fire and explosion hazards safety, and hazardous materials storage and use. The regulations also include provisions intended to protect and assist fire responders, industrial processes, and many other general and specialized fire safety requirements for new and existing buildings and their premises. The UFC contains specialized technical regulations related to fire and human safety.

3.1.2 State

3.1.2.1 Fire Services

California Code of Regulations (CCR) Title 24 of the California Building Code (CBC) is a compilation of building standards. State fire regulations are set forth in Section 13000 et seq. of the California Health and Safety Code and include regulations for building standards (as also set forth in the CBC), fire protection and notification systems, fire protection devices such as extinguishers and smoke alarms, high-rise building and childcare facility standards, and fire suppression training. If there is no local fire authority and in state-owned and state-occupied facilities, the California State Fire Marshall has full enforcement jurisdiction of state fire regulations.

3.1.2.2 Educational Facilities:

Each of the state school districts is subject to the regulations of the California Education Code (CEC) and the governance of the California State Board of Education, relative to funding, school curriculum, operations, and facilities (including location considerations).

3.1.3 Local

Parklands, public services (i.e., police and fire protection), libraries, and other community facilities (i.e., educational facilities) are generally regulated by local agencies. Therefore, these components and implementation of the proposed project alternatives would be regulated primarily by agencies and policies of Los Angeles County and the City of Los Angeles.

In addition, public schools within 0.25 miles of either side of the proposed project alignments, stations, and maintenance and operations facility sites are within the Los Angeles Unified School District (LAUSD), which has its own policies and procedures. Specific policies pertaining to other community facilities are implemented through land use and zoning, and are described in more detail in the Land Use and Development Technical Memorandum.

The following sections summarize many of the applicable local policies, listed by jurisdiction:

3.1.3.1 Los Angeles County

Parklands and community facilities are subject to the guidelines set forth in the Los Angeles County General Plan. The County's General Plan has policies that affect park and recreation facilities and police and fire services in the project area, including the following:

- *Parks and Recreation*: Policy C/OS 1.1 promotes acquisition and preservation of open space areas throughout the County.
- *Police Services*: Policy PS 8.1 promotes phased development, whereby land use proposals are developed in conjunction with approved law enforcement capabilities.

- *Fire Services*: The Los Angeles County Fire Code and General Plan establish standards, policies, and goals for fire suppression facilities within the County. In addition, the County's General Plan includes policies (such as Policy PS 7.1) that promote phased development, whereby land use proposals are developed in conjunction with approved fire protection capabilities.

3.1.3.2 City of Los Angeles

Citywide Level

Parks and Recreation: Recreational planning is accomplished through various land use plans, including the City of Los Angeles General Plan and various community plans, specific plans, and recreational use plans developed by the City of Los Angeles Department of Recreation and Parks.

According to the City of Los Angeles Public Recreation Plan, a satisfactory recreation system must measure up to accepted standards in three respects. The first standard is sufficient land area must be set aside for recreation; the second is recreation areas must be properly distributed in residential areas throughout the City; and third, facilities must meet different recreation needs, including both active and passive recreation and provisions for every age (City of Los Angeles 1980).

Police Services: While there are no specific local or regional plans that address police services, the City's General Plan framework and specific community plans contain policies and objectives that ensure adequate police service infrastructure for the Los Angeles Police Department (LAPD).

Fire Services: The City of Los Angeles both surrounds and adjoins other cities, counties, and state and federally controlled lands; therefore, it has joined a variety of mutual aid agreements with other jurisdictions for the cooperative response and management of fires and other emergency incidents. The Los Angeles Fire Department (LAFD) participates in automatic response agreements with the County. The City's General Plan and Fire Code (part of the City's municipal code) contain the goals, objectives, and policies related to fire prevention and suppression services.

Community Level

The project area crosses two designated City of Los Angeles communities: Central City and Central City North. Both of these communities have community plans that contain applicable policies regarding existing parklands and community facilities. These policies are discussed in the following sections.

Central City Community Plan

Central City is a community within the City of Los Angeles located south of Sunset Boulevard/Cesar Chavez Avenue, north of the Santa Monica Freeway (I-10), east of the Harbor Freeway (I-110), and west of Alameda Street. The following paragraphs summarize applicable Central City Community Plan policies, listed by community facility type.

Parks and Recreation: Policy 4-1.1 seeks to expand the range of potential open space resources at the neighborhood and community levels. Policy 4-2.1 fosters physical and visual links between open spaces and public spaces in downtown Los Angeles with the implementation of the Civic Center Shared Facilities and Enhancement Plan and Metro's Angel's Walk Pedestrian Master Plan. Increased use of existing parks and recreational spaces is encouraged with Policy 4-3.1. Policy 4-4.1 supports improvement of Central City's pedestrian environment in recognition of its important role in the efficiency of the downtown's transportation and circulation systems. This policy also promotes improvement of the quality of life for its residents, workers and visitors.

Police Services: Policy 5-1.1 requires consultation with the LAPD during review of development projects and land use changes to determine law enforcement needs and requirements. This policy also requires decision-makers for proposed projects to include findings relevant to impacts to police service demand

Fire Services: Policy 6-1.1 requires coordination with the LAFD during review of significant development projects to determine the impacts on fire service demand. This policy requires decision-makers for proposed development projects to include findings regarding potential impacts to fire service demand and encourages continued consultation with the LAFD.

Libraries: Policy 8-1.1 encourages flexibility in locating libraries in mixed-use projects, pedestrian-oriented areas, transit-oriented districts, and similar areas.

Educational Facilities: Policy 7-1.1 encourages the location and design of school locations to be compatible with the surrounding neighborhood and to use schools to create a logical buffer between different land uses. It also requires that decision-makers be involved in review of proposed schools and adopt findings that support the application of this objective. Policy 7-1.2 encourages changes to the planning and building code to allow reuse of existing buildings for educational purposes.

Central City North Community Plan

Central City North is a community within the City of Los Angeles adjacent to downtown Los Angeles. The community is bounded by the Los Angeles River on the east; the City of Vernon to the south; Alameda Street, Cesar Chavez Avenue, Sunset Boulevard, and Marview Avenue to the west; and Stadium Way, Lilac Terrace, and North Broadway to the north. The following

paragraphs summarize applicable Central City North Community Plan policies, listed by community facility type:

Parks and Recreation: Policy 4-1.1 seeks to protect and preserve recreational facilities and park space by designating city recreation and park facilities as open space. Policy 5-1.1 encourages retention of passive and visual open space to provide a balance to the urban development of the Plan area. Policy 5-2.1 promotes accessibility, security, and safety of park users, especially families with children and senior citizens, by park design, construction, and maintenance methods.

Police Services: Policy 8-1.1 requires consultation with the LAPD during review of significant development projects to determine potential impacts on police service demand. Decision-makers are required to include findings considering potential impacts of a proposed project on police service demands.

Fire Services: Policy 9-1.1 requires coordination with the LAFD during review of significant development projects to determine the potential impact on fire service demands. This policy requires decision-makers to include findings regarding potential impacts on fire service demands of a proposed project.

Libraries: Policy 7-1.1 encourages flexibility in locating libraries in mixed-use projects, shopping malls, pedestrian-oriented areas, transit stations, office buildings, and other similar areas.

Educational Facilities: Policy 6-1.1 encourages the development and design of school locations to be compatible with the surrounding land uses and community character, and to use schools as a logical transition and buffer between different land uses.

3.2 Standards of Significance

3.2.1 NEPA and Section 4(f)

NEPA does not have specific requirements related to potential impacts on parklands and community facilities. However, Section 4(f) of the USDOT Act of 1966 requires protection of certain parklands and community facilities, as specified in the regulation. Section 4(f) properties are considered significant if they play an important role in meeting community objectives in terms of availability and functions of recreation, park, or wildlife and waterfowl.

Only selected levels of significance are relevant to this project because not all of the resources described in the guidance are present in the urban-built environment of downtown Los Angeles. Significance is determined by consultation with local, state, or federal agencies with jurisdiction over the resources. Therefore, a significant adverse impact to Section 4(f) properties would occur if an alternative would require:

- Direct use of Section 4(f) lands (physical acquisition, displacement or relocation)
- Constructive use (indirect effect) of Section 4(f) lands by which a project's proximity to the Section 4(f) resources substantially impairs the normal use of the land (i.e., altering access, introducing significant noise or vibration, casting shadows, or other substantive changes to the visual setting)

3.2.2 CEQA

CEQA thresholds for parklands are identified in Section K of the *L.A. CEQA Thresholds Guide* (City of Los Angeles 2006). In accordance with CEQA, a project would normally have a significant impact on parklands if it could:

- Result in substantial adverse physical impacts from new or physically altered government facilities, need for new or physically altered government facilities, and construction that could cause significant environmental impacts to maintaining acceptable service ratios, response times, or other performance objectives for parks.
- Increase the use of existing neighborhood and regional parks or other regional facilities to the extent that substantial physical deterioration of the facility would occur or be accelerated.
- Include recreational facilities or require construction or expansion of recreational facilities that might have a physical effect on the environment.

As indicated in the *L.A. CEQA Thresholds Guide* (City of Los Angeles 2006), significant impacts to community/public facilities would occur if the project could:

- Result in substantial adverse physical impacts associated with providing new or physically altered governmental facilities, need for new or physically altered governmental facilities, and construction that could cause significant environmental impacts to maintaining acceptable service ratios, response times, or other performance objectives for police protection, fire protection, schools, or other public facilities.
- Impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan.

3.3. Methodology

Potential impacts to parkland and community facilities, including Section 4(f) resources, were assessed by conducting an inventory of facilities located within 0.25 mile of either side of proposed project alignments, stations, and sites associated with construction (also referred to as the "project area"). A 0.25-mile radius from proposed alignments is consistent with

previous environmental analyses for Metro transit projects and identifies the facilities that are in closest proximity, thereby indicating those that could be directly or indirectly impacted by the proposed transit improvements.

Direct effects/impacts are those caused directly by, and immediately related to, project activities such as land acquisitions or noise from construction. This would occur only at facilities located adjacent to the project. Indirect effects/impacts are caused by the proposed project, but may occur later in time and at some distance from the project, or are in the chain of cause-and-effect relationships (such as elimination of parking that negatively affects a resource). Indirect effects/impacts would most likely occur at facilities adjacent to or in close proximity to the project.

This impact analysis for parklands and community facilities, including Section 4(f) resources, identifies locations of these facilities within the project area, and overlays the sites on the proposed transit alternatives to assess direct and indirect impacts. The first step was to identify parklands and community facilities within the area of potential impact. These sites were identified from existing sources, including planning documents for the City and County of Los Angeles; various internet sites for federal, state, and local agencies; map and satellite imagery of the area of potential impact; and field investigations. It should be noted that public parklands are protected as Section 4(f) resources, and were also identified for analysis. These sites are included on the figures in Section 4 that show the area of impact and are listed in the tables in Section 4 that show the proximity of each site to the alternative alignments.

The second step in the impact analysis was to consider potential short-term and long-term impacts on parklands and community facilities associated with construction and operation of the proposed project. The analysis addressed potential direct impacts from proposed acquisitions and indirect impacts from potential effects of project activities (i.e., construction of guideways and trackwork, underground and at-grade stations, tunnels, and below-grade separations) on pedestrian and vehicular access (including parking). Indirect impacts could be potentially significant if they create barriers or substantial disruption to pedestrian and vehicular access. , All applicable regulatory requirements and standards of significance were applied to analyze the potential for impacts.

Construction period impacts are discussed for each type of community facility, and specific facilities as appropriate. Operational impacts are anticipated to be primarily beneficial if they increase access to parks and community facilities.

Proximity impacts related specifically to traffic, safety, air quality, noise, and other related issues could also have an effect on parklands and community facilities. Effects on pedestrian and vehicular access are discussed further in the Transportation Technical Memorandum. Existing and future safety and security issues for motorists and the surrounding community are discussed in the Safety and Security Technical Memorandum. Other potential indirect

impacts related to air quality and noise impacts are addressed in the Air Quality and Noise Technical Memorandums, respectively.

This analysis also discusses cumulative (including growth inducing) impacts from construction and operation of the project alternatives. Cumulative impacts are environmental changes that result from the incremental impact of the project when added to other closely related past, present, and reasonably foreseeable projects. If there are no direct or indirect impacts, then there would be no cumulative effects.

3.4 Section 4(f) Evaluation Methodology

For Section 4(f) resources, the impact analysis includes a description of each affected public recreational land and facility and its significance. Significance is determined by consultation with federal, state, or local agencies that have jurisdiction over the site. Section 4(f) criteria for "use" (i.e., direct and constructive impacts) are applied to each resource identified. The analysis also describes alternatives that would avoid the use of the resource, measures that would minimize harm, and required coordination with other agencies.

Section 4(f) requires that lands meeting the 4(f) criteria must be protected unless unusual factors or unique problems are present, or the cost, environmental impacts, or community disruption from potential alternatives are particularly large. Therefore, if a Section 4(f) property would be impacted by a proposed project, the analysis must demonstrate that there are no other prudent and feasible alternatives that do not affect the 4(f) property.

If all potential alternatives include the use of Section 4(f) lands, the alternative that has the least overall impact on the resource (including mitigation measures), while still being prudent and feasible, is the alternative that must be selected.

This technical memorandum analyzes only Section 4(f) public recreational lands and facilities. An analysis of Section 4(f) effects related to historical resources is provided in the Historic, Archaeological, and Paleontological Resources Technical Memorandum.

4.0 AFFECTED ENVIRONMENT

This section describes the existing parklands and community facilities within the project area. The first part describes the general County and City settings for these facilities and the second part provides an inventory of existing facilities and maps showing the locations of each facility relative to each alternative's alignment.

4.1 Existing Parks and Community Facilities Context

The project area is encompassed by the jurisdictions of Los Angeles County and the City of Los Angeles. The following provides a general context for the parklands and community facilities under these jurisdictions:

4.1.1 Los Angeles County

Parks and Recreation: Los Angeles County offers its residents an array of parks, gardens, and beaches. There is one county park, the Civic Center Mall, located within 0.25 miles of the proposed alternatives. It is located adjacent to the Hall of Administration and the County Courthouse, on the block bounded by 1st Street, Hill Street, Temple Street, and Grand Avenue.

Police Services: The Los Angeles County Sheriff's Department (LACSD) currently employs approximately 9,474 sworn peace officers and 7,738 professional staff. The LACSD is comprised of 11 divisions, which provide law enforcement services to 40 contract cities, 90 unincorporated communities, 9 community colleges, Metro, and 48 superior courts (County of Los Angeles 2007). There are no LACSD stations located within 0.25 miles of the proposed alternatives.

Fire Services: The Los Angeles County Fire Department (LACFD) provides fire and safety services to unincorporated areas of Los Angeles County, contracted cities, and cities that are under an agreement for the cooperative response and management of fires and other emergency incidents, including the City of Los Angeles. The LACFD currently employs over 4,500 personnel, ranging from firefighters and paramedics to lifeguards and pilots. The LACFD operates 165 fire stations and several fire prevention offices (County of Los Angeles 2007). There are no LACFD fire stations within 0.25 miles of the proposed alternatives.

Libraries: Los Angeles County provides library services to residents living in the unincorporated areas of the County. One Los Angeles County library (Los Angeles County Law Library) is located within 0.25 miles of the proposed project.

Educational Facilities: There are no Los Angeles County educational facilities within the project area.

Other Community Facilities: A portion of the project area extends through the Civic Center, where there are number of government buildings and public facilities. There are five Los Angeles County government offices within the project area: the Los Angeles County Hall of Records, Los Angeles Archives & Records Center, Los Angeles County Courthouse, and two Los Angeles Superior Court locations (Broadway and Temple Street and 1st and Hill Streets).

4.1.2 City of Los Angeles

4.1.2.1 Central City Community Plan Area

Parks and Recreation: Downtown Los Angeles has the least amount of public open space of any major U.S. urban center. There are seven public parks and recreational facilities operated by the City of Los Angeles Department of Recreation and Parks in the Central City Community Plan area. Four of those parks (Pershing Square, City Hall South Lawn Park, Grand Hope Park, and Los Angeles Plaza Park) are located within 0.25 miles of the proposed project. Maguire Gardens is a landscaped open space located adjacent to all of the proposed alternatives at 5th and Flower Streets, but it is designated by the City of Los Angeles as a public facility, not a park. Fletcher Bowron Square is located near the proposed alternatives, but it is also designated as a public facility, not a park. In addition to these public spaces, there are a number of private building-related parks and plazas.

Police Services: The LAPD provides police protection services in the City of Los Angeles, which is an area of approximately 483 square miles, with 21 communities representing approximately four million residents (LAPD 2007). In addition to administrative and special investigative units, the City of Los Angeles is divided into four smaller operational units, or bureaus: the Central Bureau, the South Bureau, the West Bureau, and the Valley Bureau.

To facilitate response times, the LAPD has approximately 21 individual police stations located throughout the bureaus. The LAPD employs approximately 9,600 sworn and 2,900 civilian personnel, providing an average of approximately 2.4 sworn officers per 1,000 people (LAPD 2007). The LAPD Headquarters is located within 0.25 miles of the proposed project. The Central Bureau Station also services the area, but is located more than 0.25 miles from the proposed build alternatives. Additionally, the United States Department of Justice Los Angeles Federal Metropolitan Detention Center jail facility is located within 0.25-miles of all of the alternatives.

Fire Services: The LAFD provides fire suppression, emergency medical care, technical rescue, hazardous materials handling, disaster response, and community services to the City of Los Angeles. The LAFD has 3,594 uniformed personnel and 346 non-sworn support personnel located at 106 neighborhood fire stations, serving a 471-square-mile jurisdiction (LAFD 2008). There are 1,101 uniformed firefighters, including 226 firefighter/ paramedics, always on duty throughout the City. The location and number of stations that would be called in the event of a fire or other emergency depends on a number of factors, including the type of emergency,

severity of the emergency, and availability of the nearest fire station. In actuality, the resources of the entire LAFD force could be available collectively. There are three fire stations within the Central City Community Plan area and one of them lies within 0.25-miles of the proposed alternatives: Fire Station No. 3 at 1st Street and Fremont Avenue.

Libraries: There are two public libraries operated by the Los Angeles Public Library system within the Central City Community Plan area. Both of these are located within 0.25 miles of the proposed project. These libraries are the Central Library in the Financial District on Flower and 5th Streets and the Little Tokyo Branch Library at Alameda and 3rd Streets. Additionally, there are six other libraries in the area that are open to the public at least on a limited basis.

Educational Facilities: The LAUSD is the primary school district within the City of Los Angeles. The LAUSD encompasses a service area of almost 704 square miles, which is broken into eight local districts. In addition to the City of Los Angeles, the LAUSD serves all or portions of several incorporated cities and portions of the County, thus representing a total population of approximately 4.5 million residents. The LAUSD operates approximately 1,190 schools, including kindergarten through grade 12 (K-12), community and occupational centers, and charter schools (LAUSD 2008). The LAUSD is undergoing a $19.3 billion voter-approved transformation to build new schools and improve existing facilities. These improvements are being implemented to reduce overcrowding throughout the district. Since the program began in 2000, 67 new schools have been constructed, 12 new schools are currently under construction, 19 projects are under construction, and 171 projects have been completed (LAUSD 2008). Within the Central City Community Plan area, there is only one public elementary school. However, the area is also served by another elementary school in Chinatown, a high school in Westlake, a junior high in Boyle Heights, and the planned Edward R. Roybal Learning Center in Central City West. Three LAUSD high schools lie within 0.25 miles of the proposed project (California Academy for Liberal Studies Early College High School, Oscar de la Hoya Amino Leadership Charter High School, and High School for the Visual and Performing Arts).

Other Community Facilities: There are a number of other community facilities both within the Central City Community Plan area and within 0.25 miles of the proposed project alternatives. These include six museums, two medical facilities, ten day-care facilities, and numerous religious facilities.

4.1.2.2 Central City North Community Plan Area

Parks and Recreation: The City of Los Angeles Department of Recreation and Parks operates two community parks and nine neighborhood parks in the Central City North Community Plan area. None of these parks is located with 0.25 miles of the proposed project.

Police Services: Police protection services are provided by the LAPD. One police station, the Chinatown Substation, serves the area. There are no Central City North Community Plan police stations located within 0.25 miles of the proposed project alignments.

Fire Services: Fire services are provided by the LAFD. Two fire stations provide fire protection in the Central City North Community Plan area. Only one is within 0.25 miles of the proposed alignments. LAFD Station No. 4, is located on Temple Street between Garey and Alameda Streets.

Libraries: Two public libraries serve the Central City North Community Plan area. The Chinatown Branch Library in Chinatown at Castelar Elementary School is located outside the 0.25-mile radius around the proposed alignments. The Little Tokyo Branch Library is in the Central City Community Plan area, but serves the Central City North Community Plan area as well. The Little Tokyo Branch Library lies within 0.25 miles of the proposed project alignments.

Educational Facilities: The LAUSD is the primary school district servicing the Central City North Community Plan area. Within the community plan area are two elementary schools and one high school. Other LAUSD schools outside of the Central City North Community Plan area that serve the area include an elementary and junior high school in Boyle Heights, an elementary school in Central City, a high school in Westlake, and a junior high school in Lincoln Heights. None of these LAUSD schools are within 0.25 miles of the proposed project. No private schools are located within 0.25 miles of the proposed alignments.

Other Community Facilities: Other community facilities within the Central City North Community Plan area include two daycares, two religious facilities, and one medical facility within 0.25 miles of the proposed project alternatives.

4.2 Existing Parklands and Community Facilities

Existing parklands and community facilities within the area are described in the following paragraphs. The parklands and community facilities that service the area or are within 0.25 miles of the proposed project alternatives alignments and stations are detailed in Figures 4-1 through 4-12 and Tables 4-2 through 4-4. Figures 4-1 through 4-4 show parklands and recreational resources within 0.25 miles of each alternative and correspond to the numbers on Table 4-2, which describes each facility. Figures 4-5 through 4-8 show public services and religious facilities within 0.25 miles of each alternative and correspond to the numbers on Table 4-3, which describes each facility. Figures 4-9 through 4-12 show educational facilities within 0.25 miles of each alternative and correspond to the numbers on Table 4-4, which describes each facility.

Table 4-1 summarizes the number of parklands and community facilities located within 0.25 miles of the proposed project. Figures 4-1 through 4-4 and Table 4-2 pertain to the parklands

and other recreational resources—including parklands, museums, and recreational facilities—located within the project area and associated with the proposed alternatives.

5.0 IMPACTS

This section analyzes the potential impacts to parklands and community facilities associated with six project alternatives: No Build (Baseline), Transportation System Management (TSM), At-Grade Emphasis Light Rail Transit (LRT), Underground Emphasis LRT, Fully Underground LRT Alternative – Little Tokyo Variation 1, and Fully Underground LRT Alternative – Little Tokyo Variation 2. The analysis is organized by community facility type and each alternative, except Fully Underground LRT Alternative – Little Tokyo Variation 1 and 2 is addressed separately under each facility type. Fully Underground LRT Alternative – Little Tokyo Variation 1 and Fully Underground LRT Alternative – Little Tokyo Variation 2 were analyzed together due to their similarities.

5.1 Parklands and Recreational Resources

5.1.1 No Build Alternative

The No Build Alternative would maintain existing transit service through the year 2035. No new transit infrastructure would be built, aside from projects currently under construction or identified in Metro's *2009 Long Range Transportation Plan*. Therefore, parklands and recreational resources would not be affected by this proposed alternative. In addition, the projects under the No Build Alternative would undergo project-specific environmental review, as appropriate.

Due to the various locations, distance from the proposed project, and additional project-specific environmental review, the projects under the No Build Alternative would not result in significant direct or indirect adverse impacts on parklands, recreational resources, or other Section 4(f) lands within the project area. The No Build Alternative would not have the beneficial impact of increasing non-auto access to recreational areas and open space amenities throughout the region, including to and from downtown. In summary, no cumulative impacts would occur under the No Build Alternative because there would be no significant direct and indirect adverse impacts.

5.1.2 TSM Alternative

The TSM Alternative would include provisions of the No Build Alternative and add two shuttle bus routes to simulate the proposed LRT link between 7th Street/Metro Center and Union Stations. Buses would run frequently, perhaps just a few minutes apart during peak hours, and the routes would be designed to move passengers between the two stations as quickly as possible.

The Upper Grand Shuttle Bus Route would be along Grand Avenue and Temple and Los Angeles Streets, and the Lower Grand Shuttle Bus Route would be along Figueroa, Flower, Second, 3rd, and Alameda Streets. Shuttle buses would use existing bus-only lanes, where

available, and peak hour bus-only lanes would be created where possible by restricting parking on streets that do not already have dedicated all-day bus lanes. The shuttle buses would be fitted with a Transit Priority System (TPS) similar to those used on Metro Rapid to increase bus speed and efficiency.

Stops would be located every two or three blocks to provide adequate coverage of the project service area. The shuttle routes would be operated by Metro and could use 30-foot shuttle buses. As shown on Figure 4-1, the TSM Alternative would be operated within existing public rights-of-way (i.e., streets) and would not have adverse direct or indirect impacts on parklands, recreational resources, or other Section 4(f) lands.

Removal of curb parking spaces may be needed along 2nd Street to create new bus stops for the Lower Grand Route. However, this would not effectively impede access to any surrounding parks or public facilities because there are several large surface parking lots and garages nearby. The TSM Alternative would have a beneficial impact of increasing non-auto access to recreational areas and open space amenities within the downtown area. No cumulative impacts would occur under the TSM Alternative because no direct and indirect adverse impacts are expected.

5.1.3 At-Grade Emphasis LRT Alternative

Table 5-1 summarizes potential impacts to parklands and recreational resources located within 0.25 miles of the At-Grade Emphasis LRT Alternative. The At-Grade Emphasis LRT Alternative would use a combination of at-grade and underground tracks along Temple, Main, Los Angeles, 2nd, and Flower Streets.

5.1.3.1 Acquisition

The At-Grade Emphasis LRT Alternative would include acquisition of additional right-of-way for tracks along the alignment, at-grade stations, and portals to underground stations. Under the worst case scenario, this alternative's alignment would reduce the 2nd Street tunnel from four lanes to a minimum of one lane. One travel lane and 23 on-street parking and five loading spaces along the south side of 2nd Street would be removed to Los Angeles Street, which would leave a single travel lane primarily for access to parking lots and loading zones.

In addition, new right-of-way would be needed for the at-grade double tracks on Flower Street between 4th and 3rd Streets (including the intersection at 3rd and Flower Streets) and on Temple Street between Los Angeles and Alameda Streets. Proposed at-grade single tracks would require property acquisition on Main and Los Angeles Streets between 2nd and Temple Streets, and on Temple and 2nd Streets between Main and Los Angeles Streets. The at-grade stations on Main Street north of 1st Street and on Los Angeles Street north of 1st Street could require acquisition of additional right-of-way. There would be no need for acquisitions, only possible

easements, for the pedestrian entrances to the stations on Flower Street south of 5th Street and southwest of 2nd and Hope Streets.

Construction staging for the proposed Flower/6th/5th Street station is expected to occur within the public right-of-way (i.e., sidewalk) adjacent to the Maguire Gardens at the Los Angeles Central Library, along Flower Street. Construction staging would also be required along the City Hall South Lawn Park's Main Street boundary as part of the proposed Main/1st Street station.

Maguire Gardens is not a designated City park, but an open space area that is part of the Central Library. The garden consists of a grass lawn, seating, and a water feature. In addition, there is a five-story subterranean parking structure located underneath the garden.

City Hall South Lawn Park is a designated park and consists of a lawn, landscaping, and a memorial. The park is mostly used for passive recreation.

The At-Grade Emphasis LRT Alternative would not result in direct or indirect impacts to parklands and recreational facilities from acquisition of or easements on either Maguire Gardens or City Hall South Lawn Park. In addition, because the At-Grade Emphasis LRT Alternative would be located within the existing street system and along existing right-of-way, no direct or indirect impacts associated with acquisition of or easements on a Section 4(f) would occur. Therefore, the At-Grade Emphasis LRT Alternative would not adversely affect the features, attributes, or activities of Section 4(f) parklands or recreational facilities.

[1] Map numbers correspond to Figure 4-2
[2] Temporary construction-related effects

No current and reasonably foreseeable related actions/projects would result in direct or indirect adverse impacts on the Maguire Gardens at the Central Library, City Hall South Lawn Park, or other parklands. In addition, no current and reasonably foreseeable related actions/projects would involve direct or indirect adverse impacts to other recreational resources within 0.25 miles of the At-Grade Emphasis LRT Alternative. Therefore, no cumulative impacts to parklands and recreational facilities would occur under the At-Grade Emphasis LRT Alternative.

5.1.3.2 Access

For the at-grade segments of the At-Grade Emphasis LRT Alternative, the two LRT tracks would typically occupy a 26-foot-wide surface right-of-way bordered by mountable curbs. An approximately 13-foot right-of-way would be needed along roadway segments with one LRT track, including the couplet on Main and Los Angeles Streets. The Main/1st Street and Los Angeles/1st Street couplet station platforms would require approximately 20 additional feet of right-of-way.

Vehicular and pedestrian crossings would be limited to traffic signal-controlled intersections, with the signal phasing modified to provide adequate green time for the LRT vehicles to cross safely. For safety reasons, no uncontrolled mid-block vehicular crossings of the tracks would be permitted.

Access to existing parking structures, parking lots, loading docks, and commercial frontage would be affected by the at-grade LRT facilities. Left-turn parking ingress and egress is presently allowed at many downtown sites. However, the at-grade LRT facilities would eliminate uncontrolled mid-block left turns, thus modifying existing approach and departure traffic patterns.

The proposed At-Grade Emphasis LRT alignment travels at-grade along 2nd Street, and it is assumed that this street would be dedicated as a transit-only roadway between the 2nd Street tunnel and Los Angeles Street. This segment of 2nd Street would be closed to through traffic and provide only emergency vehicle access and local access to adjacent properties.

To minimize conflicts between rail, vehicular, and pedestrian traffic, and to minimize delays at the intersection of Temple and Alameda Streets, this alternative includes a vehicular underpass and a pedestrian overpass along Alameda Street. The underpass would route through traffic beneath the rail tracks and Temple Street traffic. Through traffic traveling north and south on Alameda Street would operate unimpeded without being stopped or delayed at the intersection. In addition, a one-lane, southbound, at-grade frontage road would be provided along Alameda Street to maintain access to businesses and properties on the west side of the street. Three bus loading zone spaces on Alameda Street adjacent to the Japanese American National Museum would have to be permanently removed to accommodate the underpass and associated frontage roads. The museum staff has indicated that many visitors arrive via school buses that unload in these spaces. However, additional bus loading zone spaces are available in front of the museum on 1st Street, and replacement loading spaces could be identified at other locations in close proximity to the museum entrance. Access to the museum's loading dock would be maintained.

During construction, the At-Grade Emphasis LRT Alternative would potentially impact vehicle access to an underground structure along Flower Street adjacent to the Maguire Gardens, pedestrian access to the gardens, and the City Hall South Lawn Park. Although access would be modified during construction, these impacts would be temporary and limited only to the portion of the sites adjacent to the proposed project; therefore, potential impacts on access would not be significant.

During operation of this alternative, the proposed stations in the vicinity of the Maguire Gardens and City Hall South Lawn Park would potentially modify pedestrian access. However, the modifications would be beneficial because the stations would increase access to these open space/park areas. No vehicle access impacts to recreational resources would occur during operation.

Construction of the underpass at Temple and Alameda Streets would occur along Alameda Street between US 101 and 1st Street. This could temporarily interupt vehicle and pedestrian access to the Geffen MOCA and Japanese American National Museum.

City Hall South Lawn Park is the only officially designated park subject to Section 4(f) evaluation along the At-Grade Emphasis LRT Alternative. Construction of the Main/1st Street station would potentially result in a temporary, indirect impact to pedestrian access to this public park. However, due to size and lack of active space and recreational amenities, the City Hall South Lawn Park is not considered a "significant public park" under Section 4(f). Any impacts to the park would be temporary and would not substantially diminish or adversely affect access to the property; therefore, the At-Grade Emphasis LRT Alternative would not adversely affect the features, attributes, or activities of the park.

There are no current and reasonably foreseeable related actions/projects in the vicinity of the open space/park areas (Maguire Gardens and City Hall South Lawn Park) that would be under construction at the same period of the At-Grade Emphasis LRT Alternative (years 2014 through 2018). Therefore, a cumulative impact would not occur under the At-Grade Emphasis LRT Alternative.

5.1.3.3 Parking

Construction of at-grade tracks along 2nd Street and the need for adequate street widths to provide local access lanes would require elimination of 23 existing on-street parking and five loading spaces to accommodate the At-Grade Emphasis LRT Alternative. This loss of parking may result in spillover to adjacent streets if parking on these streets is readily available.

The Alternative Analysis study showed that the number of parking spaces potentially lost under the At-Grade Emphasis LRT Alternative would total 88, with 35 of those spaces located on 2nd Street between Hill and Los Angeles Streets. Recent restriping by the City of Los Angeles to incorporate left-turn pockets has reduced the number of parking spaces potentially lost with this proposed alternative. All of the potentially lost parking spaces would be in the Civic Center, Historic Core, and Bunker Hill areas. No on-street parking would be displaced in the community of Little Tokyo.

In addition, 12 spaces may also be lost along the south side of Temple Street west of Alameda Street due to the proposed underpass. On the north side of Temple Street, the four off-peak parking spaces between Main and Los Angeles Streets would be eliminated. Consequently, it may be necessary to implement mitigation measures such as off-street parking facilities to replace the lost curb spaces. On the east side of Flower Street between 5th and 3rd Streets, seven curb spaces would be removed within one block of Maguire Gardens. An additional five on-street parking spaces on the west side of the street would also be removed. However, this localized loss of parking would not result in an adverse impact to garden access because there is a multi-level parking structure underneath, and several others nearby.

No on-street parking in the immediate vicinity of parkland or recreational resource along the alignment would be affected; therefore, there would be no direct or indirect construction and operational impacts to on-street parking. In addition, there are various nearby off-street

parking options available throughout the project area. Furthermore, operation of the proposed project would be beneficial by providing enhanced access to adjacent parklands and recreational resources.

On the south side of Temple Street, 12 curb parking spaces would need to be removed permanently to accommodate the new light rail tracks. It is possible that these spaces are currently being used by museum visitors. After construction is complete, however, non-automobile access to these museums would be greatly improved by the new transit service, which would more than offset the loss of curb parking.

The At-Grade Emphasis LRT Alternative would not impact a Section 4(f) resource; therefore, the At-Grade Emphasis LRT Alternative would not adversely affect the features, attributes, or activities associated with parklands or recreational resources. Cumulative impacts to parks and recreational facilities would not occur under the At-Grade Emphasis LRT Alternative because no direct or indirect adverse impacts on parking would occur during construction or operation.

5.1.4 Underground Emphasis LRT Alternative

Table 5-2 summarizes impacts to parklands and recreational resources located within 0.25 miles of the Underground Emphasis LRT Alternative. The Underground Emphasis LRT Alternative would have a single at-grade crossing at the intersection of 1st and Alameda Streets; the rest of the route would be constructed underground.

Table 5-2. Parklands and Recreational Resources Within 0.25 Miles of the Proposed Underground Emphasis LRT Alternative

[1] *Map numbers correspond to Figure 4-3*

[2] *Temporary construction-related effects*

5.1.4.1 Acquisition

The Underground Emphasis LRT Alternative would require acquisition of private property for additional right-of-way. The single at-grade crossing at the intersection of 1st and Alameda Streets would require acquisition of additional right-of-way at this intersection.

The tracks on 2nd Street would veer north through a new portal located on private property; therefore, acquisition of part of the block bounded by Central Avenue, Alameda Street, 1st Street, and 2nd Street would be required. This block is currently occupied entirely by retail and restaurant businesses. No other acquisitions would be needed for the LRT tracks because the rest of the route would be underground.

The Underground Emphasis LRT Alternative would also require property acquisition for pedestrian entrances to stations on Flower Street north of 5th Street, southwest of the intersection of 2nd and Hope Streets, and on 2nd Street either between Broadway and Spring Street or between Main and Los Angeles Streets.

The Underground Emphasis LRT Alternative would not result in a direct or indirect impact (i.e., acquisition or easement) to any parkland or recreational resource. Therefore, there would be no significant adverse impact.

No Section 4(f) resources are located adjacent to the areas needed for construction or operation of this alternative. Therefore, there would be no direct or indirect significant adverse impacts on access to Section 4(f) lands.

No current or reasonably foreseeable related actions/projects would involve direct or indirect adverse impacts on parklands or recreational resources. Therefore, there would be no cumulative impacts under the Underground Emphasis LRT Alternative.

5.1.4.2 Access

The Underground Emphasis LRT Alternative alignment does not affect surface traffic or pedestrian circulation except at the intersection of Alameda and 1st Streets, where the LRT alignment operates in an at-grade configuration. Consequently, vehicular circulation patterns along downtown streets adjacent to most of the alignment would continue to operate the same as current traffic flow patterns.

A vehicular underpass and pedestrian overpass are proposed at the intersection of Alameda and 1st Streets to minimize potential delays by separating the heavy traffic volumes along Alameda Street from rail traffic. The proposed underpass would result in uninterrupted flow along Alameda Street in the north and south directions between 2nd and Temple Streets. In addition, at-grade frontage roads would be provided along both sides of Alameda Street south of the intersection and on the southbound side of the street north of the intersection to maintain access to adjacent businesses and properties. A full northbound frontage road is

infeasible because of the location of the rail tracks and the Little Tokyo/Arts District Station on the east side of Alameda Street.

Potential direct and indirect impacts to vehicle or pedestrian access to parklands and recreational resources would be minimal because a majority of the construction and operation of the Underground Emphasis LRT Alternative would occur underground. Construction associated with the Flower/5th/4th Street station could temporarily affect pedestrian access along a portion of Maguire Gardens. Three bus loading zone spaces on Alameda Street adjacent to the Japanese American National Museum would have to be permanently removed to accommodate the underpass and associated frontage roads. The museum staff has indicated that many visitors arrive via school buses that unload in these spaces. However, additional bus loading zone spaces are available in front of the museum on 1st Street, and replacement loading spaces could be identified at other locations in close proximity to the museum entrance. Access to the museum's loading dock would be maintained.

Operation of this alternative would not adversely impact access to parklands or recreational resources. In fact, as with the At-Grade Emphasis LRT Alternative, operation would be beneficial by increasing pedestrian access (via the stations) to these parklands and recreational resources.

Construction of the underpass at 1st and Alameda Streets would require work along Alameda Street between Temple and 2nd Streets. This would cause temporary access detours for the Geffen MOCA and Japanese American National Museum. Most of these potential traffic impacts would be resolved once construction is completed.

No Section 4(f) resources are located adjacent to the areas needed for construction or operation of this alternative. Therefore, no direct or indirect adverse impacts on access to Section 4(f) lands would occur.

No current and reasonably foreseeable related actions/projects would involve direct or indirect adverse impacts on parklands or recreational resources. Therefore, no cumulative impacts would occur under the Underground Emphasis LRT Alternative.

5.1.4.3 Parking

With the proposed alignment mostly underground, the Underground Emphasis LRT Alternative would result in a loss of on-street public parking spaces along Flower and Alameda Streets. Seven curb spaces would be removed on Flower Street between 5th and 3rd Streets, which is within one block of Maguire Gardens. However, there would be no adverse impact to garden access because there is a multi-level parking structure underneath, and several others nearby.

The proposed underpass at 1st and Alameda Streets would result in the loss of existing private parking spaces along the east side of Alameda Street near the intersection. Approximately 10 on-street spaces would be displaced, including three bus tour loading spaces. Construction of the Underground Emphasis LRT Alternative would temporarily displace parking spaces along the alignment for the duration of construction in that particular location.

No parkland or recreational resource would be directly impacted by the displaced parking. However, there is the potential that the ten on-street parking spaces displaced could be used by patrons going to the Japanese American National and MOCA (Geffen) museums. However, this would not be an adverse or significant effect on parking for these recreational resources because this indirect impact would be temporary (during construction) and there are off-street parking lots in the area. Also, non-automobile access to the museums would be significantly improved by the new transit service, which would offset the effects of the lost parking spaces.

No Section 4(f) resources are located adjacent to the areas needed for construction or operation of this alternative. Therefore, no would be no direct or indirect adverse impacts on access to Section 4(f) lands.

No current and reasonably foreseeable related actions/projects would involve direct or indirect significant adverse impacts on parklands or recreational resources. Therefore, no cumulative impacts would occur under the Underground Emphasis LRT Alternative.

5.1.4.4 Design Options

The Underground Emphasis LRT Alternative includes the following two design options:

- 2nd Street station – Broadway Option: This option would include an underground station on 2nd Street between Broadway and Spring Street.
- 2nd Street station –Los Angeles Street Option: This option would include an underground station on 2nd Street between Main and Los Angeles Streets.

No direct or indirect adverse impacts on parklands and recreational resources from construction and operation of this alternative would occur from acquisition, access, or parking associated with either of the two design options.

5.1.5 Fully Underground LRT Alternative – Little Tokyo Variation 1 and Fully Underground LRT Alternative – Little Tokyo Variation 2

Table 5-3 summarizes impacts to parklands and recreational resources located within 0.25 miles of the Fully Underground LRT Alternative – Little Tokyo Variation 1 and Fully Underground LRT Alternative – Little Tokyo Variation 2. The entire route would be located

underground, and there would be no at-grade crossings constructed as part of these alternatives.

5.1.5.1 Acquisition

The Fully Underground LRT Alternative would require acquisition of private property for additional right-of-way. The tracks on 2nd Street would veer north through a new station located beneath private property on the block bounded by Central Avenue, Alameda Street, 1st Street, and 2nd Street. This block is currently occupied entirely by retail and restaurant businesses.

Metro has identified the entire block for acquisition to stage construction and build a new underground station, station entrances, and ancillary facilities. This block could potentially be used to launch tunnel boring machines and transport material from the tunnels. Metro intends to maintain some of the existing businesses acquired on Central Avenue between 1st and 2nd Streets that are not directly impacted by construction activities. Acquisition of the entire block represents a worst-case scenario. However, no impacts to parklands or recreational resources would occur.

Potential reductions in acquisition on this block may occur based on further engineering analysis during the preliminary engineering and final design stages. Acquisition of part of the vacant parcel on the northeast corner of 1st and Alameda Streets would also be needed for tunnel and portal construction. Additionally, the Fully Underground LRT Alternative – Little Tokyo Variation 2 would require acquisition of small vacant portions of two parcels on the south side of 1st Street between Hewitt and Garey Streets. None of these acquisitions would affect or impede access to any parklands or recreational resources. In addition, property acquisition could be needed for pedestrian entrances to stations on Flower Street north of 5th Street, southwest of the intersection of 2nd and Hope Streets, and on 2nd Street between Broadway and Spring Street.

Neither Fully Underground LRT Alternative – Little Tokyo Variations 1 or 2 would result in a direct or indirect impact (i.e., acquisition or easement) to any parkland or recreational resource. Therefore, there would be no significant adverse impact.

No Section 4(f) resources are located adjacent to the areas needed for construction or operation of these alternatives. Therefore, there would be no direct or indirect significant adverse impacts on access to Section 4(f) lands.

No current and reasonably foreseeable related actions/projects would involve direct or indirect adverse impacts on parklands or recreational resources. Therefore, no cumulative impacts would occur under either alternative.

Table 5-3. Parklands and Recreational Resources Within 0.25 Miles of the Proposed Fully Underground LRT Alternative – Little Tokyo Variation 1 and Fully Underground LRT Alternative – Little Tokyo Variation 2

Source: CDM 2009
[1] Map numbers correspond to Figure 4-4.
[2] Temporary construction-related effects.

5.1.5.2 Access

The Fully Underground LRT Alternative – Little Tokyo Variations 1 and 2 alignments would not affect surface traffic or pedestrian circulation except at the intersection of 1st and Hewitt Streets, where the alignment would prevent cars and pedestrians from crossing 1st Street. Pedestrians and automobiles would still be able to cross nearby at Vignes Street. Consequently, vehicular circulation patterns along downtown streets adjacent to most of the alignment would continue to operate as they do today.

Since a majority of construction and operation of the two alternatives would occur underground, potential direct and indirect impacts to vehicle or pedestrian access to parklands and recreational resources would be minimal. Construction associated with the Flower/5th/4th Street station could temporarily affect pedestrian access along a portion of Maguire Gardens. Operation of this alternative would not adversely impact access to parklands or recreational resources. In fact, as with the At-Grade Emphasis LRT Alternative and Underground Emphasis LRT Alternative, operation would be beneficial by increasing pedestrian access (via the stations) to these parklands and recreational resources.

During construction, both of the Fully Underground LRT Alternatives may require temporary closure of three bus loading zone spaces on Alameda Street adjacent to the Japanese American National Museum. The museum staff has indicated that many visitors arrive via school buses that unload in these spaces. However, additional bus loading zone spaces are available in front of the museum on 1st Street, and temporary alternate loading spaces could be identified at other locations in close proximity to the museum entrance during construction. Access to the museum's loading dock would be maintained.

No Section 4(f) resources are located adjacent to the areas needed for construction or operation of this alternative. Therefore, no direct or indirect adverse impacts on access to Section 4(f) lands would occur.

No current or reasonably foreseeable related actions/projects would involve direct or indirect adverse impacts on parklands or recreational resources. Therefore, no cumulative impacts would occur under Fully Underground LRT Alternative – Little Tokyo Variations 1 or 2.

5.1.5.3 Parking

Parking impacts of the Fully Underground LRT Alternative – Little Tokyo Variations 1 and 2 would be identical to the Underground Emphasis LRT Alternative except in the vicinity of 1st and Alameda Streets. Here, existing on-street parking and loading spaces would be maintained because the two Fully Underground LRT Alternatives would not include an underpass or pedestrian bridge.

No Section 4(f) resources are located adjacent to the areas needed for construction or operation of this alternative. Therefore, no direct or indirect adverse impacts on access to Section 4(f) lands would occur.

No current or reasonably foreseeable related actions/projects are anticipated to involve direct or indirect significant adverse impacts on parklands or recreational resources. Therefore, no cumulative impacts would occur under either alternative.

5.2 Public Services and Religious Facilities

5.2.1 No Build Alternative

The No Build Alternative would maintain existing transit service through the year 2035. No new transit infrastructure would be built aside from projects currently under construction or identified in Metro's *2009 Long Range Transportation Plan*. Therefore, public facilities would not be affected by the proposed project.

The No Build Alternative would not result in significant adverse impacts on public services and religious facilities (including emergency response times or access). No cumulative

impacts would occur under the No Build Alternative because no significant direct and indirect adverse impacts would occur.

5.2.2 TSM Alternative

The TSM Alternative would include the provisions of the No Build Alternative and add two shuttle bus routes to provide a transit link between 7th Street/Metro Center and Union Stations. The Upper Grand Shuttle Bus Route would be along Grand Avenue and Temple and Los Angeles Streets and the Lower Grand Shuttle Bus Route would be along Figueroa, Flower, 2nd, 3rd, and Alameda Streets. Shuttle buses would use existing bus-only lanes, where available, and peak hour bus-only lanes would be created where possible by restricting parking on streets that do not already have dedicated all-day bus lanes. Stops would be located every two or three blocks to provide adequate coverage of the project service area. As shown in Figure 4-4, the TSM Alternative would be operated within public rights-of-way (i.e., streets).

Improvements associated with the TSM Alternative would add additional buses along the proposed routes. These additional buses would not have a significant adverse direct impact on public services and religious facilities. Even though the TSM Alternative improvements would require very minimal construction, operation of additional buses along the proposed routes could result in an indirect impact on traffic. However, this would not have a significant adverse impact on traffic.

Construction and operation of the TSM Alternative would not have significant adverse direct or indirect impacts on public services and religious facilities. No cumulative impacts would occur from the TSM Alternative because no significant direct and indirect adverse impacts would occur.

5.2.3 At-Grade Emphasis LRT Alternative

Table 5-4 summarizes the impacts to public facilities located within 0.25 miles of the At-Grade Emphasis LRT Alternative. The At-Grade Emphasis LRT Alternative would use a combination of at-grade and underground tracks along Temple, Main, Los Angeles, 2nd, and Flower Streets.

5.2.3.1 Acquisition

The At-Grade Emphasis LRT Alternative would require property acquisitions and easements to create sufficient right-of-way for the tracks along the alignment, at-grade stations, and entrances to the underground stations. In addition, the proposed at-grade stations on Main Street north of 1st Street and on Los Angeles Street north of 1st Street would require acquisition of additional right-of-way. Pedestrian entrances to proposed underground stations on Flower Street south of 5th Street and southwest of 2nd Street and Hope Streets would not require acquisition, only possible easements. The At-Grade Emphasis LRT Alternative would result in a direct impact (i.e., permanent partial take) to portions of the Los Angeles City Hall East/Annex and Parker Center properties for the Main Street and Los Angeles Street stations.

Construction of the Flower/6th/5th Street station would require temporary use of the sidewalk for construction staging adjacent to the Los Angeles Central Library along the portion known as the Maguire Gardens. No acquisition associated with the Central Library facility is proposed and construction staging would not impact the library building. Portions of the City Hall East/Annex and Parker Center properties that would be permanently acquired would not result in a significant adverse effect on the buildings or the function of the sites.

Construction and operation of the At-Grade Emphasis LRT Alternative would not have significant adverse direct or indirect impacts related to acquisitions and easements on public services and religious facilities. No cumulative impacts to public services and religious facilities would occur under the At-Grade Emphasis LRT Alternative because no significant direct and indirect adverse impacts would occur.

Table 5-4. Public Services and Religious Facilities Within 0.25 Miles of the Proposed At-Grade Emphasis LRT Alternative

[1] *Map numbers correspond to Figure 4-6.*

[2] *Temporary construction-related effects.*

[3] *The Central Community Police Station of the Central Bureau serves the project area, but is not located within 0.25 miles of the proposed project.*

5.2.3.2 Access

Vehicular and pedestrian crossings would be limited to traffic signal-controlled intersections for the at-grade segments of the At-Grade Emphasis LRT Alternative. Signal phasing would be modified to provide adequate green time for the LRT vehicles to cross safely. Access to existing parking structures, parking lots, loading docks, and commercial frontage would be affected by the at-grade LRT facilities.

Left-turn parking ingress and egress is presently allowed at many downtown sites. The at-grade LRT facilities would eliminate uncontrolled mid-block left-turns, thus modifying existing approach and departure traffic patterns.

The proposed At-Grade Emphasis LRT alignment would travel at-grade along 2nd Street, and this street would be dedicated as a transit-only roadway between the 2nd Street tunnel and Los Angeles Street. This segment of 2nd Street would be closed to through traffic and provide only emergency vehicle access and local access to adjacent properties.

A vehicular underpass and a pedestrian overpass are proposed along Alameda Street to avoid potential conflicts between rail, vehicular, and pedestrian traffic, and to minimize delays at the intersection of Temple and Alameda Streets. Through traffic on Alameda Street would operate unimpeded without being stopped or delayed at the intersection. In addition, a one-lane, southbound, at-grade frontage road would be provided along Alameda Street to maintain access to the businesses and properties on the west side of the street.

During construction, the At-Grade Emphasis LRT Alternative would potentially impact (directly and indirectly) pedestrian and vehicle ingress and egress associated with public services and religious facilities along the entire at-grade alignment. Discrete locations along the alignment that could experience modified pedestrian and vehicle access during construction and operation include LAPD's Parker Center, Caltrans, Los Angeles City Hall and City Hall East/Annex, U.S. Federal Government Building (Roybal Center), Los Angeles Ambulatory Care Center, and the Little Tokyo Branch Public Library.

The At-Grade Emphasis LRT Alternative would also involve modifications to the intersection of Temple and Alameda, one block from LAFD Station #4. This could require re-routing of emergency vehicles, but Metro will attempt to avoid or minimize impacts to emergency response times. Further consultation with LAFD will be needed to determine the extent of this impact.

Standard specifications and traffic work plans would be developed to lessen potential construction impacts on emergency service providers by reducing potential impacts on emergency response times. Potential impacts on other public services and religious facilities during construction would be temporary and therefore would not be considered significant.

Although vehicle and pedestrian access during operation— particularly along Main, Los Angeles, 2nd, and Alameda Streets, and Temple Street near Alameda Street—would be modified, the At-Grade Emphasis LRT Alternative includes elements that would minimize conflicts between rail, vehicular, and pedestrian traffic, and minimize delays at intersections. In addition, modification of pedestrian access during operation of the alternative would be beneficial because the proposed project would increase access to these facilities. Therefore, the effect on vehicle or pedestrian access to and from public services and religious facilities would not be significant.

Reasonably foreseeable related actions/projects under construction at the same time as the proposed project – (years 2014 to 2018) would not involve a direct or indirect adverse impact on public services and religious facilities, including the Children's Museum and Art Park, Block 8, Vibiana Phase II, the Federal Courthouse, and the Grand Phases I-III. As with the proposed project, these projects would be required to coordinate with, as well as prepare and submit traffic work plans to, the City of Los Angeles Department of Transportation (LADOT). LADOT would review and coordinate potential access issues associated with construction and operation of the proposed project and other projects. Therefore, cumulative impacts would not be significant under the At-Grade Emphasis LRT Alternative.

5.2.3.3 Parking

Construction of at-grade tracks along 2nd Street and the need for adequate street widths to provide local access lanes would eliminate existing on-street parking and loading spaces. This potential loss of parking may result in spillover to adjacent streets if parking on these streets is readily available.

Under the At-Grade Emphasis LRT Alternative, a total of 80 on-street parking spaces would be eliminated, with 28 of those spaces located on 2nd Street between Hill and Los Angeles Streets. Recent restriping by the City of Los Angeles to incorporate left-turn pockets has reduced the number of parking spaces potentially lost under this project alternative. All of the eliminated parking spaces would be in the Civic Center, Historic Core, and Financial District areas. No on-street parking would be displaced in the community of Little Tokyo. Of the total 80 parking spaces eliminated, 12 spaces would be lost along the south side of Temple Street west of Alameda Street due to the proposed underpass. Mitigation measures would be considered, including providing off-street parking facilities to replace the eliminated curb spaces.

Construction of the At-Grade Emphasis LRT Alternative would potentially impact (directly and indirectly) on-street parking near public services and religious facilities along the entire at-grade alignment. Specific locations along the alignment that could potentially experience direct and indirect on-street parking impacts during construction and operation of this alternative include LAPD's Parker Center, Los Angeles City Hall and City Hall East/Annex, U.S. Federal Building (Roybal Center), Caltrans, Los Angeles Ambulatory Care Center, and the Little Tokyo Branch Public Library. In some instances, the potential impacts to on-street

parking during construction would be localized and temporary. In other locations (i.e., portions of 2nd and Temple Streets), on-street parking would be eliminated for both construction and operation of the proposed project.

Although the At-Grade Emphasis LRT Alternative would impact on-street parking, impacts to off-street parking would be minimal because the number of spaces eliminated is small compared to other parking available (on- and off-street) throughout the downtown area. In addition, the reduction in on-street parking would be balanced by the benefit that the proposed transit system would provide to downtown access. Therefore, the effect on public services and religious facilities related to potential impacts on parking would not be adverse or significant.

There are several reasonably foreseeable related actions/projects that would involve direct or indirect adverse impacts on public services and religious facilities in the area. As with the proposed project, these projects would be required to coordinate with, as well as prepare and submit traffic work plans to, LADOT. LADOT would review and coordinate potential parking issues associated with construction and operation of the proposed project and other projects. Therefore, cumulative impacts would not be significant from the At-Grade Emphasis LRT Alternative.

5.2.4 Underground Emphasis LRT Alternative

Table 5-5 summarizes potential impacts to public services and religious facilities located within 0.25 miles of the Underground Emphasis LRT Alternative. The Underground Emphasis LRT Alternative would have a single at-grade crossing at the intersection of 1st and Alameda Streets; the rest of the route would be constructed underground.

5.2.4.1 Acquisition

The Underground Emphasis LRT Alternative would require acquisition of private property to create adequate right-of-way for the proposed alignment. The alignment would have a single at-grade crossing at the intersection of 1st and Alameda Streets. This at-grade crossing would require property acquisition at the intersection.

Tracks on 2nd Street would veer north through a new portal located on private property; therefore, acquisition of part of the block bounded by Central Avenue, Alameda Street, 1st Street, and 2nd Street would be required. This block is currently occupied entirely by retail and restaurant businesses. No other acquisitions would be needed for the LRT tracks because the rest of the route would be underground.

The Underground Emphasis LRT Alternative would require acquisitions for pedestrian entrances to stations on Flower Street north of 5th Street, southwest of the intersection of 2nd and Hope Streets, and on 2nd Street either between Broadway and Spring Street or between

Main and Los Angeles Streets. Construction staging associated with the 2nd Street station - Broadway Option could potentially result in a temporary direct impact (i.e., easement) to a portion of the new LAPD headquarters property. The 2nd Street station – Los Angeles Street Option could potentially result in a direct impact (i.e., permanent partial take or temporary easement) to a portion of the new LAPD headquarters (easement for construction staging), Caltrans building (partial take for station entrance), and the Little Tokyo Branch Library (partial take for station plaza). The acquisition could also have an indirect impact to access and on-street parking along 2nd Street used by patrons of those facilities.

The minimal portion of the properties acquired would not result in a significant adverse effect on the buildings or the function of sites associated with public services or religious facilities. Therefore, the construction and operation of the Underground Emphasis LRT Alternative would not have a significant adverse direct or indirect impact on public services or religious facilities. No cumulative impacts would occur from the Underground Emphasis LRT Alternative because no significant direct or indirect adverse impacts would occur.

[2] *The Central Community Police Station of the Central Bureau serves the project area, but is not located within 0.25 miles of the proposed project.*

[3] *There are no LAFD stations located within 0.25 miles of the proposed project, but five stations serve the area (Fire Stations #3, #4, #9, #10, and #11).*

[4] *Temporary construction-related effects.*

5.2.4.2 Access

The Underground Emphasis LRT Alternative alignment would not affect surface traffic or pedestrian circulation except at the intersection of Alameda and 1st Streets, where the LRT alignment would operate at-grade. Consequently, vehicular circulation patterns along downtown streets adjacent to most of the alignment would continue to operate in their current traffic flow patterns.

Future roadway levels of service for this alternative would be the same as the No Build and TSM Alternatives except potentially at the intersection of Alameda and 1st Streets. A vehicular underpass and pedestrian overpass would be proposed at this intersection to separate the heavy traffic volumes along Alameda Street from rail traffic and minimize delays.

The proposed underpass would result in uninterrupted flow along Alameda Street in the north and south directions between 2nd and Temple Streets. In addition, at-grade frontage roads would be provided along both sides of Alameda Street south of the intersection, and on the southbound side of the street north of the intersection to maintain access to adjacent businesses and properties. A full northbound frontage road is infeasible because of the location of the rail tracks and the Little Tokyo/Arts District Station on the east side of Alameda Street. Instead, motorists traveling north along this frontage road would have to make a right turn on 1st Street to get back to 2nd Street for through, northbound travel.

The new underpass at 1st and Alameda Streets may facilitate emergency vehicle travel through the area, thus shortening trip times. For example, fire trucks from LAFD Station #4 would no longer have to negotiate cross-traffic at 1st Street when traveling south on Alameda Street.

The construction and operation of the Underground Emphasis LRT Alternative would occur mostly underground, and therefore significant adverse impacts to vehicle or pedestrian access to public services and religious facilities would not occur. However, construction of the proposed 2nd Street station – Los Angeles Street Option could temporarily modify and potentially affect pedestrian and vehicular access at the site of the new LAPD headquarters, Caltrans, and the Little Tokyo Branch Public Library.

Operation of this station would result in beneficial effects on pedestrian access because it would increase access to these facilities. In addition, no significant adverse impacts to vehicle access would occur. Therefore, the effect on vehicle or pedestrian access to and from public services and religious facilities would not be significant. No cumulative impacts would occur under the Underground Emphasis LRT Alternative because no direct or indirect significant adverse impacts would occur.

5.2.4.3 Parking

The proposed alignment for this alternative would be mostly underground, and thus would result in the loss of only a few on-street public parking spaces along Flower and Alameda Streets. The proposed underpass at 1st and Alameda Streets would result in the loss of 10 existing on-street parking spaces along the east side of Alameda Street near the intersection, including three bus tour loading spaces on the west side of the street. Approximately 20 on-street spaces would be displaced by this reconfiguration.

Construction of the Underground Emphasis LRT Alternative would temporarily displace parking spaces along the alignment for the duration of construction in discrete locations. In particular, construction of the proposed 2nd Street station – Los Angeles Street Option could temporarily modify and affect on-street parking along 2nd Street in the vicinity of the Caltrans building, new LAPD Headquarters, and Little Tokyo Branch Public Library.

If the proposed station requires modification of on-street parking during operation of the alternative, the loss of on-street parking would be minimal and not significant due to the low number of spaces being taken and availability off-street parking in the area. In addition, potential parking access impacts of the project would be balanced by an increase in non-automobile-related access that would be provided by the new transit system to the Little Tokyo Branch Public Library. Therefore, no direct or indirect potential impacts to public services or religious facilities would occur due to changes in available on-street parking.

No cumulative impacts would occur under the Underground Emphasis LRT Alternative because no direct or indirect significant adverse impacts would occur.

5.2.4.4 Design Options

The Underground Emphasis LRT Alternative includes the following two design options:

- 2nd Street station – Broadway Option: This option would include an underground station on 2nd Street between Broadway and Spring Street.
- 2nd Street station –Los Angeles Street Option: This option would include an underground station on 2nd Street between Main and Los Angeles Streets.

The 2nd Street station – Broadway Option has the potential to result in a direct impact (i.e., easement) to a portion of the new LAPD headquarters property. The 2nd Street – Los Angeles Street option would require acquisition of a temporary easement from a portion of the new LAPD headquarters, Caltrans building, and a small plaza area adjacent to the Little Tokyo Branch Library (both permanent partial takes). The direct impacts would not be significant and would not affect the function of the services provided to the public. Construction and operation of the Underground Emphasis LRT Alternative would cause no significant direct or indirect adverse impacts to public services or religious facilities due to acquisition, access, or parking associated with the two design options.

5.2.5 Fully Underground LRT Alternative – Little Tokyo Variation 1 and Fully Underground LRT Alternative – Little Tokyo Variation 2

Table 5-6 summarizes the potential impacts to public services and religious facilities located within 0.25 mile of Fully Underground LRT Alternative – Little Tokyo Variations 1 and 2. The routes of these alternatives are entirely underground, and no at-grade crossings would be constructed.

5.2.5.1 Acquisition

The Fully Underground LRT Alternatives would require acquisition of private property for additional right-of-way. The tracks on 2nd Street would veer north to a new station located beneath private property on the block bounded by Central Avenue, Alameda Street, 1st Street, and 2nd Street. This block is currently occupied entirely by retail and restaurant businesses.

Metro has identified the entire block for acquisition to stage construction and build a new underground station, station entrances, and ancillary facilities. This block is one of two possible launching sites being considered for the tunnel boring machines and transporting material from the tunnels. Metro intends to maintain the existing businesses acquired along Central Avenue between 1st and 2nd Streets that are not directly impacted by construction activities, except for Café Cuba and potentially Starbucks. Acquisition of this block would represent a worst-case scenario. However, no impacts to public services or religious facilities would occur.

Acquisition on this block may be reduced based on further engineering analysis during the preliminary engineering and final design stages. No additional impacts to public services or religious facilities would occur.

Acquisition of part of the vacant parcel on the northeast corner of 1st and Alameda Streets would be needed for tunnel and portal construction. The Fully Underground LRT Alternative – Little Tokyo Variation 2 would also require acquisition of small vacant portions of two parcels on the south side of 1st Street between Hewitt and Garey Streets. None of these acquisitions would affect or impede access to any public services or religious facilities.

Property acquisition could be needed for pedestrian entrances to stations on Flower Street north of 5th Street, southwest of the intersection of 2nd and Hope Streets, and on 2nd Street between Broadway and Spring Street. Construction staging for the 2nd Street/Broadway station could potentially result in a temporary direct impact (i.e., easement) to a portion of the new LAPD headquarters property. The acquisition could also have an indirect impact to access and on-street parking along 2nd Street used by people traveling to the headquarters.

The portion of the properties acquired would not result in a significant adverse effect on the buildings or the function of the sites associated with public services or religious facilities. Therefore, construction and operation of the Fully Underground LRT Alternative – Little Tokyo Variations 1 or 2would not have a significant adverse direct or indirect impact on public services or religious facilities. No cumulative impacts would occur from either alternative because no significant direct or indirect adverse impacts would occur.

[4] *Temporary construction-related effects.*

5.2.5.2 Access

The alignment of both Fully Underground LRT Alternatives would not affect surface traffic or pedestrian circulation except at the intersection of 1st and Hewitt Streets, where the LRT alignments would prevent pedestrians and automobiles from crossing 1st Street. This may affect routes that visitors take to Nishi Hongwanji Temple. However, alternative access would be available (Vignes Street), and this one-block detour would not significantly impede access to the Temple.

Overall, vehicular circulation patterns along downtown streets adjacent to most of the alignment would continue to operate as they currently do. The future roadway levels of service for these alternatives would be the same as the No Build and TSM alternatives.

Most of the construction and operation of these two alternatives would occur underground, and significant adverse impacts to vehicle or pedestrian access to public services or religious facilities would not occur. However, construction of the proposed 2nd/Broadway station could temporarily modify and potentially affect pedestrian and vehicular access at the new LAPD headquarters site. Operation of this station would result in beneficial effects because it would increase access for pedestrian use.

There would be no significant adverse impacts to vehicle access. Therefore, the effect on vehicle or pedestrian access to and from public services and religious facilities would not be significant. No cumulative impacts would occur with either alternative because no direct or indirect significant adverse impacts are would occur.

5.2.5.3 Parking

Parking impacts of the Fully Underground LRT Alternative – Little Tokyo Variations 1 and 2 would be identical to the Underground Emphasis LRT Alternative except in the vicinity of 1st and Alameda Streets. Here, no curb parking spaces would be removed because the two Fully Underground LRT Alternatives would not include an underpass or pedestrian bridge and the three bus tour loading spaces on the west side of Alameda would not be permanently displaced. Therefore, a total of approximately 7 on-street spaces would be displaced by the Fully Underground LRT Alternatives.

The loss of on-street parking would be minimal and not significant due to the low number of spaces being taken and available off-street parking in the area. In addition, potential parking access impacts of the project would be balanced by an increase in non-automobile-related access provided by the new transit system to the adjacent library.

Therefore, no direct or indirect potential impacts to public services or religious facilities would occur due to changes in available on-street parking. No cumulative impacts would occur under either alternative because there would be no direct and indirect significant adverse impacts.

5.3 Educational Facilities

5.3.1 No Build Alternative

The No Build Alternative would maintain existing transit service through the year 2035. No new transit infrastructure would be built aside from projects currently under construction or identified in Metro's *2009 Long Range Transportation Plan*. Therefore, educational facilities within the corridor would not be affected by the No Build Alternative.

The No Build Alternative would not result in significant adverse impacts on educational facilities. No cumulative impacts would occur under the No Build Alternative because no significant direct and indirect adverse impacts would occur.

5.3.2 TSM Alternative

The TSM Alternative would include provisions of the No Build Alternative and add two shuttle bus routes to provide a link between 7th Street/Metro Center and Union Stations. The Upper Grand Shuttle Bus Route would be along Grand Avenue and Temple and Los Angeles Streets, and the Lower Grand Shuttle Bus Route would be along Figueroa, Flower, 2nd, 3rd, and Alameda Streets. Shuttle buses would use existing bus-only lanes, where available, and peak hour bus-only lanes would be created where possible by restricting parking on streets that do not already have dedicated all-day bus lanes.

Stops would be located every two or three blocks to provide adequate coverage of the project service area. As show on Figure 4-7, the TSM Alternative would be operated within public rights-of-way (i.e., streets).

Improvements associated with the TSM Alternative would require very minimal construction. Additional buses would not have a significant adverse impact on educational facilities; therefore, construction and operation of the TSM Alternative would not have significant direct or indirect impacts on educational facilities. In addition, the TSM Alternative would not have adverse direct or indirect impacts on Section 4(f) resources (i.e., public school facility opened for public recreation). No cumulative impacts would occur under the TSM Alternative because no significant direct or indirect adverse impacts would occur.

5.3.3 At-Grade Emphasis LRT Alternative

Table 5-7 summarizes potential impacts to educational facilities located within 0.25 miles of the At-Grade Emphasis LRT Alternative. This alternative would use a combination of at-grade and underground tracks along Temple, Main, Los Angeles, 2nd, and Flower Streets.

5.3.3.1 Acquisition

The At-Grade Emphasis LRT Alternative would require partial or full acquisition of properties for the tracks along the alignment, at-grade stations, and portals to the underground stations. This alternative's alignment would reduce the 2nd Street tunnel from four lanes to a minimum of one lane (potentially two lanes, pending further detailed engineering).

One travel lane and both parking lanes would be removed along 2nd Street to Los Angeles Street, which would leave a single travel lane, primarily for access to parking lots and loading zones. In addition, new right-of-way would be needed for the at-grade double tracks on Flower Street between 4th and 3rd Streets, including the intersection at 3rd and Flower Streets, and on Temple Street between Los Angeles and Alameda Streets.

Proposed at-grade single tracks would require additional right-of-way on Main and Los Angeles Streets between 2nd and Temple Streets, and on Temple and 2nd Streets between Main and Los Angeles Streets. Additional right-of-way would be required for the proposed

pedestrian entrances to stations on Flower Street south of 5th Street and southwest of 2nd and Hope Streets. In addition, the at-grade stations on Main Street north of 1st Street and on Los Angeles Street north of 1st Street would require acquisition of additional right-of-way.

The At-Grade Emphasis LRT Alternative would not result in a direct or indirect acquisition or easement impact to an educational facility. Therefore, construction and operation of the At-Grade Emphasis LRT Alternative would not have significant direct or indirect adverse impact related to acquisitions or easements on educational facilities.

No impact to a Section 4(f) resource (i.e., schools open to the public for recreation) would occur because there is no proposed direct or indirect impact on an educational facility. No cumulative impacts would occur under the At-Grade Emphasis LRT Alternative because no significant direct or indirect adverse impacts would occur.

Table 5-7. Educational Facilities Within 0.25 Miles of the Proposed At-Grade Emphasis LRT Alternative

Map No[1]	Name	Location	Proximity to Alignment (miles)	Within ¼ mile of station	Land Acquisition	Loss of street parking	Affect vehicle access	Barrier to Pedestrian Access

[1] Map numbers correspond to Figure 4-10.
[2] Temporary construction-related effects.

5.3.3.2 Access

For the at-grade segments vehicular and pedestrian crossings would be limited to traffic signal-controlled intersections. Signal phasing would be modified to provide adequate green time for the LRT vehicles to cross safely. For safety reasons, no uncontrolled mid-block vehicular crossings of the tracks would be permitted.

Access to existing parking structures, parking lots, loading docks, and commercial frontage would be affected by the at-grade LRT facilities. Left-turn parking ingress and egress is presently allowed at many downtown sites. However, the at-grade LRT facilities would eliminate uncontrolled mid-block left-turns, and thus modify existing approach and departure traffic patterns.

The proposed At-Grade Emphasis LRT alignment travels at-grade along 2nd Street, and it is assumed that this street would be dedicated as a transit-only roadway between the 2nd Street tunnel and Los Angeles Street. This segment of 2nd Street would be closed to through traffic and provide only emergency vehicle access and local access to adjacent properties.

This alternative includes a vehicular underpass and pedestrian overpass along Alameda Street to avoid potential conflicts between rail, vehicular, and pedestrian traffic, and minimize delays at the intersection of Temple and Alameda Streets,. Through traffic on Alameda Street would operate unimpeded without being stopped or delayed at the intersection. In addition, a one-lane, southbound, at-grade frontage road would be provided along Alameda Street to maintain access to the businesses and properties on the west side of the street.

Construction of the Alameda Street underpass under the At-Grade Emphasis LRT Alternative would potentially impact (directly and indirectly) pedestrian and vehicle access to the U.S. Federal Government Building (Roybal Center), which contains the H. Pregerson Child Care Center. In addition, construction of the couplet station along Main Street would potentially impact (directly and indirectly) pedestrian and vehicle access to the Tiny DOTs – Early Education Center and pedestrian access to Joy Picus Child Development Center. Potential impacts would be temporary (during construction) and are not considered significant.

Operation of the LRT and station along Main Street could potentially impact vehicle access to the Joy Picus Child Development Center. However, the alignment would only consist of a single LRT track and a couplet station along the roadway. Main Street is wide enough to accommodate the single track and maintain acceptable vehicular circulation. Therefore, impacts associated with vehicle access to the Joy Picus Child Development Center would be less than significant.

No adverse impact to a Section 4(f) educational resource would occur because no direct or indirect impacts on educational facilities would occur. No cumulative impacts would occur under the At-Grade Emphasis LRT Alternative because there would be no significant direct or indirect adverse impacts.

5.3.3.3 Parking

Construction of at-grade tracks along 2nd Street and the need for adequate street widths to provide local access lanes would eliminate existing on-street parking and loading spaces. This loss of parking may result in spillover to adjacent streets if parking on those streets is readily available.

The number of parking spaces potentially lost under the At-Grade Emphasis LRT Alternative would total 80, with 28 of those spaces located on 2nd Street between Hill and Los Angeles Streets. Recent restriping by the City of Los Angeles to incorporate left-turn pockets has reduced the number of parking spaces potentially lost under this project alternative. All of the parking spaces potentially lost would be in the Civic Center area. No on-street parking would be displaced in the community of Little Tokyo.

Twelve spaces would also be lost along the south side of Temple Street west of Alameda Street due to the proposed underpass. Mitigation measures would be considered, including providing off-street parking facilities to replace the lost curb spaces.

Construction and operation of the At-Grade Emphasis LRT Alternative would potentially impact on-street parking that could be used to access the U.S. Federal Government Building (Roybal Center), which contains the H. Pregerson Child Care Center, Joy Picus Child Development Center, and the Tiny DOTs – Early Education Center. The availability of various nearby off-street parking options throughout the project area would result in this impact being not adverse or significant. Furthermore, operation of the proposed project could be beneficial by providing enhanced transit access to the child care centers.

No adverse impact to a Section 4(f) educational resource would occur because there would be no direct or indirect impacts on educational facilities.

Reasonably foreseeable related actions/projects (potential projects under construction at the same time as the proposed alternative - years 2014 to 2018) are in the vicinity of the H. Pregerson Child Care Center and could cause direct and indirect impacts to the Children's Museum and Art Park, which is proposed across Temple Street from the U.S. Federal Government Building (Roybal Center). The off-street parking lot that could be eliminated by the proposed new museum is not a public lot, and potential direct or indirect impacts on parking for the child care center would not be significant. Therefore, cumulative impacts would not be significant under the At-Grade Emphasis LRT Alternative.

5.3.4 Underground Emphasis LRT Alternative

Table 5-8 summarizes potential impacts to educational facilities located within 0.25 miles of the Underground Emphasis LRT Alternative. This alternative would have a single at-grade crossing at the intersection of 1st and Alameda Streets. The rest of the route would be constructed underground.

5.3.4.1 Acquisition

The Underground Emphasis LRT Alternative would require acquisitions of private property for additional right-of-way. The alignment would have a single at-grade crossing at the intersection of 1st and Alameda Streets. The tracks on 2nd Street would veer north through a new portal; therefore, acquisition of a portion of the block bounded by Central Avenue, Alameda, 1st, and 2nd Streets would be required. The properties at this intersection are currently occupied entirely by retail and restaurant businesses. No other right-of-way acquisitions would be needed for the LRT tracks because the rest of the route would be underground. The Underground Emphasis LRT Alternative would also require acquisitions for pedestrian entrances to stations on Flower Street north of 5th Street, southwest of the

intersection of 2nd and Hope Streets, and on 2nd Street either between Broadway and Spring Street or between Main and Los Angeles Streets.

The Underground Emphasis LRT Alternative would not result in direct or indirect acquisition-related impacts to educational facilities. Therefore, the construction and operation of the Underground Emphasis LRT Alternative would not have significant direct or indirect impacts on educational facilities related to acquisitions and easements.

No adverse impacts to a Section 4(f) educational resource (schools open to the public for recreation) would occur because this alternative would have no direct or indirect impacts on educational facilities. No cumulative impacts would occur under the Underground Emphasis LRT Alternative because there would be no significant direct or indirect adverse impacts.

Table 5-8. Educational Facilities Within 0.25 Miles of the Proposed Underground Emphasis LRT Alternative

Source: CDM 2009

[1] *Map numbers correspond to Figures 4-11.*

[2] *Temporary construction-related effects.*

5.3.4.2 Access

Construction of Underground Emphasis LRT Alternative – Los Angeles Street Station option along 2nd Street could potentially impact (directly and indirectly) pedestrians and vehicles traveling northbound, from areas south of 2nd Street, to the Tiny DOTs – Early Education

Center. Potential impacts would be temporary (during construction) and are not considered significant.

The Underground Emphasis LRT Alternative alignment would not affect surface traffic or pedestrian circulation except at the intersection of Alameda and 1st Streets, where the LRT alignment operates in an at-grade configuration. Consequently, vehicular circulation patterns along downtown streets adjacent to most of the alignment would continue to operate as they do today.

Future roadway levels of service for this alternative would be the same as the No Build and TSM alternatives except at the intersection of Alameda and 1st Streets, where a vehicular underpass and pedestrian overpass are proposed. The proposed underpass would result in uninterrupted flow along Alameda Street between 2nd and Temple Streets. In addition, at-grade frontage roads would be provided along both sides of Alameda Street south of the intersection, and on the southbound side of the street north of the intersection, to maintain access to adjacent businesses and properties. A full northbound frontage road is not feasible because of the location of the rail tracks and the Little Tokyo/Arts District Station on the east side of Alameda Street.

The Underground Emphasis LRT Alternative would not result in significant direct or indirect adverse access impacts to an educational facility. Therefore, construction and operation of this alternative would not have a significant adverse impact.

There would be no adverse impact to Section 4(f) resources (schools open to the public for recreation) because there is no proposed direct or indirect impact on educational facilities. No cumulative impacts would occur under the Underground Emphasis LRT Alternative because there would be no significant direct or indirect adverse impacts.

5.3.4.3 Parking

The proposed Underground Emphasis LRT Alternative alignment is mostly underground, and would result in the loss of seven on-street public parking spaces along Flower Street. The proposed underpass at 1st and Alameda Streets would result in the loss of 10 on-street parking spaces along the east side of Alameda Street near the intersection, including three bus tour loading spaces. Approximately 20 on-street spaces would be displaced.

Construction of the Underground Emphasis LRT Alternative would temporarily displace parking spaces along the alignment for the duration of construction in discrete locations. This would not be a significant adverse effect on street parking for educational facilities because the alignment for this alternative would be mostly underground.

The Underground Emphasis LRT Alternative would not result in significant direct or indirect adverse impacts to on-street parking associated with educational facilities. Therefore,

construction and operation of this alternative would not have an adverse or significant impact.

No adverse impacts to a Section 4(f) resource (schools open to the public for recreation) would occur because the Underground Emphasis LRT Alternative would not result in direct or indirect impacts on educational facilities. No cumulative impacts would occur under the Underground Emphasis LRT Alternative because there would be no significant direct or indirect adverse impacts.

5.3.4.4 Design Options

The Underground Emphasis LRT Alternative includes the following two design options:

- 2nd Street station – Broadway Option: This option would include an underground station on 2nd Street between Broadway and Spring Street.
- 2nd Street station –Los Angeles Street Option: This option would include an underground station on 2nd Street between Main and Los Angeles Streets.

The two design options would not significantly affect educational facilities by acquisitions or easements, changes in vehicle or pedestrian access, or on-street parking. Therefore, there would be no impacts. In addition, these design options would not have a direct or indirect adverse impact on access and parking to Section 4(f) lands. No cumulative impacts would occur under the design options for the Underground Emphasis LRT Alternative because there would be no direct or indirect adverse impacts.

5.3.5 Fully Underground LRT Alternative – Little Tokyo Variation 1 and Fully Underground LRT Alternative – Little Tokyo Variation 2

Table 5-9 summarizes the potential impacts to educational facilities located within 0.25 miles of the Fully Underground LRT Alternative – Little Tokyo Variations 1 and 2. Both alternatives would be completely underground, and no at-grade crossings would be required.

5.3.5.1 Acquisition

The Fully Underground LRT Alternatives would require acquisition of private property for additional right-of-way. The tracks on 2nd Street would veer north through a new station located beneath private property on the block bounded by Central Avenue, Alameda Street, 1st Street, and 2nd Street. This block is currently occupied entirely by retail and restaurant businesses.

Metro has identified this entire block for acquisition to stage construction and build a new underground station, station entrances, and ancillary facilities. Metro may also use the site to launch tunnel boring machines and transport material from the tunnels.

Metro intends to maintain some of the businesses acquired on Central Avenue between 1st and 2nd Streets that are not directly impacted by construction activities. This would represent a worst-case scenario. However, no impacts to educational facilities would occur. Potential reductions in acquisition on this block may occur based on further engineering analysis during the preliminary engineering and final design stages.

Acquisition of part of the vacant parcel on the northeast corner of 1st and Alameda Streets would be needed for tunnel and portal construction under both alternatives. The Fully Underground LRT Alternative – Little Tokyo Variation 2 would also require acquisition of small vacant portions of two parcels on the south side of 1st Street between Hewitt and Garey Streets. None of these acquisitions would affect or impede access to any educational facilities. Both alternatives would require property acquisition for pedestrian entrances to stations on Flower Street north of 5th Street, southwest of the intersection of 2nd and Hope Streets, and on 2nd Street between Broadway and Spring Street.

Neither of the Fully Underground LRT Alternatives would result in direct or indirect acquisition-related impacts to educational facilities. Therefore, construction and operation would not have significant direct or indirect impacts related to acquisitions or easements on educational facilities.

There would be no adverse impacts to Section 4(f) educational resources (schools open to the public for recreation) because there would be no direct or indirect impact on educational facilities. No cumulative impacts would occur under either alternative because no significant direct or indirect adverse impacts would occur.

Source: CDM 2009
[1] Map numbers correspond to Figures 4-12
[2] Temporary construction-related effects

5.3.5.2 Access

The Fully Underground LRT Alternative – Little Tokyo Variations 1 and 2 alignments would not affect surface traffic or pedestrian circulation except at the intersection of 1st and Hewitt Streets. Here, the LRT alignment would prevent automobile and pedestrian traffic from crossing 1st Street. An alternative crossing would remain one block east at Vignes Street.

Vehicular circulation patterns along downtown streets adjacent to most of the alignment would continue to operate as it does currently. Future roadway levels of service for this alternative would be the same as the No Build and TSM alternatives.

Fully Underground LRT Alternative – Little Tokyo Variations 1 and 2 would not result in significant direct or indirect adverse impacts to educational facility access. Therefore, construction and operation of the two alternatives would not have significant adverse impacts.

There would be no adverse impacts to a Section 4(f) resource (schools open to the public for recreation) because there would be no direct or indirect impacts on educational facilities.

No cumulative impacts would occur under the Fully Underground LRT Alternative – Little Tokyo Variations 1 and 2 because there would be no significant direct or indirect adverse impacts.

5.3.5.3 Parking

The alignment for, Fully Underground LRT Alternative – Little Tokyo Variations 1 and 2 is entirely underground. Both alternatives would result in the loss of seven on-street public parking spaces along Flower Street. Therefore, there would not be a significant adverse effect on educational facilities from on-street parking loss. Neither alternative would result in significant direct or indirect adverse impacts to on-street parking for educational facilities. Therefore, construction and operation of the alternatives would not have adverse or significant impacts.

There would be no adverse impacts to Section 4(f) resources (schools open to the public for recreation) under either alternative because there would be no direct or indirect impacts on educational facilities. No cumulative impacts would occur under either alternative because there would be no significant direct or indirect adverse impacts.

6.0 POTENTIAL MITIGATION MEASURES

No adverse construction or operational impacts to parklands and other community facilities have been identified, and the project would comply with applicable regulations. Therefore, no mitigation measures would be required. However, permanent replacement bus loading spaces should be identified near the Japanese American National Museum for the At-Grade Emphasis LRT Alternative and the Underground Emphasis LRT Alternative. Temporary replacement spaces should be identified for the Fully Underground LRT Alternatives during construction. Additional information on potential parking impacts and potential mitigation measures are detailed in the Transportation Technical Memorandum.

7.0 CONCLUSIONS

7.1 Parklands and Recreational Resources

NEPA does not have specific thresholds related to potential impacts on parklands and community facilities. However, Section 4(f) of the U.S. Department of Transportation Act of 1966 requires protection of some parklands and community facilities, as specified in the regulation. The standards of significance for impacts to Section 4(f) resources are discussed in this memorandum. Based on the *L.A. CEQA Thresholds Guide,* Section 3.2 lists significance thresholds for impacts to parklands and recreational resources.

7.1.1 No Build Alternative

7.1.1.1 NEPA Findings

The No Build Alternative would not to result in an adverse impact on parklands and recreational resources.

7.1.1.2 CEQA Determinations

The No Build Alternative would maintain existing transit service through the year 2035. No new transit infrastructure would be built aside from projects currently under construction or identified in Metro's *2009 Long Range Transportation Plan*. Therefore, the No Build Alternative would not affect parklands and recreational resources in the project area.

The No Build Alternative would not result in significant adverse physical impacts. Potential impacts could occur if there was a need to provide new or physically altered parks. However, the No Build Alternative would not increase the use of existing neighborhood and regional parks or other recreational facilities to the extent that substantial physical deterioration of the facility would occur or be accelerated. The No Build Alternative would not require construction or expansion of parklands and recreational resources that might have a physical impact on the environment. The No Build Alternative would not have the beneficial impact of increasing non-auto access to recreational facilities throughout the region, including to and from downtown.

7.1.2 TSM Alternative

7.1.2.1 Section 4(f) and NEPA Findings

The TSM Alternative would be operated within existing public right-of-way (i.e., streets) and would not have a significant adverse impact on parklands, recreational resources, or Section 4(f) resources.

7.1.2.2 CEQA Determinations

The TSM Alternative would include provisions of the No Build Alternative and would add two shuttle bus routes to provide a transit link between 7th Street/Metro Center and Union Stations. This alternative would not result in significant physical impacts that might otherwise occur if there were a need to provide new or physically altered parks.

The TSM Alternative would not increase use of existing neighborhood and regional parks or other recreational facilities to the extent that substantial physical deterioration of the facility would occur or be accelerated. The TSM Alternative does not affect parklands and recreational resources or require construction or expansion of parklands and recreational resources.

7.1.3 At-Grade Emphasis LRT Alternative

7.1.3.1 Section 4(f) and NEPA Findings

The At-Grade Emphasis LRT Alternative would not result in direct impacts to parkland or recreational facilities. During construction there would be potential indirect and temporary impacts to vehicle and pedestrian access at the Maguire Gardens (a public facility) and City Hall South Lawn Park (a designated park). However, the impacts would be temporary and would not significantly affect the amenities or access associated with either site. Therefore, there would be no adverse impacts to Section 4(f) resources.

7.1.3.2 CEQA Determinations

The proposed At-Grade Emphasis LRT Alternative would have the beneficial effect of situating public transit adjacent to parklands and recreational resources and thereby potentially increasing the public's ability to visit them. As shown in Table 4-1, five parks are within 0.25 miles of the proposed alignment.

Although the proposed At-Grade Emphasis LRT Alternative would potentially make these parklands more accessible, this would not create a demand on parklands to the extent that they would need to be expanded or have new facilities constructed. Therefore, the At-Grade Emphasis LRT Alternative would not result in significant physical impacts that might occur if there were a need for new or physically altered parks.

The At-Grade Emphasis LRT Alternative would not increase use of existing neighborhood and regional parks or other recreational facilities to the extent that substantial physical deterioration of the facility would occur or be accelerated. The At-Grade Emphasis LRT Alternative does not affect parklands or recreational resources, or require construction or expansion of parklands or recreational resources that might otherwise have a physical impact on the environment.

In conclusion, no significant impact to parklands or recreational resources would occur from construction and operation of the At-Grade Emphasis LRT Alternative.

7.1.4 Underground Emphasis LRT Alternative

7.1.4.1 Section 4(f) and NEPA Findings

The Underground Emphasis LRT Alternative would not result in direct or indirect impacts (i.e., acquisition or easement) to any parkland or recreational resource. Therefore, no significant adverse impact would occur. Additionally, because there would be no significant adverse impacts, there would be no adverse impact to Section 4(f) resources.

7.1.4.2 CEQA Determinations

The proposed Underground Emphasis LRT Alternative would have the beneficial effect of situating public transit adjacent to parklands and recreational resources and thereby potentially increasing accessibility to these resources. As shown in Table 4-1, four parks are within 0.25 miles of the proposed alignment.

The proposed Underground Emphasis LRT Alternative would potentially make these parklands more accessible, but not to an extent that parklands would need to be expanded or new facilities constructed. Therefore, this alternative would not result in significant physical impacts that might otherwise occur if there were a need for new or physically altered parks.

The Underground Emphasis LRT Alternative would not increase use of existing neighborhood and regional parks or other recreational facilities to the extent that substantial physical deterioration of the facility would occur or be accelerated. The Underground Emphasis LRT Alternative does not affect parklands or recreational resources, or require the construction or expansion of parklands or recreational resources, that might otherwise have a physical impact on the environment.

In conclusion, no significant impact to parklands or recreational resources would occur from construction and operation of the Underground Emphasis LRT Alternative.

7.1.4.3 Design Options

The two station design options would not result in significant adverse physical impacts that might occur if there were a need for new or physically altered parks. These options would not increase use of existing neighborhood and regional parks or other recreational facilities to the extent that substantial physical deterioration of the facility would occur or be accelerated. Neither option would affect parklands and recreational resources or require construction or expansion of parklands and recreational resources that might otherwise have a physical impact on the environment.

In conclusion, no significant impact to parklands or recreational resources would occur from either Underground Emphasis LRT Alternative design option.

7.1.5 Fully Underground LRT Alternative – Little Tokyo Variation 1 and Fully Underground LRT Alternative – Little Tokyo Variation 2

7.1.5.1 Section 4(f) and NEPA Findings

Fully Underground LRT Alternative – Little Tokyo Variations 1 and 2 would not result in direct or indirect impacts (i.e., acquisition or easement) to any parkland or recreational resource. Therefore, because there would be no significant adverse impacts with these alternatives, there would be no adverse impact to Section 4(f) resources. .

7.1.5.2 CEQA Determinations

The two alternatives would have the beneficial effect of situating public transit adjacent to parklands and recreational resources, thereby potentially increasing the public's ability to visit them. As shown in Table 4-1, four parks are within 0.25 miles of the proposed alignment.

Although the proposed alternatives would potentially make these parklands more accessible, they would not create a demand to the extent that parklands would need to be expanded or new facilities constructed. Therefore, neither of the Fully Underground LRT Alternative – Little Tokyo variations would result in significant physical impacts that might otherwise occur if there were a need for new or physically altered parks.

Neither alternative would increase the use of existing neighborhood and regional parks or other recreational facilities to the extent that substantial physical deterioration of the facility would occur or be accelerated. Neither alternative would affect parklands and recreational resources or require construction or expansion of parklands and recreational resources that might otherwise have a physical impact on the environment.

In conclusion, no significant impact to parklands and recreational resources would occur from construction and operation of either Fully Underground LRT Alternative – Little Tokyo variations.

7.2 Public Services and Religious Facilities

NEPA does not have specific thresholds related to potential impacts on public services and religious facilities. Significance thresholds from the *L.A. CEQA Thresholds Guide* that address impacts to public facilities are identified in Section 3.

7.2.1 No Build Alternative

7.2.1.1 NEPA Findings

The No Build Alternative would not result in significant adverse impacts on public services and religious facilities.

7.2.1.2 CEQA Determinations

The No Build Alternative would maintain existing transit service through the year 2035. No new infrastructure would be built, aside from projects currently under construction or identified in Metro's *2009 Long Range Transportation Plan*. Therefore, the No Build Alternative would not affect public services and religious facilities in the project area. In addition, the No Build Alternative would not result in significant physical impacts.

Potential impacts could occur if new or physically altered governmental facilities were required to maintain acceptable service ratios, response times, or other performance objectives for police protection, fire protection, and other public services. The No Build Alternative would not physically affect an adopted emergency response plan or evacuation plan, nor would it expose people or structures to a significant risk of loss, injury, or death.

7.2.2 TSM Alternative

7.2.2.1 NEPA Findings

The TSM Alternative would be operated within existing public right-of-way (i.e., streets) and would not have significant adverse impacts on public services or religious facilities.

7.2.2.2 CEQA Determinations

The TSM Alternative would include the provisions of the No Build Alternative and would add two shuttle bus routes to provide a transit link between 7th Street/Metro Center and Union Stations. The TSM Alternative would not result in significant physical impacts that might otherwise occur if new or physically altered governmental facilities were required to maintain acceptable service ratios, response times, or other performance objectives for police protection, fire protection, and other public services.

The TSM Alternative would not physically affect an adopted emergency response plan or evacuation plan, nor would it expose people or structures to a significant risk of loss, injury, or death. The TSM Alternative would also not significantly impact religious facilities in the project area.

7.2.3 At-Grade Emphasis LRT Alternative

7.2.3.1 NEPA Findings

Several public service or religious facilities could experience potential impacts during construction of the At-Grade Emphasis LRT Alternative. However, the impacts would be temporary and not significant.

7.2.3.2 CEQA Determinations

As shown in Table 4-1, the At-Grade Emphasis LRT Alternative would not displace existing public services or religious facilities, including police and fire services or other public facilities,

nor would it hinder access to these facilities. This alternative would provide increased access to existing public service and religious facilities, but not to the extent that would require new or expanded services or facilities, or interfere with response times of police and fire service providers.

The At-Grade Emphasis LRT Alternative could potentially affect emergency vehicle routes in the vicinity of Temple and Alameda Streets, particularly trucks coming from LAFD Station #4. However, Metro would coordinate with LAFD to minimize or avoid impacts to emergency vehicle response times. This alternative would not expose people or structures to any significant risk of loss, injury, or death.

The At-Grade Emphasis LRT Alternative would not result in a need for new or expanded public services or hinder implementation of an emergency response plan. Therefore, the potential impact on public service facilities would be less than significant.

7.2.4 Underground Emphasis LRT Alternative

7.2.4.1 NEPA Findings

Although most of construction and operation of the Underground Emphasis LRT Alternative would be underground, several public service facilities could experience potential impacts during construction. These impacts, however, would be temporary and not significant.

7.2.4.2 CEQA Determinations

As shown in Table 4-1, the Underground Emphasis LRT Alternative would not displace existing public services or religious facilities, including police or fire services or other public facilities, nor would it hinder access to these facilities. The Underground Emphasis LRT Alternative would provide increased access to existing public service and religious facilities, but would not generate a need for new or expanded services or facilities or interfere with response times of police and fire service providers.

The Underground Emphasis LRT Alternative would not affect adopted emergency response plans or emergency evacuation plans, nor would it expose people or structures to a significant risk of loss, injury, or death. This alternative may improve response times for emergency vehicles traveling on Alameda Street through the intersection with 1st Street because traffic would be grade separated.

The Underground Emphasis LRT Alternative would not require new or expanded public services or hinder implementation of an emergency response plan. Therefore, the potential impact on public service facilities would be less than significant.

7.2.4.3 Design Options

The two Underground Emphasis LRT Alternative station design options would not displace or hinder access to existing public services or religious facilities, including police or fire services or other public facilities. In addition, these options would not affect adopted emergency response plans or emergency evacuation plans, nor would they expose people or structures to a significant risk of loss, injury, or death.

The two Underground Emphasis LRT Alternative options would not require new or expanded public services or hinder implementation of an emergency response plan. Therefore, potential impacts on public service facilities would be less than significant.

7.2.5 Fully Underground LRT Alternative – Little Tokyo Variation 1 and Fully Underground LRT Alternative – Little Tokyo Variation 2

7.2.5.1 NEPA Findings

Although most construction and operation of the Fully Underground LRT Alternative – Little Tokyo Variations 1 and 2 would be underground, several public service facilities could experience potential impacts during construction. However, the impacts would be temporary and not significant.

7.2.5.2 CEQA Determinations

As shown in Table 4-1, neither of the Fully Underground LRT alternatives would displace existing public services or religious facilities, including police or fire services or other public facilities, nor would they hinder access to these facilities. The two alternatives would provide increased access to existing public service and religious facilities, but not to the extent that would require new or expanded services or facilities or interfere with response times of police and fire service providers.

Neither Fully Underground LRT Alternative – Little Tokyo Variations 1 or 2 would affect adopted emergency response plans or emergency evacuation plans, nor would they expose people or structures to a significant risk of loss, injury, or death. No effects on emergency vehicle response times are anticipated.

Neither alternative would require new or expanded public services or hinder implementation of an emergency response plan. Therefore, potential impacts on public service facilities would be less than significant.

7.3 Educational Facilities

NEPA does not have specific thresholds related to potential impacts on education facilities with the exception of those that meet the requirements of Section 4(f) resources. Significance

thresholds from the *L.A. CEQA Thresholds Guide* that address impacts to educational facilities are identified in Section 3.

7.3.1 No Build Alternative

7.3.1.1 NEPA Findings

The No Build Alternative would not result in significant impacts on educational facilities.

7.3.1.2 CEQA Determinations

The No Build Alternative would maintain existing transit service through the year 2035. No new infrastructure would be built aside from projects currently under construction or identified in Metro's *2009 Long Range Transportation Plan*. Therefore, the No Build Alternative would not affect educational facilities in the project area.

Other transportation projects under Metro's *2009 Long Range Transportation Plan* would undergo project-specific environmental review, as appropriate. The No Build Alternative would not result in significant physical impacts to the area. Potential impacts could occur if new or physically altered educational facilities were required.

7.3.2 TSM Alternative

7.3.2.1 Section 4(f) and NEPA Findings

The TSM Alternative would be operated within existing public right-of-way (i.e., streets) and would not have a significant impact on educational facilities or Section 4(f) resources (i.e., schools used for public recreation).

7.3.2.2 CEQA Determinations

The TSM Alternative would include the provisions of the No Build Alternative and would add two shuttle bus routes to provide a transit link between 7th Street/Metro Center and Union Stations. The TSM Alternative would not result in significant physical impacts that might otherwise occur if new or physically altered educational facilities were required.

7.3.3 At-Grade Emphasis LRT Alternative

7.3.3.1 Section 4(f) and NEPA Findings

A limited number of public facilities could experience potential impacts during construction. However, the impacts would be temporary and not significant.

7.3.3.2 CEQA Determinations

As shown in Table 4-1, the At-Grade Emphasis LRT Alternative would not displace existing educational facilities, nor would it hinder access to these facilities. This alternative would provide increased access to existing education facilities, but not to an extent that new or

expanded education facilities would be required. Potential impacts of the At-Grade Emphasis LRT Alternative on public service facilities would be less than significant because this alternative would not require new or expanded education facilities.

7.3.4 Underground Emphasis LRT Alternative

7.3.4.1 Section 4(f) and NEPA Findings

Most of construction and operation of the Underground Emphasis LRT Alternative would be underground, so potential impacts during construction would be temporary and not significant.

7.3.4.2 CEQA Determinations

As shown in Table 4-1, the Underground Emphasis LRT Alternative would not displace existing educational facilities, nor would it hinder access to these facilities. This alternative would provide increased access to the existing educational facilities, but would not require new or expanded educational facilities. Potential impacts of the Underground Emphasis LRT Alternative on educational facilities would be less than significant because this alternative would not require new or expanded educational facilities.

7.3.4.3 Design Options

The two Underground Emphasis LRT Alternative station design options would not displace or hinder access to and from existing educational facilities. Potential impacts on educational facilities under these two options would be less than significant because they would not require new or expanded educational facilities.

7.3.5 Fully Underground LRT Alternative – Little Tokyo Variation 1 and Fully Underground LRT Alternative – Little Tokyo Variation 2

7.3.5.1 Section 4(f) and NEPA Findings

Most of the construction and operation of Fully Underground LRT Alternative – Little Tokyo Variations 1 and 2 would be underground, and therefore no educational facilities would be affected.

7.3.5.2 CEQA Determinations

As shown in Table 4-1, neither Fully Underground LRT Alternative would displace or hinder access to existing educational facilities. Both alternatives would provide increased access to the existing educational facilities, but not to an extent that would require new or expanded educational facilities. Potential impacts on educational facilities under these two alternatives would be less than significant because they would not require new or expanded educational facilities.

1.0 SUMMARY

The proposed Regional Connector would be built in downtown Los Angeles. The area surrounding the proposed Regional Connector is substantially built out. Therefore, construction and operation of the transit system could result in impacts to land use including displacements. Such land use impacts could create economic and fiscal impacts.

Construction activities may impact local businesses along the project alignment. Construction spending may result in construction-related employment growth, and the Regional Connector Build Alternatives would result in improved accessibility and mobility and from downtown and other parts of the region by train in lieu of car. Increased public investment in infrastructure could result in overall employment growth in the region.

The analysis in this section identified the economic and fiscal impacts associated with construction and operation of the proposed project alternatives. The analysis assessed the significance of the potential impacts of each project alternative.

The project area for purposes of this study is a six-county region (Los Angeles, Orange, Riverside, San Bernardino, Ventura, and Imperial counties). These counties belong to the Southern California Association of Governments (SCAG). The analysis of construction and property tax related impacts focused on properties that would abut the proposed alignments.

The alternatives under consideration for the Regional Connector are: the No Build Alternative, the Transportation Systems Management (TSM) Alternative, the At-Grade Emphasis Light Rail Transit (LRT) Alternative, the Underground Emphasis LRT Alternative, the Fully Underground Alternative – Little Tokyo Variation 1, and the Fully Underground Alternative – Little Tokyo Variation 2.

The No Build Alternative would include transit investments in the Metro 2009 Long-Range Transportation Plan with the exception of the Regional Connector Transit Corridor Project. The No Build Alternative would not substantially alter the physical environment and would not have significant, adverse economic impacts within the project area.

The Transportation System Management (TSM) Alternative includes the same transit improvements as the No Build Alternative and two new shuttles that would connect Union Station with the 7th Street/Metro Center Station. The TSM Alternative could permanently displace up to 24 parking spaces along its alignment to make way for new bus stops. The loss of parking spaces could impact some businesses. It is difficult to estimate the exact impact because the bus station locations have yet to be determined. However, like to the No Build Alternative, the TSM Alternative is not anticipated to have adverse impacts.

The At-Grade Emphasis LRT Alternative would require partial takes of five privately-owned parcels for station site construction and construction staging locations. Takes would result in an approximately 0.85 percent decrease in total property tax revenue from all privately-owned businesses that directly abut the proposed alignment. However, this loss in revenue could be offset by an increase in property values near station sites. Therefore, this alternative would not have an adverse impact to property tax revenues.

Adverse, but temporary, construction-related impacts could occur. Typical impacts could include disruption of access for adjacent land uses, increased levels of noise, vibration and dust, utility disruptions, the permanent displacement of up to 80 parking spaces, and a general disinterest in area businesses due to construction. These impacts could have the secondary effect of reducing area activity levels and, therefore, revenue for adjacent businesses.

Approximately 36 businesses along the At-Grade Emphasis LRT Alternative alignment could be adversely affected by construction. Implementation of mitigation measures, such as compensation to property owners for acquisitions and assistance to business owners, would lessen construction impacts. Depending on the success of mitigation measures, some residual impacts could remain from construction.

The At-Grade Emphasis LRT Alternative is estimated to create approximately 13,800 direct and indirect employment opportunities and generate approximately $1.9 billion in direct and indirect revenues. Such employment projections are consistent with estimated levels of growth for the project area. They would represent beneficial impacts.

The Underground Emphasis LRT Alternative would require acquisition of 20 privately-owned parcels for tunnel boring and station construction. Construction could significantly impact 38 businesses along the alignment due to street and sidewalk closures, the permanent displacement of up to 20 parking spaces, dust, and noise. This alternative proposes a pedestrian underpass and an automobile underpass at the intersection of 1st and Alameda Streets.

Temporary and intermittent street closures for 1st and Alameda Streets throughout the 24-36 month construction process could significantly impact businesses in Little Tokyo. Implementation of mitigation measures, such as compensation to property owners for acquisitions and assistance to business owners, would lessen construction impacts. Depending on the success of mitigation measures, some residual impacts could remain during construction.

With property acquisitions under the Underground Emphasis LRT Alternative, property tax revenues would decrease by 1.2 percent of the property tax base of properties that directly

abut the proposed alignment. This would be a less than significant impact to revenues and offset by property value increases in the vicinity of stations.

This alternative would lead to a $2.8 billion increase in regional economic output and would create 20,700 direct and indirect employment opportunities. This increase in employment opportunities is within projected levels of growth for the project area and would be a beneficial impact. Additionally, new job growth and spending could increase income and sales tax revenues by $117 million.

The Fully Underground LRT Alternative – Little Tokyo Variation 1 would have similar construction impacts to businesses as the Underground Emphasis LRT Alternative. The exception would be businesses near the intersection of 1st and Alameda Streets. Neither a pedestrian overpass nor an automobile underpass would be built there under this alternative; thus, impacts to nearby businesses would be less significant than with the Underground Emphasis LRT Alternative.

However, approximately five businesses along the south side of 1st Street could be significantly impacted by street relocation during construction of the Fully Underground LRT Alternative – Little Tokyo Variation 1. Implementation of mitigation measures, such as compensation to property owners for acquisitions and assistance to business owners, would lessen construction impacts. Depending on the success of mitigation measures, some residual impacts could remain during construction.

The Fully Underground LRT Alternative – Little Tokyo Variation 1 would require removal of fewer parking spaces than the At-Grade Emphasis LRT Alternative and the Underground Emphasis LRT Alternative. Approximately seven parking spaces would be displaced under this alternative. This would cause less than significant impacts to businesses.

Additionally, this alternative would necessitate acquisition of 17 privately-owned parcels. The parcels located on the block bounded by 1st, 2nd and Alameda Streets and Central Avenue would be fully acquired as opposed to partial takes in the Underground Emphasis LRT Alternative. This acquisition is needed to stage construction and build a new underground station, station entrances, and ancillary facilities. However, Metro intends to maintain some of the existing businesses acquired on Central Avenue between 1st and 2nd Streets that would not be directly impacted by construction activities. As a result, property tax loss for the Fully Underground LRT Alternative – Little Tokyo Variation 1 would be slightly higher than the Underground Emphasis LRT Alternative. Property tax revenue losses would still equal 1.2 percent of the property tax base of properties that directly abut the proposed alignment. This loss would be a less than significant impact and offset by property values increases in the vicinity of stations.

Higher capital costs associated with this alternative could induce a total economic output of over $3.2 billion and create 23,500 employment opportunities. This increase in employment opportunities is within projected levels of growth for the project area and would result in a beneficial impact.

The Fully Underground LRT Alternative – Little Tokyo Variation 2 would generally have the same construction and parking displacement impacts to businesses along the alignment as the Fully Underground LRT Alternative – Little Tokyo Variation 1. However, this alternative would require the acquisition of two additional, partial takes of privately-owned parcels on 1st Street between Hewitt and Garey Streets. These takes would be necessary for street widening purposes. This alternative would require a partial take of parcel #5161018020 (see Table 5-4) as opposed to a full take in Fully Underground LRT Alternative – Variation 1.

The total property tax loss associated with this alternative would be 1.1 percent of the total property tax base of properties that directly abut the proposed alignment. Such a loss in revenues would be a less than significant impact. This alternative could create a total economic output of approximate $3.4 billion, including an increase of over $143 million in sales and income taxes. Direct and indirect employment population is estimated to increase by over 25,400 jobs.

This increase in employment opportunities is within projected levels of growth for the project area and economic output would result in a beneficial impact. Mitigation measures for construction-related impacts to local businesses would include compensation to property owners for acquisitions, relocation subsidies for businesses, and assistance to business owners.

2.0 INTRODUCTION

The Regional Connector Transit Corridor project would be an important component of the transportation system for Los Angeles, enhancing regional and local connectivity and accessibility. This technical memorandum considered the impacts to local and regional economies during construction and operation of each project alternative. Economic and fiscal impacts of each alternative were evaluated by analyzing the following:

- Property Tax Revenue Impacts
- Construction-Related Economic Impacts
- Construction Spending on the Regional Economy
- Construction-Related Employment
- Regional Economic Impacts

3.0 METHODOLOGY FOR IMPACT EVALUATION

3.1 NEPA Guidelines

The National Environmental Policy Act (NEPA) requires an examination of indirect consequences, or secondary impacts, which may occur in areas beyond the immediate influence of a proposed action and at some time in the future (40 CFR 1508.8). Consequences and impacts can include economic and fiscal changes due to a proposed project.

NEPA does not include specific guidelines on measuring adverse economic impacts, so this study measures impacts based on multipliers from the U.S. Department of Commerce. These multipliers were developed to estimate potential construction-related employment spending and economic impacts. The multipliers measure employment creation and total tax revenue generation.

3.2 CEQA Guidance

The draft EIS/EIR process must adhere to California Environmental Quality Act (CEQA) guidelines. CEQA guidelines state that economic changes resulting from a project shall not be treated as significant effects on the environment. Economic effects of a physical change, however, may be used to determine that the physical change is a significant change to the environment (CEQA 15358b). In the case of project alternatives, physical changes would result from construction; therefore, this section measures the effect construction would have on the existing economic environment.

In the absence of specific thresholds of significance for economic impacts, CEQA guidelines encourage each public agency to develop their own. The following thresholds of significance were applied in the analysis of economic and fiscal impacts of the Regional Connector Transit Corridor project alternatives.

- The alternative would substantially reduce the amount or value of taxable property in the study area.
- Construction of the alternative would have substantial, adverse effects on businesses along the alignment.

3.3 Methodology

3.2.1 Tax Revenue Impacts

Using alignment maps, conceptual station plans, and potential construction staging maps, specific parcels or portions of parcels have been identified for possible acquisition. Using these same resources and historical data from similar developments, this analysis identified a

benefits area that will capture potential increases in property value and tax revenue due to station location.

Assessor's Parcel Number, land value, improvement value, square footage, 2009 tax payments, and owner's information were obtained from the Los Angeles County Tax Assessor's office. 2009 property tax records were used to estimate tax revenue loss for identified parcels that would be completely acquired.

Trends in property value increases were identified using historical data. They were used to analyze potential property tax and property value increases that could result from new station sites.

3.2.2 Construction-Related Economic Impacts

For each build alternative, construction would last approximately 4 to 5 years. Surface streets would be impacted for approximately 24 to 36 months. The duration of the proposed construction and extent of impacts to surface streets could affect local businesses.

Construction-related impacts and areas that could be affected were identified using site maps, location of construction staging areas, and conceptual station designs. Windshield surveys were conducted to identify local businesses and categorize them by use. Vehicular and pedestrian access was identified for each business along the proposed alignments.

Historical data were gathered for similar transit projects completed in the downtown area. These data were used in a quantitative assessment of business viability to estimate the potential significance of construction impacts.

3.2.3 Construction Spending on the Regional Economy

Direct investment in construction leads to investment from businesses in the area. Local businesses seek to take advantage of the increase in spending (purchases of supplies and equipment) and employment activity. Such investment is considered indirect investment.

Both direct and indirect investment streams provide businesses in the regional economy revenue and personal income. Income spent throughout the economy supports other jobs and related spending. Such effects are referred to as induced impacts. A multiplier developed by the U.S. Department of Commerce was used to quantify the impacts of construction-related spending on the regional economy.

3.2.4 Construction-Related Employment

Investment in transportation, including direct investment in the form of capital construction and operations costs, provides economic benefits in two basic ways. It creates jobs and leads to investment or spending by suppliers whose goods and services are used in a project. This

analysis used the same multiplier to calculate impacts to employment as it used to calculate construction-related spending. The employment analysis was compared to SCAG employment projections for the same period.

3.2.5 Regional Economic Impacts

Improved accessibility and mobility could lead to an increase in employment opportunities for the regional population. Improved mobility could result in decreases in regional hours of travel and costs associated with regional travel. Information from travel demand models was used to characterize potential shifts in regional travel behavior and transit ridership as a result of improved connectivity.

4.0 AFFECTED ENVIRONMENT

4.1 Project Area

The project area for purposes of evaluating economic and fiscal impacts is generally the same as in the Growth-Inducing Impacts Technical Memorandum. The analysis of direct and indirect regional economic and fiscal impacts focuses on downtown Los Angeles and areas served by transit lines that would connect to the Regional Connector in Los Angeles County (Long Beach, Pasadena, Culver City, and East Los Angeles).

The project area lies within the geographic scope of the City of Los Angeles Council of Governments (CLACG), a subregion of SCAG, which includes Los Angeles, San Fernando and portions of unincorporated areas of Los Angeles County. The analysis of potential property tax and construction-related impacts focuses on properties directly abutting the proposed alignments.

4.2 Regional Population and Employment Projections

As discussed in the Growth-Inducing Impacts Technical Memorandum, the region could have a population of more than 24 million persons with 10.2 million persons employed by 2035. This would represent an increase of approximately 26 percent over 2008 conditions. Population and employment in Los Angeles County are projected to increase by 1.8 million people and 542,574 jobs between 2008 and 2035.

This would represent an average annual increase of approximately 69,953 persons and 20,095 jobs. Los Angeles County is expected to experience the slowest rate of job growth in a five-county region (Los Angeles, Orange, Riverside, San Bernardino, Ventura, and Imperial). The job growth rate in Los Angeles County is expected to increase 0.4 percent annually.

4.3 Local Population and Employment Projections

This section includes population, housing, and employment growth estimates for census tracts comprising the project area. For comparison purposes, this section includes data from the City of Los Angeles and the CLACG.

The City of Los Angeles is expected to increase by 274,285 households by the year 2035. The City would comprise approximately 21 percent of the region's total households. The project area is expected to increase by 2,552 households. This represents a minimal share of the City's total project household growth, but growth would occur at a similar rate (0.77 %) as in the City (0.76 %) and the CLACG subregion (0.75 %).

Table 4-1 shows employment growth for the project area, City of Los Angeles, and CLACG subregion. The table shows that the project area is expected to gain approximately 12,630

new jobs by 2035. This would be an increase in employment of approximately 0.26 percent per year between 2008 and 2035. The annual rate of growth for the project area would be similar to that in the City but lower than in the CLACG subregion.

Table 4-1. Local Area Employment Growth 2008-2035

Area	2008	2035	2000-2008 Employment Change	2008-2035 Annual Average % Change
CLACG	1,839,988	2,037,473	197,485	0.40
City of Los Angeles	1,879,666	1,994,137	114,471	0.23
Project Area	169,328	181,962	12,634	0.26

4.4 Local Businesses and Privately-Owned Properties

Properties adjacent to proposed alignments are comprised of high-density multi-family, commercial, industrial, and government-related uses. Construction activities under build alternatives could affect the mix of business and government-related uses along the alignment. Approximately 112 businesses and commercial office buildings along the proposed alignments could be impacted.

Acquisitions of privately-owned properties would affect city, county and state property tax generation in this area. Under the At-Grade Emphasis LRT Alternative, 56 privately-owned properties would directly abut the alignment. These businesses represent a total tax base of $21,867,759.

With the Underground Emphasis LRT Alternative, 82 privately-owned parcels would abut the alignment. This represents a property tax base of $24,280,248. With the Fully Underground LRT Alternatives – Little Tokyo Variations 1 and 2, 90 privately-owned properties would directly abut the alignment. These properties represent a property tax base of $24,365,168.

5.0 IMPACTS

5.1 Property Tax Revenue Impacts

Project alternatives would use the public right-of-way for track construction and station sites, minimizing the need for land acquisition. However, some acquisitions would be required under each build alternative. Property tax losses would result. Property tax losses from the acquisition of privately-owned properties would likely be offset by increases in property values.

Property tax losses would not occur from acquisitions of government-owned parcels. Property tax losses would result strictly from acquisitions of privately-owned parcels where owners pay an annual property tax. Thus, section 5.1 only analyzed partial and full takes of privately-owned parcels. Using Los Angeles County Tax Assessor 2009 data, property tax loss was calculated based on the amount of square feet to be acquired (the impact area). The No Build and TSM Alternatives would not involve property acquisitions and would not have property tax revenue impacts.

5.1.1 At-Grade Emphasis LRT Alternative

Five privately-owned parcels would be acquired with the At-Grade Emphasis LRT Alternative. The acquisitions would be partial takes. The impact area outlined in Table 5-1 shows the approximate size of property (square feet) that would be purchased. Acquisitions would be required for construction staging, new stations, a pedestrian overpass, and a Traction Power Substation (TPSS) site.

Total tax revenue loss due to land acquisitions with the At-Grade Emphasis LRT Alternative is estimated to be approximately $186,734 (see Table 5-1). This loss would be approximately 0.85 percent of the $21,867,759 property tax revenue base of all the properties that directly abut the alignment. The At-Grade Emphasis LRT Alternative would have a less than significant impact on property tax revenues for the area. Losses in property tax revenues could be offset by increases in property taxes in areas surrounding new stations.

5.1.2 Underground Emphasis LRT Alternative

The Underground Emphasis LRT Alternative would require the acquisition of more privately-owned parcels than the At-Grade Emphasis LRT Alternative. Acquisitions would be required for construction staging, new stations, portals, a bridge pier, and a pedestrian overpass. Both partial and full takes would be required. Twenty privately-owned parcels would be impacted under this alternative.

Nine of these parcels are located in the Little Tokyo area, on the block bounded by 1st, 2nd, Alameda Streets and Central Avenue. Total tax revenue loss from acquisitions is estimated to be approximately $286,847. Losses to property tax revenues would be approximately 1.2

percent of the area's $24,280,248 tax revenue base of all the properties that directly abut the alignment. Property tax revenue loss would be a less than significant impact. Losses in property tax revenues could be offset by increases in property taxes in areas surrounding new stations.

5.1.3 Fully Underground LRT Alternative – Little Tokyo Variation 1

The Fully Underground LRT Alternative – Little Tokyo Variation 1 would require acquisitions of 17 properties. Fewer parcels would be acquired under this alternative than the Underground Emphasis LRT Alternative. However, acquisitions of parcels bounded by 1st, 2nd, and Alameda Streets and Central Avenue would be full takes and not partial takes like in the Underground Emphasis LRT Alternative. Metro intends to maintain some of the existing businesses acquired on Central Avenue between 1st and 2nd Streets that would not be directly impacted by construction activities.

Property tax losses for the Fully Underground LRT Alternative – Variation 1 would be approximately $281,775. This is slightly less than the Underground Emphasis LRT Alternative. Property tax revenue losses would represent 1.2 percent of the area's $24,365,168 tax revenue base of all the properties that directly abut the alignment. Property tax revenue loss would be a less than a significant impact. Losses in property tax revenues could be offset by increases in property taxes in areas surrounding new stations.

5.1.4 Fully Underground LRT Alternative – Little Tokyo Variation 2

The Fully Underground LRT Alternative – Little Tokyo Variation 2 would require acquisitions of generally the same properties as the Fully Underground LRT Alternative – Little Tokyo Variation 1. This alternative would require only a partial take of parcel #5161018020 but would require acquisitions of two additional parcels. The two additional properties are located on 1st Street between Hewitt and Garey Streets. The properties would be required for street relocation purposes.

The total property tax loss for the Fully Underground LRT Alternative – Little Tokyo Variation 2 would be $278,556 or 1.1 percent of the area's $24,365,168 property tax base of all the properties that directly abut the alignment. This would be less than significant impact to property tax revenues. Losses in property tax revenue could be offset by increases in property taxes in areas surrounding new stations.

5.1.5 Property Value Impacts

Loss in property tax revenue from land acquisitions would likely be offset by increases in overall property values as a result of new transit station sites. According to the 2001 study *The Effect of Rail Transit on Property Values* (Parsons-Brinckerhoff), the impact to commercial property values from new transit rail stations varies according to:

- How much the stations improve accessibility
- The relative attractiveness of locations near stations
- The real estate market in the region

The four build alternatives would increase connectivity between light rail lines. Accessibility and mobility by train in lieu of car would be improved regionally and especially for businesses and residential properties near new station sites. Based on current ridership models, the build alternatives could increase ridership by 12,300 to 17,500 new passengers.

Increased accessibility around station sites would significantly enhance the area for businesses and residents. The following are examples of benefits to property values from similar LRT projects:

- In the San Francisco Bay Area, in Alameda and Contra Costa counties, residential property values decline by $3,200 to $3,700 per square foot per mile as ones moves away from Bay Area Rapid Transit (BART) stations. Commercial property values also decrease as one moves further from stations (Transportation Research Board 1993).
- In Dallas, commercial property values near Dallas Area Rapid Transit (DART) rail stations increased 53 percent more than comparable commercial properties not near station sites (Center for Economic Development and Research University of Northern Texas September 2002).
- In Washington, DC and Atlanta, average office rents near station sites rose with system-wide ridership. Additionally, office vacancy rates were lower around station sites (Klosterman 1994).

5.2 Construction-Related Economic Impacts

Construction-related impacts to businesses could occur in areas adjacent to the proposed alignment. Impacts would likely be most significant near proposed station sites due to sidewalk closures. Businesses with at-grade, retail store fronts catering to pedestrians would be most directly impacted by construction.

A temporary decrease in business accessibility due to construction could lessen the competitiveness and attractiveness of businesses near construction sites. The No Build and TSM Alternatives would not involve construction that would impact businesses. However, the TSM alternative would require permanent removal of approximately 24 curb parking spaces from 2nd Street, Hill Street and Central Avenue.

Potential construction impacts of the build alternatives are as follows:

- Traffic disruption
- Increased noise, vibration, and dust
- Modified vehicular and pedestrian traffic patterns
- Modified parking areas
- Utility disruptions
- Reduction in business access/visibility of signs and businesses
- General disinterest in area businesses due to construction

The project would be fully implemented by 2018. Depending on the phasing schedule, businesses would be affected by construction at different intervals throughout the four to five year construction period. Figure 5-1 divides the project area into four distinct geographic areas for purposes of analyzing potential impacts.

Flower Street: Flower Street, between 3rd Street and Wilshire Boulevard, runs through the heart of downtown. The street is lined with hotels, street level retail space, and medium to high-density multi-family residential units.

2nd Street: Land uses along 2nd Street, between Los Angeles and Flower Streets, are largely commercial (retail and office buildings) and minimally high-density residential. Second Street, between Broadway and Figueroa Street, runs through a tunnel beneath Bunker Hill. The segment of 2nd Street through the tunnel consists of two lanes in each direction.

Little Tokyo: 2nd Street, between Los Angeles and Alameda Streets, runs through the heart of Little Tokyo. The street is lined with restaurants, hotels, Japanese markets, and retail stores. The area contains many recently-completed residential and mixed-use projects.

Civic Center: Government offices and employment are concentrated within the Civic Center area. Here, the Civic Center is defined as Temple Street between Main and Alameda Streets and Los Angeles and Main Streets between Temple and 2nd Streets. City Hall, City Hall East, the Caltrans Building, VA Hospital, Los Angeles Police Department Headquarters, Federal Building, and Courthouse are found in this area.

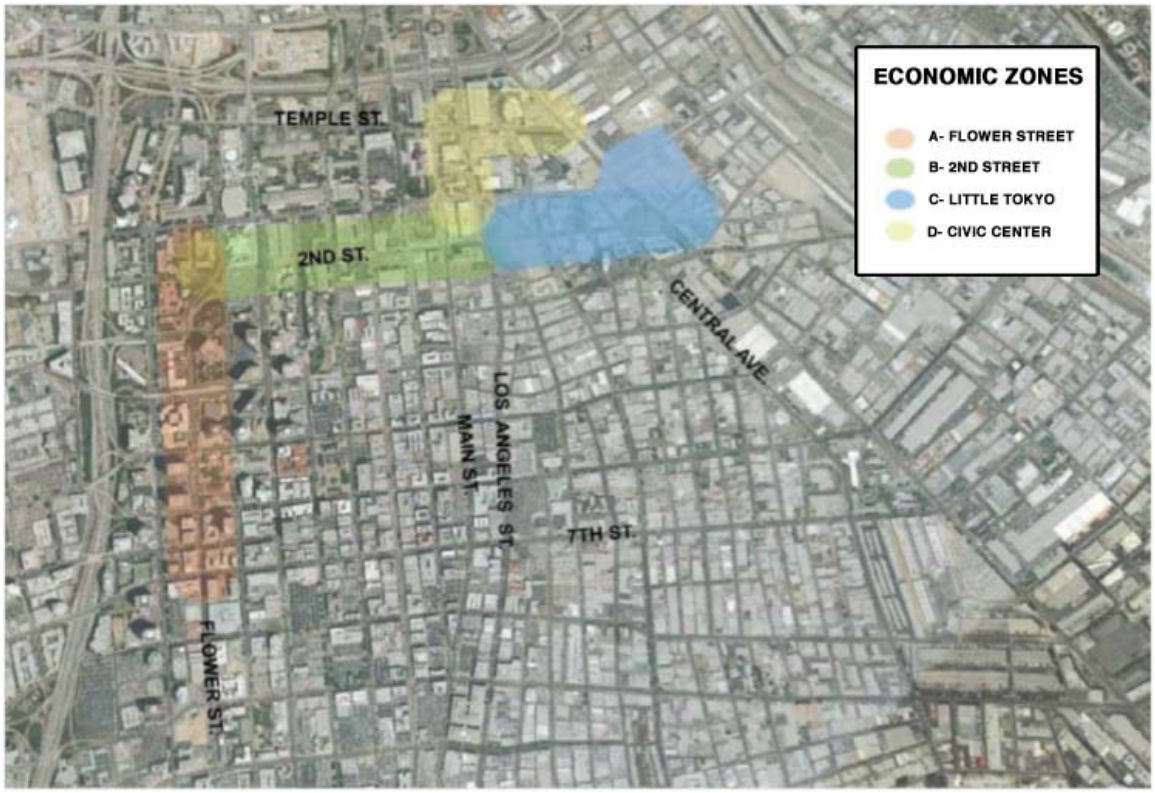

Figure 5-1. Economic Zone Map

5.2.1 Transportation System Management Alternative

The TSM Alternative would not require construction activities or have construction-related impacts to businesses. However, the TSM Alternative would require the permanent removal of approximately 24 curb parking spaces on 2nd Street between Hill Street and Central Avenue. Parking spots would be removed to accommodate six new bus stops. This analysis assumed that each new bus stop on 2nd Street would be 90 feet in length and displace up to four curb parking spaces.

Approximately 18 businesses between Hill Street and Central Avenue could be impacted by the loss of parking spaces. The exact locations of new bus stops has not been determined, so it is difficult to estimate the level of impacts parking displacements could have on businesses.

5.2.2 At-Grade Emphasis LRT Alternative

5.2.2.1 Flower Street

The At-Grade Emphasis LRT Alternative would have both at-grade and underground double track configurations. It would connect the 7th Street/Metro Center Station to the Metro Gold Line.

Under this alternative, tracks would run underground beneath Flower Street from the 7th Street/Metro Center Station to the 2nd Street tunnel. The alignment would briefly surface before 3rd Street and return underground after 3rd Street. This alternative would create two underground stations. One station would be between Hope and Flower Streets and one would be beneath Flower Street between 5th and 6th Streets.

During construction, street closures would be implemented in phases. Impacts to traffic disruptions would depend on tunneling techniques used and locations of exhaust vents. Construction effects that would disrupt business activities would be limited to areas of cut and cover construction. Such effects include noise, vibration, dust, decreased view of signage and overall disinterest in the area. Cut and cover construction would cause sidewalk and street closures near new station locations and have the greatest impacts to businesses located within close proximity.

Approximately 80 parking spaces would be permanently displaced for construction of the alternative. Such displacement of parking could have significant, adverse impacts to businesses. Of the 80 parking spaces, 12 are located on Flower Street between 3rd and 5th Streets. Seven of those 12 spaces are located on the east side of Flower Street, and five of them are located on the west side. Table 5-5 shows a detailed breakdown of the businesses that would be affected on Flower Street.

Table 5-5. Businesses On Flower Street Potentially Affected During At-Grade Emphasis LRT Alternative Construction	
Business	**Construction-Related Impacts**
World Trade Center Parking	The World Trade Center parking lot located near the corner of 3rd and Flower Streets would have decreased access due to construction and possible street closure. The parking lot has alternate access on Figueroa Street that could alleviate some adverse impact.
World Trade Center Monthly Parking Entrance	The World Trade Center monthly parking lot located near the corner of 3rd and Flower Streets would experience decreased access due to construction and possible street closure. The parking lot has alternate access on Figueroa Street that could alleviate some adverse impact.
Bank of America Plaza Parking	The Bank of America Plaza parking lot located near the corner of 3rd and Flower Streets would experience decreased access due to construction and possible street closure. The parking lot has alternate access from Bunker Hill that could alleviate some adverse impact.
400 S. Flower Parking	The parking lot located at 400 S. Flower Street at the corner of 4th and Flower Streets would experience decreased access due to construction and possible temporary, intermittent street closure.
City National Plaza Parking	The City National Plaza parking lot located near the corner of 4th and Flower Streets would experience decreased access due to construction and possible temporary, intermittent street closure.
Westin Bonaventure	The entrance to the Westin Bonaventure is located on Flower Street in between 5th and 4th Streets. Construction would decrease access to the hotel from Flower Street and could decrease overall appeal of the hotel entrance from Flower Street. The Hotel has an entrance from Figueroa Street that could alleviate the significance of this impact.
Suede	The entrance to Suede Restaurant is located on Flower Street near the corner of 4th and Flower Streets. Construction would decrease access to the restaurant from Flower Street and could decrease overall appeal of the restaurant. The restaurant has access from the Westin Bonaventure Hotel that could alleviate the severity of this impact.

Table 5-5. Businesses On Flower Street Potentially Affected During At-Grade Emphasis LRT Alternative Construction	
Business	**Construction-Related Impacts**
Citibank	The entrance to Citi Bank is located at the corner of Flower and 5th Streets. Citi Bank could be affected by a decrease in accessibility by the loss of seven curb parking spaces Flower Street.
Westin Parking Entrance	The Westin Hotel parking lot at the corner of 5th and Flower Streets would experience decreased access due to construction and possible temporary and intermittent street closure. The parking lot has alternate access on Figueroa Street that could alleviate some of the impact.
Standard Hotel Parking Entrance	The Standard Hotel parking lot near the corner of 6th and Flower Streets would suffer decreased access due to construction and possible temporary and intermittent street closure.
Standard Hotel Entrance	The Standard Hotel Entrance on Flower Street would be affected by construction impacts; however, the main entrance to the hotel is on 6th Street.
Floyd's Barbershop	Floyd's Barbershop, located on the ground floor of the Standard Hotel, has an entrance on Flower Street that would be affected. However, the barbershop can also be accessed from the hotel.
Pegasus	The Pegasus Apartments would be affected by street closures and construction in the area. Traffic disruptions would impact tenant mobility and could influence leasing activities.
Daily Grill	The entrance to the Daily Grill is located at the corner of Flower and 7th Streets. Street closure in this area would make accessing the restaurant difficult from Flower Street; however, patrons would be able to access the restaurant from 7th Street
Roosevelt Lofts	Access to the Roosevelt Lofts would be decreased due to street closure on Flower Street, but the development could be accessed from Hope Street. Depending on the tunnel construction technique used for the underground segment of the track in this area, tenants of the Roosevelt could be impacted by increased noise, vibration, and dust. This could impact vacancy rates in the high-density, residential development.

Table 5-5. Businesses On Flower Street Potentially Affected During At-Grade Emphasis LRT Alternative Construction	
Business	**Construction-Related Impacts**
City National Plaza Valet Entrance	Access to the City National Plaza valet entrance would be limited during construction due to possible street closure.
City National Plaza	A new underground station would be located at the City National Bank branch on the ground floor of the City National Plaza building.
800 W. 6th Parking	Access to the 800 W. 6th Street parking lot would be limited during construction due to possible street closure.
Cathay Bank	Access to the Bank would be limited during construction due to possible street closure.
Vieta Café	Access to the cafe would be limited during construction due to possible street closure.
Maria's Italian Kitchen	Access to the restaurant would be limited during construction due to possible street closure.
ABC Printing	Access to ABC printing would be limited during construction due to possible street closure.
Mail Box Etc.	Access to Mail Box Etc. would be limited during construction due to possible street closure.
PCS Printing	Access to PCS Select would be limited during construction due to possible street closure.
Big Mamma's Pizza	Access to Big Mamma's Pizza would be limited during construction due to possible street closure.

5.2.2.2 2nd Street

This segment of the alignment would run above ground with the At-Grade Emphasis LRT Alternative. This alternative would include new stations on 2nd Street. A portion of 2nd Street runs through a tunnel underneath Bunker Hill. The tunnel would likely be shut down during track construction. This would cause traffic disturbances on 2nd Street and throughout the area. However, constructing tracks here avoids impacts to businesses because none are located in the tunnel.

Construction of at-grade segments of the alignment would directly impact businesses on 2nd Street between Los Angeles and Hill Streets. Approximately 23 parking spaces on the south side of 2nd Street, between Hill and Los Angeles Streets, would be removed for construction. The new Los Angeles Police Department Headquarters and the Los Angeles Times office buildings are located along 2nd Street.

Construction impacts would be relatively significant in this area because retail businesses along 2nd Street, including Pitfire Pizza, China Bistro, and the Kawada Hotel, have greater dependence on pedestrian traffic for customers than other businesses along the alignment. Table 5-6 shows businesses along 2nd Street that could be affected by at-grade track and station construction.

5.2.2.3 Little Tokyo

The At-Grade Emphasis LRT Alternative does not run through Little Tokyo as it turns north from 2nd Street to Los Angeles Street. However, 2nd Street is the general access point for most businesses in Little Tokyo. Any decreased mobility on 2nd Street could cause adverse impacts in Little Tokyo. Businesses along 2nd Street, between Los Angeles Street and Central Avenue, could be significantly affected during track construction on the corner of 2nd Street and Los Angeles Street due to a decrease in accessibility.

5.2.2.4 Civic Center

In this segment, the At-Grade Emphasis LRT Alternative would run above ground. Dual track configurations would run in the majority of this section, with a single-track configuration on both Main and Los Angeles Streets between 2nd and Temple Streets. This alternative proposes a couplet station in the Civic Center area: a southbound platform on Los Angeles Street between Temple and 1st Streets, and a northbound platform on Main Street.

For the most part the alignment runs within the public right-of-way, limiting the need for land acquisition and pedestrian walkway closures during construction. Depending on the design, technology, and construction techniques employed, phased street closures would be required to complete track construction. Traffic disruption would decrease access to businesses in the area.

Government entities located within the Civic Center do not depend on pedestrian or automobile traffic to generate revenue. Therefore, economic impacts to this area would be relatively less significant than in other areas along the alignment. Traffic disruptions could decrease access to government offices for government employees and citizens seeking services.

The At-Grade Emphasis LRT Alternative would construct a pedestrian overpass and an automobile underpass at the intersection of Alameda and Temple Streets. However,

construction activities would not likely significantly impact businesses because the intersection is mostly surrounded by parking lots or buildings that do not have entrances near the intersection.

Table 5-6. Businesses on 2nd Street Potentially Affected During At-Grade Emphasis LRT Alternative Construction

Business	Construction-Related Impacts
Pitfire Pizza	The main entrance to the restaurant is located at the corner of 2nd and Main Streets and could be significantly impacted. Construction could cause increased noise, vibration, dust, decreased view of signage, and a general disinterest in the area. Loss of parking spaces along 2nd Street could cause significant impacts by reducing accessibility to the business.
China Bistro	China Bistro is located at 2nd and Main Streets. Track construction could cause increased noise, vibration, particulate matter, decreased view of signage, and a general disinterest in the area. Loss of metered parking spaces directly in front of China Bistro could significantly impact its business by reducing accessibility.
Edison Bar	The Edison bar is located at 2nd and Main Streets. The main entrance to the bar is located in an alley between Spring and Main Streets, alleviating some potential access issues on 2nd Street. Impacts could include increased noise, vibration, dust, decreased view of signage, and a general disinterest in the area.
Groundwork Coffee	Groundwork Coffee is located near the corner of 2nd and Main Streets. Impacts could include increased noise, vibration, dust, decreased view of signage, and a general disinterest in the area.
2nd Street Cigar & Gallery	2nd Street Cigar & Gallery is located near the corner of 2nd and Spring Streets. Pedestrian access to the business from 2nd Street would be removed for the duration of track construction for this phase of the project. Impacts could include increased noise, vibration, dust, decreased view of signage, and a general disinterest in the area. Loss of metered parking spaces directly in front of China Bistro could significantly impact its business by reducing accessibility.
Kawada Hotel	The Kawada Hotel is located at 2nd Street and Broadway Impacts could include decreased access and overall attractiveness and increased noise, vibration, and dust. Increased vacancy rates would be likely.

Approximately 21 curb parking spaces would be removed in the Civic Center area for construction of the At-Grade Emphasis LRT Alternative. Eleven of those spaces are located on the east side of Main Street between 2nd and Temple Streets. The other 10 spaces are located on the east side of Los Angeles Street between 2nd and Temple Streets. Parking spaces along both these streets are mostly used by government employees, and losing these spaces would not have a significant impact to surrounding businesses.

Construction of at-grade stations would require pedestrian walkway closures that could cause significant temporary impacts near proposed station sites. Businesses in the area are predominately government-oriented and tend not to rely on traffic to generate customers. Table 5-7 shows a detailed breakdown of businesses in the area that could be temporarily affected by construction of the couplet station. Construction is estimated to last between 24-36 months in this area.

5.2.3 Underground Emphasis LRT Alternative

Construction of the Underground Emphasis LRT Alternative could have significant construction impacts to businesses near station sites. Depending on tunneling and construction techniques used to construct the tunnel, phrased street closures may be required. However, impacts would not be as significant as under the At-Grade Emphasis LRT Alternative. Boring of the tunnel could increase noise and vibration, but it would not be severe enough to economically impact business or inhabitants in the area.

Economic impacts caused by the Underground Emphasis LRT Alternative would mostly be limited to businesses surrounding station sites and cut-and-cover construction areas. However, these impacts could expand geographically due to a general decrease in the desirability of the area during construction. For this section of the report, it is assumed that a cut-and-cover technique would be used to construct new stations.

Cut-and-cover construction would generate temporary inconveniences like increased noise, vibration, and dust, decreased view of signage, limited or no access to business within close proximity of new station areas, and a general disinterest in the area. There are two station options proposed on 2nd Street, the 2nd Street station - Broadway Option and the 2nd Street station - Los Angeles Street Option.

Like the At-Grade Emphasis LRT Alternative, the Underground Emphasis LRT Alternative calls for construction of a pedestrian overpass and an automobile underpass. However, under this alternative, it would be constructed at the intersection of 1st and Alameda Streets. Construction of the overpass and underpass would necessitate additional pedestrian and roadway detours. This could cause significant impacts to businesses in the Little Tokyo area.

Approximately 20 curb parking spaces would be removed for construction of the Underground Emphasis LRT Alternative. Seven of those spaces are on the east side of Flower Street between 3rd and 5th Streets. The other 13 are on Alameda Street between Aliso and 2nd Streets. The loss in curb parking spaces could have significant impacts to businesses like Citibank on Flower Street, which currently depends on those spaces for some daytime customer parking needs.

Table 5-7. Businesses in the Civic Center Potentially Affected During At-Grade Emphasis LRT Alternative Construction

Business	Construction-Related Impacts
Geffen Contemporary	The main parking area for the museum is on Temple Street. Construction would very likely cause a decreased use of the parking lot and a loss in parking revenue. It would lead to parking difficulties for Geffen Contemporary patrons, which could reduce patronage. The main entrance for the museum is on 1st Street, which reduces the noise, dust and vibration effects of construction.
Los Angeles Mall Entrance	The Los Angeles Mall is bounded by Main, Temple and Los Angeles Streets and would be impacted by construction of the LRT track. The entrance on Los Angeles Street is in close proximity to the proposed northbound couplet station. Pedestrian and vehicular access to the mall would decrease, which could have adverse impacts to businesses located inside the mall.
Kyoto Grand Hotel	The Kyoto Grand Hotel is located on Los Angeles Street between 1st and 2nd Streets. The main entrance to the hotel lobby and parking structure is on Los Angeles Street, so construction effects could be relatively significant. Impacts could include decreased access to the hotel, increased noise and vibration, decreased visibility of signs, and a general disinterest in the area.
Starbucks	Starbucks Coffee is on the corner of 1st and Los Angeles Streets. It would be affected track and couplet station platform construction on Los Angeles Street. Starbucks would suffer the same impacts as the Kyoto Grand Hotel; however, Starbucks could be accessed from 1st Street, alleviating some impacts.
Azalea Restaurant	Azalea Restaurant is near the corner of 1st and Los Angeles Streets. It would be significantly impacted by construction of track and the couplet station platform on Los Angeles Street. Like Starbucks and the Kyoto Grand hotel, the restaurant would be significantly impacted by

Table 5-7. Businesses in the Civic Center Potentially Affected During At-Grade Emphasis LRT Alternative Construction	
Business	**Construction-Related Impacts**
	construction activities.

If street closure is necessary to construct the tunnel and 2nd Street station - Broadway Option, the businesses mentioned in the previous section, except those located within the Civic Center area, would be negatively affected by decreased access. Table 5-8 shows a detailed breakdown of businesses in close proximity to proposed station sites.

Table 5-8. Businesses within Close Proximity to Station Sites Proposed for the Underground Emphasis LRT Alternative	
Business	**Construction-Related Impacts**
Flower Street	
Westin Bonaventure	The entrance to the Westin Bonaventure is on Flower Street at the corner of 4th and Flower Streets. Station construction would decrease access to the hotel from Flower Street, and construction impacts could decrease overall appeal of the hotel entrance from Flower Street. The hotel has an entrance from Figueroa Street that could alleviate the severity of this impact.
Suede	The entrance to Suede restaurant is on Flower Street near the corner of 4th and Flower Streets. Station construction would decrease access to the restaurant from Flower Street, and construction impacts could decrease overall appeal of the restaurant. The restaurant has access from the Westin Bonaventure Hotel that could alleviate the severity of this impact.
Citi Parking Entrance	The entrance to the Citi parking lot located near the corner of 5th and Flower Streets would have decreased access due to construction and could be impacted by temporary, intermittent street closures.
Starbucks	Starbucks, located on the ground floor of the Citi Bank Center, would be affected by construction of both tracks on Flower Street and the proposed underground station between 4th and 5th Streets. Starbucks is within the station construction area and would be affected by noise, vibration, and dust.

Table 5-8. Businesses within Close Proximity to Station Sites Proposed for the Underground Emphasis LRT Alternative

Business	Construction-Related Impacts
Citibank	Citibank, located on the ground floor of the Citi Bank Center, would be affected by construction of both tracks on Flower Street and the proposed underground station between 4th and 5th Streets. Citibank is located in the station construction area and would be affected by noise, vibration, and dust. Citibank could be affected by the loss of seven curb parking spaces directly in front of its entrance on Flower Street.
Uptown Drug Store	The proposed underground station between 4th and 5th Streets would affect Uptown Drug Store on the ground floor of the Citi Bank Center. Uptown Drug Store is located in the station construction area and would be affected by the noise, vibration, and dust.
California Computer Center	The California Computer Center, located on the ground floor of the Citi Bank Center, would be affected by construction of both tracks on Flower Street and the proposed underground station between 4th and 5th Streets. Although the Computer Center is not located in the station construction area, it is close to it, and might be affected by noise, vibration, and dust.
2nd Street	
Grand Kyoto Hotel	The Grand Kyoto Hotel would be affected by construction of the 2nd Street station - Los Angeles Street Option. Although the hotel is not directly in the station construction area, the main entrance to the hotel lobby and parking structure are located on Los Angeles Street. Noise, dust, and vibration from construction could impact the hotel's business.
Starbucks	Starbucks would be affected by construction of the 2nd Street station - Los Angeles Street Option. Although Starbucks is not directly in the station construction area, the entrance is located on Los Angeles Street, and noise, dust, and vibration from construction would impact business.
Azalea Restaurant	The Azalea Restaurant would be affected by construction of the 2nd Street station - Los Angeles Street Option. Although the restaurant is not directly in the station construction area, the entrance is located on Los Angeles Street, and noise, dust, and vibration from construction would impact business.
Little Tokyo	

Table 5-8. Businesses within Close Proximity to Station Sites Proposed for the Underground Emphasis LRT Alternative

Business	Construction-Related Impacts
American Apparel	American Apparel is located on 2nd Street between Azusa Street and Central Avenue. Cut and cover construction is proposed on 2nd Street and would begin directly in front of American Apparel. This could cause significant impacts during construction. American Apparel and other businesses nearby depend mostly on foot traffic. Any heavy construction in this area would likely decrease accessibility and make the area less desirable for consumers to visit. The temporary removal of curb parking spaces in front of American Apparel along 2nd Street would also likely lead to significant impacts. Cut and cover construction would likely last between 24-48 months and involve temporary, intermittent street closures.
EBISU	This retail store is located directly across from the American Apparel store and would be similarly impacted.
KIMSKImakes	This retail store is adjacent to American Apparel and would be similarly impacted.
SPITZ Doner Kebab	This restaurant is on 2nd Street near businesses mentioned above and would be similarly impacted.
2nd Street Jazz Bar & Grill	The 2nd Street Jazz Bar & Grill is located on 2nd near Central Avenue near other businesses mentioned above. It would likely be similarly impacted.
Subway	Subway is located adjacent to 2nd Street Jazz Bar & Grill and would likely be similarly impacted.
City Hair	City Hair is located next to Subway near the corner of 2nd Street and Central Avenue and would be similarly impacted.
FedEx Kinko's	FedEx Kinko's is located across from City Hair on the northwest corner of 2nd Street and Central Avenue and would be similarly impacted. However, FedEx Kinko's is accessible from both 2nd Street and Central Avenue, and impacts may not be as significant as those to previously mentioned businesses.
Honda Plaza	Honda Plaza is a strip mall bounded by 2nd Street, Central Avenue, and Alameda Street. Nineteen businesses in this plaza could be impacted by cut and cover construction proposed on 2nd Street. Access to the parking entrance on 2nd Street would be decreased during construction, and construction noise and dust would decrease the general desirability of the area. Therefore, construction could result insignificant impacts. Honda Plaza has another parking entrance on Alameda Street that would not be

Table 5-8. Businesses within Close Proximity to Station Sites Proposed for the Underground Emphasis LRT Alternative	
Business	**Construction-Related Impacts**
	impacted during construction. This entrance would alleviate some of the accessibility issues along 2nd Street.

5.2.4 Fully Underground LRT Alternative – Little Tokyo Variation 1

West of Central Avenue, the Fully Underground LRT Alternative – Little Tokyo Variation 1 would follow generally the same alignment as the Underground Emphasis LRT Alternative and would have similar construction-related impacts to local businesses. However, this alternative does not propose a pedestrian overpass or automobile underpass at the intersection of 1st and Alameda Streets. This would result in less significant impacts to nearby businesses than the Underground Emphasis LRT Alternative.

This alternative would remove the same seven curb parking spaces as the Underground Emphasis LRT Alternative on Flower Street between 5th and 3rd Streets but not the 13 spaces on Alameda Street between Aliso and 2nd Streets. This alternative would include extensive street relocation and roadway work east of Alameda Street along 1st Street. Most roadway work on 1st Street for the Fully Underground LRT Alternative – Little Tokyo Variation 1 would occur between Alameda and Vignes Streets. Table 5-9 shows businesses on the south side of 1st Street that could be impacted by construction.

Table 5-9. Businesses within Close Proximity to Station Sites Proposed for the Fully Underground LRT Alternatives	
Business	**Construction-Related Impacts**
Kato's Sewing Machines	Kato's Sewing Machine is a retail store near the corner of 1st and Rose Street that could be significantly impacted by construction activities. The only entrance for customers is on 1st street, and any major construction activity would likely deter customers from visiting the store.
P.G. Motoring	P.G. Motoring is a retail store located just east of Kato's Sewing Machine and could also be significantly impacted by construction on 1st Street. The only entrance for visitors is on 1st Street. This entrance would be significantly impacted during temporary street closures as construction progresses.
District Healing	The District Healing Center's only parking entrance is on 1st Street. It could be significantly impacted during temporary, intermittent street closures during

Center	construction. Visitors to the District Healing Center would have to park on Hewitt Street and enter the building from the secondary entrance on that street.
Hiroshima Building	The Hiroshima Building is a two-story office building that would be significantly impacted by construction on 1st street. The hotel's only parking entrance fronts 1st Street. However, the Hiroshima Building is attached to parking behind the building that is accessible from 2nd and Garey Streets. This lot could be used as an alternative parking space during construction.
724 1st Street	The parking entrance to the office building on the corner of 1st and Garey Streets would not be significantly impacted during construction because it is located on the corner of 2nd and Garey Streets. However, access to the entrance to the building on 1st Street would be significantly limited during construction.

5.2.5 Fully Underground LRT Alternative – Little Tokyo Variation 2

The Fully Underground LRT Alternative – Little Tokyo Variation 2 follows generally the same alignment as Fully Underground LRT Alternative – Little Tokyo Variation 1 and would have similar construction-related impacts to local businesses.

5.3 Construction Spending on the Regional Economy

Investment in transportation, including direct investment in the form of capital construction and operations costs, provides economic benefits like direct and indirect job creation and investment or spending by suppliers whose goods and services are used in a project. To quantify the economic effects of construction spending, this analysis used 2008 multipliers from the Regional Input-Output Modeling System developed by the Bureau of Economic Analysis at the U.S. Department of Commerce. Los Angeles County Economic Development Corporation recently used this model for an Economic Impact Study report on the Metro Gold Line Foothill Extension Phase 2A.

Construction cost estimates for each build alternative, from which land acquisition and fees were excluded, were used to estimate total economic output, total employment, total earnings and total tax revenue. Direct investment in the form of capital construction cost can lead to investment from area business. Such businesses look to take advantage of the increase in employment activity and purchase of supplies and equipment. Such investment is considered indirect investment.

Both direct and indirect investment streams provide businesses revenue and personal income, and income spent throughout the economy supports other jobs and related spending. These secondary effects are referred to as induced impacts. Table 5-10 show the effects of the build alternatives on these forms of indirect investment.

Total output represents cumulative impacts associated with revenues of businesses involved in direct sales of the build alternatives or indirect sales from those businesses selling goods and services to workers who are directly involved in construction or operation activities of build alternatives. Total earnings include earnings from all direct and indirect workers associated with each build alternative. Total tax revenue includes income and sales taxes and local fees that would be generated as a result of increased job creation and spending from the build alternatives.

The At-Grade Emphasis LRT Alternative is estimated to generate the least amount of sales of the build alternatives. Its lower capital costs reflect the relatively low amount of materials and labor it would require.

The Fully Underground LRT Alternative – Little Tokyo Variation 2 would have the most beneficial economic impact of the build alternatives. At a cost of $1.54 billion, this alternative could generate increases in tax revenues of approximately $143 million and increase earnings by approximately $1.13 billion.

Table 5-10. Regional Economic Effects of the Regional Connector

Alternative	Initial Spending	Total Output	Total Earnings	Total Tax Revenue
At-Grade	$885 million	$1.9 billion	$619 million	$78 million
Underground	$1.2 billion	$2.8 billion	$927 million	$117 million
Fully Underground (Variation 1)	$1.4 billion	$3.2 billion	$1.05 billion	$132 million
Fully Underground (Variation 2)	$1.5 billion	$3.4 billion	$1.13 billion	$143 million

5.4 Construction-Related Employment Impacts

This analysis calculated direct and indirect impacts to employment from construction of the Regional Connector. The calculations used the same multipliers as in section 5.3. Employment impacts would be felt by industries throughout the five-county region in Southern California. Direct employment includes people who work on construction and operation of the Regional Connector. Indirect jobs are those that result from construction-related purchases and spending.

Industries that would be impacted through indirect jobs include professional and scientific services, retail trade, accommodation, food services, and manufacturing. Most direct jobs would occur during construction, while indirect jobs would occur over the entire life of the project. Table 5-11 show the results for each build alternative.

The At-Grade Emphasis LRT Alternative would likely create the fewest jobs of the build alternatives with 13,800. The other three build alternatives could create between 20,800 and 25,400 jobs in the region. Such job creation would not be considered adverse or significant. It would be within SCAG's estimates for job growth in the next decade.

Table 5-11. Construction Related Employment Impacts

Alternative	Direct Employment	Indirect Employment	Total
At-Grade	4,600	9,200	13,800
Underground	6,900	13,900	20,800
Fully Underground (Variation 1)	7,800	15,700	23,500
Fully Underground (Variation 2)	8,500	16,900	25,400

5.5 Regional Economic Impacts

Improved transit accessibility and mobility from downtown and other parts of the region would likely lead to an increase in employment and business opportunities for the regional population. Under each build alternative, transit market share increases (among all modes). Increases would be greatest under the Fully Underground LRT Alternatives – Little Tokyo Variations 1 and 2.

Increases would range from 12,286 additional linked trips under the At-Grade Emphasis LRT Alternative to 17,479 under the Fully Underground LRT Alternatives – Little Tokyo Variations 1 and 2. Compared to the TSM Alternative, the At-Grade Emphasis LRT Alternative would add an additional 6,999 linked trips. Compared to the TSM Alternative, the Fully Underground LRT Alternatives – Little Tokyo Variations 1 and 2 would add an additional 12,210 linked trips. Regionally, more people would use light-rail transit if the Regional Connector Transit corridor were developed. Greater transit usage would enhance accessibility and attractiveness of businesses surrounding stations sites.

Under each proposed build alternative, urban rail transit market shares would increase compared to the No-Build and TSM Alternatives. The greatest increases would occur under the Fully Underground LRT Alternatives – Little Tokyo Variations 1 and 2. The Fully

Underground Alternatives – Little Tokyo Variations 1 and 2 would increase urban rail transit market share by 6.52 percent compared to the TSM Alternative. An increase in regional transit riders would increase efficiency in travel times and create region-wide, economic benefits for businesses and employees traveling to and from work.

Under each proposed build alternative, urban rail passenger transfers would decrease compared to the No-Build and TSM alternatives. Table 5-12 shows that urban rail transit boardings per linked trip would be reduced under the build alternatives compared to the No Build and TSM alternatives. Reducing urban rail transit transfers would decrease travel time and costs for employees and businesses. It would increase the overall attractiveness of using public transit.

Table 5-13 shows that urban rail passenger miles traveled would increase under each proposed build alternative compared to the No Build and TSM Alternatives. Longer trips would suggest that the average commute of transit riders using LRT lines would increase in distance. This would provide a larger, regional labor pool for employers and increase employment opportunities for workers.

Table 5-12. Urban Rail Boardings per Linked Trip

Alternative	Peak	Off-Peak	Daily
No Build	1.34	1.22	1.30
TSM	1.33	1.22	1.30
At-Grade Emphasis	1.27	1.17	1.24
Underground Emphasis	1.27	1.17	1.24
Fully Underground (Variation 1)	1.27	1.17	1.24
Fully Underground (Variation 2)	1.27	1.17	1.24

Under each proposed build alternative, urban rail passenger boardings for Green Lines and North-South and East-West Lines (currently called the Gold, Blue, and Expo Lines) would increase compared to the No Build and TSM Alternatives. The proposed project would promote urban rail ridership outside of the project area at the regional level.

In general, urban rail provides residents, commuting employees, and visitors a safer, faster, and more reliable transportation alternative to automobiles. Urban rail travel is less expensive and often more convenient for commuters than automobile travel, such as in downtown Los

Angeles where parking is constrained. The four build alternatives would increase accessibility and mobility from downtown and other parts of the region by train in lieu of car. Regional residents and businesses could access the downtown Los Angeles area, and other employment activity centers, more efficiently.

Table 5-13. Urban Rail Passenger Miles Traveled per Linked Trips

Alternative	Peak	Off-Peak	Daily
No Build	8.59	7.11	8.11
TSM	8.56	7.12	8.10
At-Grade Emphasis	8.88	7.62	8.47
Underground Emphasis	8.96	7.70	8.56
Fully Underground (Variation 1)	9.05	7.80	8.65
Fully Underground (Variation 2)	9.05	7.80	8.65

An increase in accessibility to downtown and other parts of the region would increase employment along routes. Residents along transit routes could work farther away, potentially increasing their employment opportunities. Over time, development patterns may concentrate along connected routes because of the increased mobility these locations would offer. Additionally, Transit Oriented Development (TOD) near stations along linked routes would become more attractive as accessibility is increased for transit riders. New TOD developments would beneficially impact regional and local economies.

6.0 POTENTIAL MITIGATION MEASURES

The No Build and TSM alternatives are not anticipated to create adverse economic impacts and, therefore, would not require implementation of any mitigation measures.

Mitigation measures for the build alternatives would include:

- Compensation to property owners for acquisition of property in compliance with the Uniform Relocation Assistance and Real Property Acquisition Policies Act of 1970
- Relocation assistance for affected property and business owners in compliance with the California Relocation Act
- Measures to assist business owners significantly impacted by temporary construction activity (temporary parking, marketing programs, and other measures to be identified by Metro working with the appropriate businesses).
- Replacement parking locations and strategies (Metro is committed to implementing a feasible parking replacement plan that would reduce parking impacts to a less than significant level).

7.0 CONCLUSIONS

7.1 No Build Alternative

7.1.1 NEPA Findings

The No Build Alternative would include transit investments already planned in the Metro 2009 LRTP. It proposes no construction or physical changes to the study area. Therefore, this alternative would not create any adverse, economic or fiscal impacts. Given that an LRT system through downtown Los Angeles would not be constructed under the No Build Alternative, economic benefits would not occur in direct and indirect job creation and investment or spending by suppliers whose goods and services are used in a project. Since the No Build Alternative would forego beneficial economic impacts, such as increased employment opportunities or increased direct and indirect revenues that would occur with the development of the build alternatives, an adverse impact could occur on the regional economy.

7.1.2 CEQA Determinations

CEQA guidelines state that the economic effects of a physical change may be used to determine if the change is a significant change to the environment.

The No Build Alternative would not include construction and would not substantially change the physical environment. Therefore, this alternative would have no adverse economic or fiscal impacts and no mitigation measures would be required.

7.2 TSM Alternative

7.2.1 NEPA Findings

The TSM Alternative would include minor transportation improvements. It would not involve substantial physical changes to the environment and, therefore, would not have any adverse economic or fiscal impacts. However, the TSM Alternative would not result in beneficial economic impacts to the extent associated with the other build alternatives.

7.2.2 CEQA Determinations

The TSM Alternative would not involve substantial physical changes and would not create a significant economic or fiscal impact. However, this alternative could permanently displace up to 24 parking spaces to make way for new bus stops. This parking displacement could impact some businesses. It is difficult to estimate the exact impact of the parking displacements because bus station locations have yet to be determined. However, with implementation of mitigation measures, impacts would be reduced to less than significant levels.

7.3 At-Grade Emphasis LRT Alternative

7.3.1 NEPA Findings

The At-Grade Emphasis LRT Alternative would improve transit accessibility and mobility in the region. This could increase economic activity and benefit businesses and employees traveling to and from work. This alternative would decrease transit transfers in the region. This would result in decreased travel times and costs for commuting employees.

Additionally, applying Regional Input-Output Modeling System multipliers, secondary economic impacts of the At-Grade Emphasis Alternative are estimated to produce over $1.9 billion in economic output from construction and operations spending. Total economic output could increase employment by 13,859 jobs and tax revenues by $78 million. This increase in employment and tax revenue would beneficially impact local and regional economies.

7.3.2 CEQA Determinations

Five privately-owned parcels would be acquired for construction of the At-Grade Emphasis LRT Alternative. Acquisition of these parcels would result in annual property tax revenue losses of $186,734. This revenue loss would equal about 0.76 percent of the property tax base of properties that abut the alignment ($24,381,100). Thus, property tax revenue losses would be a less than significant impact. Losses in property tax revenues would likely be offset by increased property values in areas surrounding new stations.

This alternative would have temporary construction-related impacts (between 24-48 months) to local businesses in the project area. These impacts would include dust, noise, street closures, the permanent displacement of up to 80 curb parking spaces and possible sidewalk closures. These impacts could reduce visibility, accessibility and attractiveness of local businesses. Construction impacts would have a significant impact to activity levels and revenue streams of businesses along the alignment.

Approximately 30 businesses could be impacted by construction activity. Implementation of mitigation measures, such as compensation to property for acquisitions and assistance to business owners, would lessen construction impacts. Depending on the success of mitigation measures, some residual impacts could still occur during construction.

Related projects could be under construction during the same time as the proposed alternative. Therefore, construction of this alternative could result in a considerable contribute to cumulative impacts on activity levels and revenue of businesses along the alignment. Project operational impacts would be less than significant, so they would not contribute to cumulative, adverse, economic or fiscal operational impacts.

The At-Grade Emphasis LRT Alternative would create construction-related employment growth, adding up to 13,789 employees to the area economy. However, this growth in employment would be within planned levels and would not represent a significant impact to the economy.

7.4 Underground Emphasis LRT

7.4.1 NEPA Findings

Like the At-Grade Emphasis LRT Alternative, the Underground Emphasis LRT Alternative would improve accessibility and mobility and reduce travel time and costs in the region. This alternative could encourage greater economic activity and would provide benefits for businesses and commuting employees.

The Underground Emphasis LRT Alternative would result in an economic output of $2.8 billion and would increase direct and indirect employment by over 20,789 jobs. This economic growth would be within planned levels for Los Angeles and Los Angeles County. Tax revenues are estimated to increase by $117 million. Increased revenues would result from new jobs and spending on project construction and operations and have beneficial impacts to local and regional economies.

7.4.2 CEQA Determinations

The Underground Emphasis LRT Alternative would require land acquisitions for tunnel boring, station construction, and station sites. Twenty privately-owned parcels would be acquired. Land acquisitions could decrease annual property tax revenues by $286,800 or 1.2% of the property tax base of businesses that abut the proposed alignment. This would be a less than significant impact. Decreased property tax revenues would likely be offset by increased property values in areas surrounding new stations.

The Underground Emphasis LRT Alternative would have temporary construction-related impacts including dust, noise, street closure, the permanent displacement of up to 20 parking spaces and possible sidewalk closures. This could reduce the visibility, accessibility and attractiveness of local businesses.

Construction could affect approximately 38 businesses along the alignment. Implementation of mitigation measures, such as compensation to property owners for acquisitions and assistance to business owners, would lessen construction impacts. Depending on the success of mitigation measures, some residual impacts could still occur during construction.

Related projects could be under construction during the same time as the proposed alternative. Therefore, construction of this alternative could result in a considerable contribute to cumulative impacts on activity levels and revenue of businesses along the

alignment. Project operational impacts would be less than significant, so they would not contribute to cumulative, adverse, economic or fiscal operational impacts.

7.5 Fully Underground LRT – Little Tokyo Variation 1

7.5.1 NEPA Findings

As with the other build alternatives, the Fully Underground LRT Alternative – Little Tokyo Variation 1 would improve accessibility and mobility and reduce travel times and costs in the region. This could encourage greater economic activity and benefit businesses and commuting employees.

The Fully Underground LRT Alternative – Little Tokyo Variation 1 could create a total economic output of over $3.2 billion and increase employment by 23,534 jobs. Such employment growth would be within growth estimates. Overall, an increase in employment and economic output would beneficially impact local and regional economies.

7.5.2 CEQA Determinations

The Fully Underground LRT Alternative – Little Tokyo Variation 1 would generally require the same land acquisitions as the Underground Emphasis LRT Alternative. The exception would be businesses on the block bounded by 1st, Alameda and 2nd Streets, and Central Avenue, and business located on the south side of 1st Street east of Alameda Street. However, Metro intends to maintain some of the existing businesses acquired on Central Avenue between 1st and 2nd Streets that would not be directly impacted by construction activities.

Approximately five businesses along 1st Street could be impacted during construction from street relocation and road work. Implementation of mitigation measures, such as compensation to property owner for acquisitions and assistance to business owners, would lessen construction impacts. Depending on the success of mitigation measures, some residual impacts could still occur during construction.

Land acquisitions would result in property tax losses of approximately $300,900, or 1.2 percent of the tax revenue base of properties abutting the alignment. This would be a less than significant impact. Property tax revenue losses would likely be offset by increases in property values in areas surrounding new stations.

Related projects could be under construction during the same time as the proposed alternative. Therefore, construction of this alternative could result in a considerable contribute to cumulative impacts on activity levels and revenue of businesses along the alignment. Project operational impacts would be less than significant, so they would not contribute to cumulative, adverse, economic or fiscal operational impacts.

7.6 Fully Underground LRT – Little Tokyo Variation 2

7.6.1 NEPA Findings

The Fully Underground LRT Alternative – Little Tokyo Variation 2 would have similar impacts and could utilize similar mitigation measures as the Fully Underground Emphasis LRT Alternative – Little Tokyo Variation 1. It would improve regional connectivity and mobility and reduce travel times and costs region-wide. This could encourage greater economic activity and benefit businesses and commuting employees.

This alternative could produce an economic output of $3.4 billion and increase employment by 25,396 jobs. This alternative would have the greatest regional economic impact of the four build alternatives. Increases in employment and economic output would beneficially impact local and regional economies.

7.6.2 CEQA Determinations

The Fully Underground LRT Alternative – Little Tokyo Variation 2 would require nearly the same land acquisitions as the Fully Underground LRT Alternative – Little Tokyo Variation 1. The exception would be acquisition of two additional parcels on 1st Street between Hewitt and Garey Streets. Property tax revenue losses with this alternative are estimated to be $328,300 or 1.1 percent of the tax revenue base of properties that abut the alignment. This would be a less than significant impact. Losses to property tax revenue would likely be offset by increased property values in areas surrounding new stations.

The Fully Underground LRT Alternative – Little Tokyo Variation 2 would have similar construction-related impacts to local businesses as the Fully Underground LRT Alternative – Little Tokyo Variation 1 because they both generally follow the same alignment. Implementation of mitigation measures, such as compensation to property owners for acquisitions and assistance to business owners, would lessen construction impacts. Depending on the success of mitigation measures, some residual impacts could still occur during construction.

Related projects could be under construction during the same time as the proposed alternative. Therefore, construction of this alternative could result in a considerable contribute to cumulative impacts on activity levels and revenue of businesses along the alignment. Project operational impacts would be less than significant, so they would not contribute to cumulative, adverse, economic or fiscal operational impacts.

B.S., Environmental Science, Pacific Western University (1990)

Wei Guo, Civil Engineer (Plan and Profile Drawings)
B.S., Civil Engineering, Changsha University of Science and Technology (1996)
M.S., Civil Engineering, University of Southern California (2006)

Michael Hsiao, Supervising Engineer (Overhead Contact System Report; Cost Estimating)
M.S., Civil Engineering, M.I.T. (1994)

Mengzhao Hu, Transportation Planner (Travel forecasting, alternative simulation)
B.A. Urban Planning, Tongji University (2003)
Master of Planning, University of Southern California (2005)

Chu-Hwa (Jessica) Sun, Assistant Electrical Engineer (Traction Power Study)
B.S., Electrical Engineering, University of California, Santa Barbara (2008)

Larry Johanson, Sr. Supervising Architect (Station Architectural Design and Urban Design)
Bachelor of Architecture, Washington State University (1969)
M.S., Architecture and Urban Design, Columbia University (1974)

Kevin Keller AICP, Senior Environmental Planner (Noise and Vibration Technical Report)
B.A., Geography, California State University, Fullerton (1987)

Aziz Kohan, Senior Supervising Architect (Station Architectural Design and Urban Design)
M.Arch., Academy of Applied Arts, Vienna, Austria (1966)

John K. Lau, Overhead Contact System Engineer (Overhead Contact System; Cost Estimating)
Structural Steel/Design and Engineering, Merritt College (1974)

Richard W. Leslie, Sr. Supervising Engineer (Train Control Studies)
Institute of Electrical and Electronics Engineers (IEEE); American Railway Engineering and Maintenance of Way Association (AREMA)

Lope Mayola, Sr. Supervising Systems Engineer (Systems Technical Reports; Basis of Design)
B.S., Electrical Engineering, University of San Jose Recoletos (1978)

Heinrich McBean, Lead Transportation Planner (Travel Demand Forecasting; Transportation Planning and Engineering)
M.S., Transportation Planning and Engineering, University of Southampton, UK (2004)

David McBrayer, Principal Professional Associate (Operations and Maintenance Cost Model)
B.A., Architecture (1954)

Zafer Mudar, Senior Supervising Engineer (Alignment review, Plan/Profiles, Civil Support)
B.S., Civil Engineering, Middle East Technical University, Ankara, Turkey (1991)
M.B.A., Louisiana State University, Shreveport, Louisiana (1995)

Arvind Patel, Sr. Supervising Systems Engineer (Traction Power Design Drawings)
B.S., Electronics, Heald Engineering College (1970)
B.S., Electrical Engineering, California State University, Sacramento (1972)

Mahesh Patel, Systems Manager (Managed the Systems Group)
B.S., Electrical Engineering, India Polytechnic (1968)

J. Tucker Rainey, Assistant Engineer (Vertical clearances; ROW drawings)

B.S., Civil Engineering, University of Vermont (2008)

Ahbimanyu Rastogi, Supervising Engineer (Train Control System Technical Memorandum, Operations and Maintenance Facility Technical Memorandum)
B.A.S., Electrical Engineering, University of Ottawa (2004)

Blake Russo, P.E., Supervising Engineer (Communications Technical Memorandum)
B.S., E.E.T (1990)
M.S., Telecommunications (2003)

Stoil D. Stoilov, Sr. Supervising Engineer (Traction Power Load Flow Study; TP report)
E.E. (MS equivalent); Institute of El and Mech Engineering, Sofia, Bulgaria (1974)

Jessica Sun, Assistant Electrical Engineer (Traction Power Technical Report)
B.S., Electrical Engineering, University of California, Santa Barbara (2008)

Shavarsh Yousefian, Sr. Engineer (Utility Design Review)
Undergraduate Degree, Civil Engineering, Tehran University, Iran (1963)

Los Angeles, CA 90014

TABLE OF CONTENTS

1.0 Summary 1
2.0 Introduction 2
3.0 Methodology for Impact Evaluation 4
3.1 Regulatory Framework 4
3.1.1 Federal 4
3.1.1.1 NEPA 4
3.1.1.2 SAFETEA-LU 4
3.1.1.3 FTA New Starts Program 4
3.1.1.4 Fire Services 4
3.1.2 State 5
3.1.2.1 CEQA 5
3.2.2.2 California Public Utilities Commission 5
3.1.2.2 Fire Services 7
3.1.3 Regional/Local 7
3.1.3.1 Los Angeles County Metropolitan Transportation Authority (Metro) 7
3.1.3.2 Los Angeles County 9
3.1.3.3 City of Los Angeles 9
3.2 Standards of Significance 12
3.3 Evaluation Methodology 12
3.3.1 Safety 12
3.3.2 Security 14
4.0 Affected Environment 16
4.1 Safety 16
4.1.1 Pedestrian Safety 17
4.1.2 Existing At-Grade Intersection Conditions 17

1.0 SUMMARY

This technical memorandum identifies, evaluates, and characterizes existing and future safety and security issues within the project area as they relate to passengers, pedestrians, motorists, and the public using the surrounding areas. Safety refers to the prevention of accidents to passengers, pedestrians, motorists, or employees through a formal process of hazard identification, assessment, and resolution. Security refers to the prevention of acts defined as unlawful, criminal, or intended to bring harm to another person or damage property.

This crime and security assessment used available crime statistics for the City of Los Angeles and included a review of other transit systems in the United States that are similar to the Regional Connecter Transit Corridor project alternatives.

The affected environment in the project area is represented by a highly urban environment which, for the most part, provides a substantial and adequate infrastructure to benefit pedestrians and the travelling public. As part of the field work for this analysis, observations were made within the project area to document this infrastructure and identify cursory issues that may need to be addressed as the Regional Connector Transit Corridor project proceeds further in design. The assessment found that the existing infrastructure is generally adequate to accommodate the proposed project from a safety perspective.

The alternatives evaluated include:

- No Build Alternative
- Transportation System Management (TSM) Alternative
- At-Grade Emphasis Light Rail Transit (LRT) Alternative
- Underground Emphasis LRT Alternative
- Fully Underground LRT Alternative – Little Tokyo Variation 1
- Fully Underground LRT Alternative – Little Tokyo Variation 2

Results of the safety and security assessment show there are no significant adverse safety and security impacts associated with project alternatives that could not be mitigated by design refinements. Although some impacts may be more prevalent between alternatives, all impacts can be mitigated by actions identified in Section 6.0 of this technical memorandum. All proposed mitigation measures relevant to safety and security would be developed in conformance with Metro's Rail Transit Design Criteria and Standards, Fire/Life Safety Criteria, Volume IX. Proposed mitigation measures include providing safe detours for pedestrians and motorists around construction zones and implementing project operational modifications to address potential safety and security issues.

2.0 INTRODUCTION

The purpose of this technical memorandum is to identify, evaluate, and characterize existing and future safety and security issues within the project area as they relate to passengers, pedestrians, motorists, and the public using surrounding areas. This analysis focuses on potential safety and security impacts that may result from the proposed Regional Connector Transit Corridor project.

Safety refers to the prevention of accidents to passengers, pedestrians, motorists, or employees through a formal process of hazard identification, assessment, and resolution. Security refers to the prevention of acts defined as unlawful, criminal or intended to bring harm to another person or damage property. Security also means freedom from threats or uncertainty about the likelihood of such acts.

All proposed stations, at-grade intersections along the light rail transit (LRT) alignment, and crossing locations between intersections were assessed for safety and security issues. The major focus of the safety analysis is how the proposed action(s) may affect light rail transit system passengers, employees, and the overall pedestrian environment/infrastructure. The assessment is not a detailed analysis of motorized travel conditions and traffic mitigation in Los Angeles. However, where appropriate, relevant traffic mitigation and/or concerns have been identified if they might influence pedestrian/motorist interactions.

3.0 METHODOLOGY FOR IMPACT EVALUATION

3.1 Regulatory Framework

The following sections briefly discuss the regulatory framework used to guide the evaluation of project safety and security.

3.1.1 Federal

3.1.1.1 NEPA

The National Environmental Policy Act (NEPA) does not include specific guidance or direction for evaluating alternatives and their relative effects on public safety and security.

3.1.1.2 SAFETEA-LU

SAFETEA-LU was passed to address issues such as improving safety, reducing traffic congestion, improving efficiency in freight movement, increasing intermodal connectivity, and protecting the environment. SAFETEA-LU further promotes efficient and effective federal surface transportation programs by focusing on transportation issues of national significance.

Some of the key programs targeted by SAFETEA-LU include safety, equity, innovative finance, congestion relief, mobility and productivity, efficiency, environmental stewardship, and environmental streamlining. SAFETEA-LU gives states more flexibility to use road pricing to manage congestion, and promotes real-time traffic management in all states to improve transportation security.

3.1.1.3 FTA New Starts Program

States with rail fixed guideway systems must comply with Federal Transportation Authority's (FTA) State Safety Oversight Rule. Codified at 49 CFR Part 659, the State Safety Oversight Rule (or Part 659) sets forth FTA's requirements to improve rail transit safety and security. Only those states with rail fixed guideway systems must comply with FTA's State Safety Oversight Rule.

Part 659 requires a state to establish and carry out a safety program plan for rail-based New Starts projects. Part 659 requires safety and security to be considered well before a rail-based New Starts project begins revenue service. Project sponsors must ensure that safety considerations are weighed during the preliminary engineering phase.

3.1.1.4 Fire Services

The Uniform Fire Code (UFC) contains regulations related to construction and maintenance of buildings and use of their premises. Topics addressed in the UFC include fire department access, fire hydrants, automatic sprinkler systems, fire alarm systems, fire and explosion hazards safety, hazardous materials storage and use, provisions intended to protect and assist fire responders, industrial processes, and many other general and specialized fire safety requirements for new and existing buildings and their premises. The UFC contains specialized technical regulations related to fire and human safety.

3.1.2 State

3.1.2.1 CEQA

Appendix G of California Environmental Quality Act (CEQA) Guidelines draws particular attention to those projects that would "create a potential public health hazard" or "interfere with emergency response plans or emergency evacuation plans." In particular, CEQA highlights the following safety and security concerns:

- Pedestrian and/or bicycle safety;
- Safety conditions for users of public transit systems, including station accidents, boarding and disembarking accidents, right-of-way (ROW) accidents, collisions, fires, and major structural failures;
- Delivery of community safety services, such as police, fire, or emergency services, to locations along a proposed alignment; and
- Security conditions, including incidents, offenses, and crimes.

3.2.2.2 California Public Utilities Commission

The California Public Utilities Commission (CPUC) has adopted General Order 143-B (GO 143B), the *Safety Rules and Regulations Governing Light-Rail Transit in California*. The order describes all the general requirements for light-rail transit, including braking, lighting, operating speeds, ROW standards, and maintenance of light-rail vehicles (LRVs). The Regional Connector Transit Corridor project would be subject to rules and regulations set forth by GO 143-B. In accordance with GO 143 B, all LRV equipment shall be maintained in safe and proper working condition. Once the LRT carrier/operator establishes operating rules and procedures, including grade crossings, the CPUC would have final review and approval of the operating plan. The following lists some of the major rules set forth in GO 143-B.

- **Title 5, Section 01—Headlights.** Every LRV that operates on a separate right-of-way shall be equipped with a headlight or headlights that are capable of revealing a person or motor vehicle in clear weather at a distance of 600 feet. Every LRV that operates on a public street or road shall be equipped with a headlight or headlights that are capable of revealing a person or motor vehicle in clear weather at a distance of 350 feet and shall be designed and adjusted so as not to interfere with the vision of drivers of motor vehicle. Headlights may be dimmed or extinguished under conditions where their use could pose a safety hazard to motorists in adjacent traffic lanes.
- **Title 7, Section 01—Basic Speed Rule.** The operator of an LRV shall at all times operate at a safe speed that is consistent with weather, visibility, track conditions, traffic signal indications, and the indication of Automatic Train Protection systems where used.

- **Title 7, Section 08—Crossing of Street and Highways at Grade.** LRT systems that cross streets, roads, and highways at grade shall install and maintain automatic gate crossing signals to control motor vehicle traffic and automatic warning signals to control pedestrian traffic. When LRV operation is on a street or highway that permits motor vehicle traffic, all intersections shall be controlled by traffic control devices.

- **Title 7, Section 09—Audible Warning.** The LRV operator shall sound an audible warning:

  - When approaching at-grade crossings protected by automatic crossing signals conforming to the requirements of General Order 75-C to control vehicle and pedestrian traffic,

  - At other locations specifically identified in the LRT system's operating rules, and

  - Whenever the operator believes it is necessary and in accordance with the LRT system's operating rules and regulations.

- **Title 9, Section 03—Installation of Curbs, Fences, and Barriers.** Concrete curbs, fences, or barriers shall be installed along sections of the separate right-of-way of an LRT system when there is a likelihood that motor vehicles or pedestrians may leave the traveled way of any nearby street or highway and encroach onto a mainline track.

- **Title 9, Section 04—Alignment Classification.**

  - Exclusive: A right-of-way without at-grade crossings that is grade separated or protected by a fence or substantial barrier, as appropriate to the location (includes subways and aerial structures).

  - Semi-Exclusive: (1) Fully exclusive right-of-way with at-grade crossings, protected between crossings by a fence or substantial barrier, if appropriate to the location; (2) within the street right-of-way, but protected by 6-inch-high curbs and safety fences between crossings (the safety fences should be located outside the tracks).

- **Title 9, Section 05—Emergency Walkways.** An unobstructed emergency walkway at least 30 inches wide and accessible to persons getting off disabled trains shall be provided along all tracks in subways and tunnels, on bridges, and on alignment Classifications 9.04a, 9.04b(1), and 9.04b(2). Walkways shall have a reasonably regular surface and shall not have a slope exceeding 1 foot vertical to 6 feet horizontal. A single walkway may serve more than one track.

- **Title 11, Section 01—Fire Protection Requirements.** All LRT systems shall establish fire protection requirements to control potential fire hazards. The minimum requirements for underground segments of the LRT system shall be as specified in the Standards for Fixed Guideway Transit Systems published by the National Fire

Protection Association (NFPA 130). The minimum requirements for all other segments shall be established by the LRT system based upon a documented engineering analysis of the factors affecting fire hazards and fire risks using NFPA 130 as a guide.

3.1.2.2 Fire Services

California Code of Regulations (CCR) Title 24 of the California Building Code (CBC) is a compilation of building standards. State fire regulations are set forth in Section 13000 et seq. of the California Health and Safety Code and include regulations for building standards (as also set forth in the CBC), fire protection and notification systems, fire protection devices such as extinguishers and smoke alarms, and fire suppression training. This code would apply to design criteria for safety of the proposed project.

3.1.3 Regional/Local

Public services (i.e., police and fire protection) are generally regulated by local agencies. Therefore, design of these components and operation of the proposed project alternatives would be regulated primarily by the policies and agencies of Los Angeles County and the City of Los Angeles. Metro also implements policies, plans, and actions specifically directed toward maintaining safety and security during operation of the transit system.

3.1.3.1 Los Angeles County Metropolitan Transportation Authority (Metro)

Metro is responsible for compliance with all FTA and CPUC regulations governing the safe operation of the transit systems, both for patrons and its employees. In operating light-rail transit, subways, and bus transit throughout Los Angeles County, Metro has established departments to address specific issues. Metro relies on the Grade Crossing Policy, revised in December of 2003, for determining appropriate grade separation of LRT. The Metro Emergency Response Plan is incorporated into Metro's standard operating procedures and was established to address the potential for emergencies to occur and the ways in which Metro employees are to respond. Excerpts from both of these documents are provided in the following paragraphs.

Metro Grade Crossing Policy for Light-Rail Transit

The Grade Crossing Policy is intended to provide a structured process for evaluating potential grade separations versus at-grade operation along light-rail lines. The policy describes a three-step process.

Milestone 1: Initial Screening. A preliminary planning-level assessment of roadway crossings based upon readily available, planning-level data for roadway volumes and proposed train frequencies leading to an initial categorization of roadway crossings into three groups: "At Grade Should be Feasible," "Possible At Grade Operation," and "Grade Separation Usually Required."

Milestone 2: Detailed Analysis. This milestone is a detailed evaluation of operations, taking into account peak period, movement-by-movement, analysis of roadway traffic in

conjunction with an assessment of potential impacts to rail operations due to priority control. It provides a more refined assessment of feasibility of at-grade operation and also identifies operational trade-offs between roadway traffic conditions and rail operations. This review includes an initial assessment of safety issues based on site-specific evaluation of geometric conditions and observed and/or projected use of proposed crossings. It results in a preliminary determination of locations that may be operated at-grade versus grade-separated.

Milestone 3: Verification. This step includes the process of developing consensus regarding the proposed design solution with local constituencies, including other involved agencies and the community as appropriate. This step may include preliminary engineering studies and cost estimates for alternative treatments. It may also include refinement of projected traffic volumes and validation of traffic and rail operations using simulation modeling. Finally, it may include additional effort on safety issues and countermeasures. At the conclusion of this milestone, it is expected that all technical studies will have been completed leading to a final recommendation by Metro for the crossing configuration.

Metro Rail Emergency Response Plan

The Emergency Response Plan is intended to establish guidelines for standard operating policy and procedures for the mobilization of Metro employees and resources during an emergency situation. The Plan is shared with other public safety resources and agencies to provide a fast, controlled, and coordinated response to the various emergencies that may occur on the Metro rail system.

The goal of this Plan is to establish guidelines that would impact the fewest number of responders, allowing the emergency situation to be mitigated with as little impact to the system as practicable and service to be restored as quickly as possible. To this end, only the personnel who are essential to respond to a particular emergency situation should be called. As an incident grows, the list of responders may also grow to conduct investigations and provide recovery efforts necessary to restore service.

Certain objectives must be met to implement guidelines in the Emergency Response Plan. They are:

- Minimize potential danger to passengers, employees, and others during emergency incidents.
- Maximize the effectiveness of the Metro during an emergency incident.
- Ensure there is proper investigation into the cause of the incident.
- Restore service or provide alternative service at the earliest possible time.

Fire/Life Safety Design Criteria

The Fire/Life Safety Design Criteria would need to address specific fire protection requirements for design and construction of the Regional Connector Transit Corridor project systems and equipment. The criteria would establish minimum requirements to provide a reasonable degree of safety from fire and its related hazards.

Fire safety on a light-rail transit system is achieved through a composite of facility design, operating equipment, hardware, procedures, and software subsystems that are integrated to provide protection of life and property from the effects of fire. The criteria identify and discuss fire safety as they relate to the following specific design criteria: station and guideway facilities; passenger vehicles: vehicle yard and maintenance facilities: system fire/life safety procedures; communications; rail operations control; and inspection, maintenance, and training.

3.1.3.2 Los Angeles County

The Los Angeles County General Plan includes policies that also affect police and fire services in the project area, including:

- *Police Services*: Policy PS 8.1 promotes phased development, whereby land use proposals are developed in conjunction with approved law enforcement capabilities.
- *Fire Services*: The Los Angeles County Fire Code and the General Plan safety element establish the standards, policies, and goals for fire suppression facilities within the County. In addition, the General Plan includes policies (such as Policy PS 7.1) that promote phased development, whereby land use proposals are developed in conjunction with approved fire protection capabilities.

3.1.3.3 City of Los Angeles

City of Los Angeles General Plan

The City of Los Angeles General Plan Safety Element identifies various goals and policies to improve the overall safety and security of all residents within the City. Specifically, Goal 2 of the General Plan indicates that the City should strive to respond with the maximum feasible speed and efficiency to disaster events to minimize injury, loss of life, property damage, and disruption of the City's social and economic life and its immediate environs. Objective 2.1 of this General Plan Goal further clarifies that the City should develop and implement comprehensive emergency response plans and programs that are integrated with each other and with the City's comprehensive hazard mitigation and recovery plans and programs.

The City's General Plan policies regarding safety and security include:

2.1.1 Coordination. Coordinate program formulation and implementation between City agencies, adjacent jurisdictions, and appropriate private and public entities to achieve, to the greatest extent feasible and within the resources available, the maximum mutual benefit with the greatest efficiency of funds and staff.

2.1.3 Information. Develop and implement, within the resources available, training programs and informational materials designed to assist the general public in handling disaster situations in lieu of or until emergency personnel can provide assistance.

2.1.5 Response. Develop, implement, and continue to improve the City's ability to respond to emergency events.

2.1.6 Standards/fire. Continue to maintain, enforce, and upgrade requirements, procedures, and standards to facilitate more effective fire suppression. The Fire Department and/or appropriate City agencies shall revise regulations or procedures to establish minimum standards for location and expansion of fire facilities based upon fire flow requirements, intensity and type of land use, life hazard, occupancy, and degree of hazard to provide adequate fire and emergency medical event response.

Police Services: While there are no specific local or regional plans that address police services, the City's citywide General Plan framework and specific community plan documents do contain policies and objectives that deal with ensuring adequate police service infrastructure for the Los Angeles Police Department (LAPD).

Fire Services: The City of Los Angeles both surrounds and adjoins other cities, counties, and state and federally controlled lands; therefore, it has joined a variety of mutual aid agreements with other jurisdictions for the cooperative response and management of fires and other emergency incidents. The Los Angeles Fire Department (LAFD) participates in automatic response agreements with the County. The City of Los Angeles General Plan, the City of Los Angeles Fire Code (part of the City's municipal code), and the General Plan safety element contain the goals, objectives, and policies related to fire prevention and suppression services.

City of Los Angeles Community Plans

The project area crosses two designated City of Los Angeles communities: Central City and Central City North. Both of these communities have community plans that have applicable policies for police services and fire services. These policies are discussed in the following paragraphs.

Central City Community Plan

The Central City area is located south of Sunset Boulevard/Cesar Chavez Avenue, north of the Santa Monica Freeway (I-10), east of the Harbor Freeway (SR 110), and west of Alameda Street. Applicable Central City Community Plan policies, listed by community facility type are as follows:

Police Services: Policy 5-1.1 requires consultation with the LAPD during review of development projects and land use changes to determine law enforcement needs and requirements. Programs complementing this policy include requiring decision-makers to address a proposed project's potential demand for police services.

Fire Services: Policy 6-1.1 requires coordination with the LAFD during review of significant development projects to determine potential impacts on fire service demand. Implementation of this policy requires decision-makers to address potential impacts of a development project on fire services and encourages consultation with the LAFD.

Central City North Community Plan

The Central City North area is located adjacent to downtown Los Angeles. The Los Angeles River bounds it on the east; the City of Vernon to the south; Alameda Street, Cesar Chavez Avenue, Sunset Boulevard, and Marview Avenue to the west; and Stadium Way, Lilac Terrace, and North Broadway to the north. Applicable Central City North Community Plan policies, listed by community facility type, are as follows:

Police Services: Policy 8-1.1 requires consultation with the LAPD during review of significant development projects to identify potential impacts on police services.

Fire Services: Policy 9-1.1 requires coordination with the LAFD during review of significant development projects to determine potential impacts on fire services. This policy requires decision-makers to address potential impacts of a proposed project on fire services.

City of Los Angeles Emergency Preparedness Department

In addition to numerous police and fire stations located near the proposed alignments, the City of Los Angeles' Emergency Preparedness Department is responsible for providing citywide emergency management services. The Mayor and City Council established the Emergency Preparedness Department in July 2000 to improve the direction and control of local emergency preparations, response, and recovery activities, and to ensure that the needs of all the citizens of Los Angeles are met in the event of a local emergency.

The Emergency Preparedness Department coordinates the interdepartmental preparedness, planning, training, and recovery activities of the Emergency Operations Organization, its divisions, and all City departments. Additionally, it serves as a liaison with other municipalities, state and federal agencies, and the private sector, and performs related public education and community preparedness activities.

3.2 Standards of Significance

Appendix G of the California State CEQA Guidelines draws particular attention to those projects that would "create a potential public health hazard" or "interfere with emergency response plans or emergency evacuation plans." A significant adverse safety and security impact would occur under CEQA if an alternative would:

- Create the potential for increased pedestrian and/or bicycle safety risks
- Create substantial adverse safety conditions, including station accidents, boarding and disembarking accidents, right-of-way accidents, collisions, fires, and major structural failures
- Substantially limit the delivery of community safety services, such as police, fire, or emergency services, to locations along the proposed alignment
- Create the potential for adverse security conditions, including incidents, offenses, and crimes

3.3 Evaluation Methodology

3.3.1 Safety

A safety assessment includes consideration of potential safety conflicts for pedestrians, bicyclists, transit riders, and automobiles as well as existing conditions of the project area, which is a very heavily used and diverse urban environment. The pedestrian safety assessment along the proposed LRT corridor focused on three separate categories, including:

- Pedestrian safety at station locations
- Pedestrian safety near the trackway

- Pedestrian safety at designated grade crossings

To evaluate these potential issues, other similar conditions were reviewed along existing LRT lines within Los Angeles County. In addition, lessons learned from other system studies were utilized, including TriMet's (Portland, OR) recently published *Light Rail Pedestrian and Bicycle Crossing Final Report* (TriMet 2008). Best practices in safety and security analysis relative to LRT systems were evaluated using guidance contained in the *Transit Cooperative Research Program (TCRP) Report 17 – Integration of Light Rail Transit into City Streets* (Korve Engineering, Inc. 1996), *TCRP Report 69 – Light Rail Service: Vehicular and Pedestrian Safety* (Korve Engineering, Inc. 2001), and *TCRP Report 117 – Design, Operation, and Safety of At-Grade Crossings of Exclusive Busways* (Vanesse, Hangen, Brustlin, Inc. 2007). Input from Metro fire and life safety staff was sought, and information and concerns were gathered at public meetings and during scoping.

Analysis factors were evaluated at appropriate locations such as at intersections, along existing corridors, at proposed station platforms, and near important generators of pedestrian movements such as the Civic Center, the Financial District, and Little Tokyo. In addition, fire services and emergency response factors were taken into account. Station and track design and operational procedures are also pertinent to efficiency in emergency response and were assessed.

Pedestrian and bicycle safety analysis factors considered included, but were not limited to, the following:

- Necessary clearances for boarding platforms and emergency walkways
- Location and adequacy of public street crossings
- Location and adequacy of LRT crossings
- Location and adequacy of barriers (curbs, fences, and vegetation) to channelize pedestrians and bicyclists
- Presence of existing and planned lighting
- Potential for decreased emergency services response times

Mitigation of rail passenger and employee accident potential was evaluated through a process of hazard identification, assessment, and resolution. The number and types of potential accidents for each of the alternatives were estimated based on existing Metro data and other available information. This was expressed in the number of "accidents per mile" (i.e., accident rate) within the corridor. In addition, accident potential was categorized by potential for station accidents, boarding and disembarking accidents, and right-of-way accidents. Developing potential accident rates and data was helpful in identifying possible system concerns that might be mitigated.

System safety factors evaluated included the alignment configuration, engineering safeguards, and the type of control system proposed. System safety documentation prepared previously was reviewed for information appropriate to this environmental document. All proposed grade crossings were evaluated for consistency with the Los Angeles County Metropolitan Transportation Authority (LACMTA) Board adopted *Grade Crossing Policy for Light Rail Transit* (Metro 2003) to ensure safe surface or grade-separated operation.

Other data evaluated for the safety analysis include traffic queuing at select locations; sight distance at intersections and along the proposed LRT alignment, type and availability of pedestrian/patron stacking areas, overall area geometrics, readability/delineation of proposed signing and pavement markings, and overall operational observations.

3.3.2 Security

Security refers to prevention of acts defined as unlawful, criminal, or intended to bring harm to another person or damage property. The project alternatives, including proposed station areas, operational parameters, and surrounding neighborhoods, were evaluated to determine potential for crime risks.

To fully evaluate the security risks, a Threat and Vulnerability Analysis (TVA), following FTA (FTA C 5800.1 and FTA Project Management Guidelines, Chapter 2) and Metro protocols, will ultimately be conducted for the selected locally preferred alternative. That process will give a more refined and detailed analysis of the security environment by identifying domestic and international security threats and potential vulnerabilities/shortcomings in the transit system, and result in recommendations to reduce those vulnerabilities to acceptable levels.

The process for determining vulnerabilities begins with identifying and grouping transit agency assets based on their criticality to transit operations, their attractiveness as targets for security breaches or terrorist attack, and their vulnerability to the impacts of a successful breach or act of terrorism. Critical assets are defined as the specific assets most critical to Metro's ability to provide transit services and to protect people.

Threat types are then identified using existing crime statistics for the area and threat information received from local, state, and federal law enforcement sources. Each critical asset is then assessed for its vulnerability to each potential threat, coupled with the probable frequency of occurrence for each threat. Severity of consequences for each threat is then given a rating from catastrophic to negligible.

This information is put into a criticality matrix, which organizes the resulting consequences into categories of high, serious, and low. The matrix helps to prioritize consequences and focus available resources on the most serious threats requiring resolution while effectively managing the available resources.

To evaluate security risks of the proposed alternatives, interviews were conducted with the Metro Security team including representatives of the LAPD and U.S. Homeland Security, to determine current protocols; identify and document current crime statistics around existing

Metro rail stations and major bus stops in the project area; identify project-likely crime issues around the proposed LRT stations; and identify design factors that may maximize the security of the expected patrons and pedestrians around station areas. Comparative crime statistics from Metro's recent experience with the Metro Gold Line to Pasadena and Metro Orange Line, along with statistics from other Metro urban area LRT systems and metropolitan areas in the United States, were reviewed to help identify potential effects on neighborhood crime and security with the proposed operating facilities. Crime data for the areas surrounding the proposed alignment compared to other existing Metro station area neighborhoods and other urban LRT systems similar to this project would be incorporated in the Threat and Vulnerability Assessment.

Mitigation measures were identified that could be incorporated into the security plan for the locally preferred alternative. The measures identify possible threats and propose appropriate actions to minimize potential impacts of the project.

4.0 AFFECTED ENVIRONMENT

Existing conditions along the Regional Connector Transit Corridor alternatives alignments were assessed to establish a baseline by which alternatives could be evaluated. For purposes of safety and security, this evaluation was performed on a qualitative basis. The assessment of existing conditions centers on safety of pedestrians, LRT passengers, and employees; response times for emergency services (police, fire, and ambulance); crime and security statistics; and other relevant data as available through Metro and other sources.

4.1 Safety

Metro is the regional agency that serves as transportation planner and coordinator, designer, builder, and regional operator of transit services in Los Angeles County. Metro is regulated by the CPUC. In operating LRT, subways, and bus transit (including dedicated bus transit ways) throughout Los Angeles County, Metro has established departments to address specific issues. One department is the Transit Education Programs Department, which works to create programs to educate the public on proper safety practices with respect to LRT.

To improve the safety of passengers and pedestrians, Metro operates all transit-related vehicles according to the guidelines established by the CPUC. The CPUC sets requirements for vehicle and pedestrian crossing gates to discourage pedestrians and motorists from crossing tracks when an LRV is approaching.

Other general safety regulations established by the CPUC for LRV include rear view mirrors, audible warning devices, and grab handles for standing passengers. The CPUC also regulates LRV braking, lighting, and operating speeds.

Separating the tracks from street level reduces potential for conflict between vehicles and LRVs. Metro has also established a Grade Crossing Policy for LRT that establishes a three-step analysis to determine the required grade crossing (at-grade or grade-separated) along light-rail alignments. Additional programs, such as the Rail Safety Education Program, educate local residents, specifically children, on safety around LRVs.

Metro is constantly working to improve passenger and bystander safety along its current LRT lines. There are a variety of programs established by Metro to educate rail users and nonusers alike about proper safety precautions around operating transit vehicles. The transit safety team offers courses aimed at improving passenger and bystander safety. Photos and video from existing stations and rail crossings along the Blue and Gold Lines are used to illustrate safety around rail alignments and rail crossings.

Additionally, the Rail Safety Orientation Safety Program offers guided tours for students, including safety and system information and limited rides on the Gold, Red, and Blue Lines. While most of the education and training is geared toward elementary and middle school students, the transit safety team also works with community organizations to educate local residents on the proper safety procedures and precautions around LRVs.

In addition to safety considerations for the day-to-day operations of the LRT lines, safety must also be considered during construction activities for the LRT infrastructure. During construction, precautions must be made for the safety of pedestrians, bicyclists, motor vehicle drivers, and construction workers. In many cases, interim modifications to sidewalks, parking areas, travel lanes, and traffic control signing must be made to advise the public of construction activities. Depending on the type of construction, and also the construction sequencing, temporary barricades and fencing may be necessary to prevent specific travel movements that may create pedestrian and vehicle circulation hazards. Security measures would have to be in place when construction activities expose underground utilities and/or when excavated trenches have been created and left in an open state. These conditions often require temporary, secure barricades during the night time hours when construction personnel are not on site.

Construction methods and sequencing may also affect emergency service response times. Construction traffic control planning would be utilized during construction activities to coordinate temporary route modifications such that emergency service providers can plan ahead and minimize potential delays in response times due to LRT construction activities.

4.1.1 Pedestrian Safety

Downtown Los Angeles contains a great diversity of streets, places, buildings, and environments. Adding an LRT connection along the Flower and 2nd Street alignment may have the effect of increasing potential safety conflicts for pedestrians, bicyclists, transit riders, and automobiles within some of the most heavily used portions of downtown Los Angeles. There is a high level of pedestrian traffic in the project area. Pedestrian density is most concentrated in the vicinity of the commercial and governmental facilities in the Civic Center and Financial Districts.

4.1.2 Existing At-Grade Intersection Conditions

The following sections describe the existing at-grade intersection conditions applicable to pedestrian safety within the project area. These existing conditions would inform the design process and proposed mitigations to address pedestrian and motorist safety concerns.

4.1.2.1 Flower Street and 6th Street (Photo 1)

- This intersection has marked crosswalks on all four legs of the intersection.
- Diagonal wheelchair ramps are present on all corners of the intersection. Note that there is only a single wheelchair ramp per corner, and is generally pointing toward the middle of the intersection

- Crosswalks are colored asphalt with a stamped brick pattern. Stamped pattern is absent for the path connecting the diagonal wheelchair ramps, presumably to provide a smooth travel surface for wheelchair users.
- Intersection is well lit, with street lighting present on all four corners.
- 6th Street is a one-way facility in the eastbound direction and traffic at this location, on 6th, is primarily from the SR 110 freeway off-ramps. This can cause elevated travel speeds in the eastbound direction which may be a concern to pedestrians.

Photo 1 - The west leg of 6th Street carries one-way traffic from SR 110. Vehicle speeds were observed in the field to be higher than would be expected in a downtown environment.

4.1.2.2 Flower Street and 5th Street (Photo 2)

- This intersection has marked crosswalks on all four legs of the intersection.
- Wheelchair ramps are present on all corners of the intersection. Note that there is only a single wheelchair ramp per corner for three of the corners, and it generally points toward the middle of the intersection. The southeast corner of the intersection does have two wheelchair ramps lining up with the appropriate crosswalk across the relevant leg of the intersection.

Photo 2 - The west leg of 5th Street carries one-way traffic to SR 110.

- Crosswalks are colored asphalt with a stamped brick pattern. Stamped pattern is absent for the path connecting the diagonal wheelchair ramps, presumably to provide a smooth travel surface for wheelchair users.

- Intersection is well lit, with street lighting present on all four corners.
- 5th Street is a one-way facility in the westbound direction and traffic at this location, on 5th, is primarily heading west to enter the US 110 freeway on-ramps. This can cause elevated travel speeds in the westbound direction, which may be a concern to pedestrians.
- There is a pedestrian grade-separated crossing over the west leg of 5th Street that connects to the Westin Hotel complex located on the northwest corner of the intersection.

4.1.2.3 Flower Street and 4th Street (Photo 3)

- This intersection has marked crosswalks on all four legs.
- Wheelchair ramps are present on all corners of the intersection. Note that there is only a single wheelchair ramp per corner, and is generally pointing toward the middle of the intersection.
- Crosswalks are colored asphalt with a stamped brick pattern. Stamped pattern is absent for the path connecting the diagonal wheelchair ramps, presumably to provide a smooth travel surface for wheelchair users.
- Intersection is well lit, with street lighting present on all four corners. Pedestrian facilities are shaded and dark at times because of the overpasses on the north leg of the intersection.

Photo 3 - The intersection of Flower Street and 4th Street is essentially a "tee" intersection because the south leg serves a parking garage access. The overall intersection is dark with limited pedestrian sight distance due to bridge piers.

Ped4.1.2.4 Flower Street and 3rd Street (Photo 4)

- This intersection has marked crosswalks on all four legs.
- Pedestrian push buttons are not consistent on each signal standard.
- Wheelchair ramps are present on all corners of the intersection. Note that there is only a single wheelchair ramp per corner, and it generally points toward the middle of the intersection.

Photo 4 - The Flower Street and 3rd Street intersection has excellent sight distance and is very open. The east leg begins the uphill grade to Bunker Hill.

- The north leg of the intersection has a raised median that extends into the crosswalk. This raised median does not have an accessible wheelchair lay-down.
- Crosswalks are colored asphalt with a stamped brick pattern. Stamped pattern is absent for the path connecting the diagonal wheelchair ramps, presumably to provide a smooth travel surface for wheelchair users.
- Intersection is well lit, with street lighting present on all four corners.
- 3rd Street is a one-way facility in the westbound direction. This can cause elevated travel speeds in the westbound direction, which may be a concern to pedestrians.
- The World Trade Center is on the southwest corner of the intersection.

4.1.2.5 Flower Street/Hope Street and Kosciuszko (Photo 5)

- Sight distance issues exist approaching the intersection from the south due to the steep approach grade of the roadway.
- A five-legged intersection exists at this location, creating a rather large, unfriendly crossing for pedestrians.
- Triple left turns onto Kosciuszko travelling eastbound. As a result, there is no pedestrian crossing across the northwest leg of the intersection. There are "no pedestrian crossing" signs at this location.
- There are pedestrian crosswalks across remaining three legs. These are only marked with white thermoplastic bars (i.e., no colored or stamped asphalt).
- Intersection is well lit, with street lighting present on all four corners.

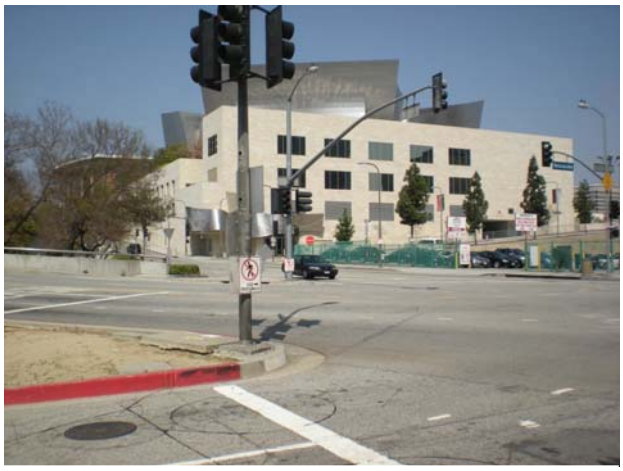

Photo 5 - Flower Street/Hope Street and Kosciuszko intersection is difficult to navigate as a pedestrian due to prohibited crossings, poor sight distance, and skewed intersection geometry.

- Sidewalk infrastructure is aging, with various degrees of concrete settlement on the corners of the intersection where pedestrians are present.

- Wheelchair ramps are present on all corners of the intersection, except across the northwest leg of the intersection (i.e., eastbound Kosciuszko). Note that there is only a single wheelchair ramp per corner, and it generally points towards the middle of the intersection.

4.1.2.6 2nd Street and Hope Street (Photo 6)

- This intersection is located just north of the intersection of Kosciuszko and Hope Street. It is located at the western corner of the Disney Concert Hall block. The Disney Concert Hall is a significant pedestrian generator in this area.

- There is only one pedestrian crossing opportunity at this intersection, located on the east leg of 2nd Street. This crossing is marked with white thermoplastic bars (i.e., no colored or stamped asphalt).

- Intersection is well lit, with street lighting present on all corners.

Photo 6 - Hope Street and 2nd Street provides for a pedestrian crossing on the east leg of the intersection only.

- Sidewalk infrastructure is aging, with various degrees of concrete settlement on the corners of the intersection where pedestrians are present.

- Wheelchair ramps are present on two corners and line up appropriately with the crosswalk alignment.

4.1.2.7 2nd Street and S. Grand Avenue (Photo 7)

- The intersection of 2nd Street and South Grand Avenue is newly constructed and located at the south corner of the Disney Concert Hall block. The Disney Concert Hall is a significant pedestrian generator in this area.

- The intersection includes marked crosswalks on all four legs, of various widths. These crossings are marked with white thermoplastic bars (i.e., no colored or stamped asphalt).

- On the Disney Concert Hall block, a vast pedestrian stacking area exists near the northern corner of the intersection.
- The intersection uses pedestrian countdown timers for pedestrian signalization control.
- Wheelchair ramps are present on all corners of the intersection. Note that there is only a single wheelchair ramp per corner, and is generally pointing toward the middle of the intersection. The exception to this is the southern corner of the intersection, which exhibits two wheelchair ramps in line with the adjacent crosswalks across the intersection legs.

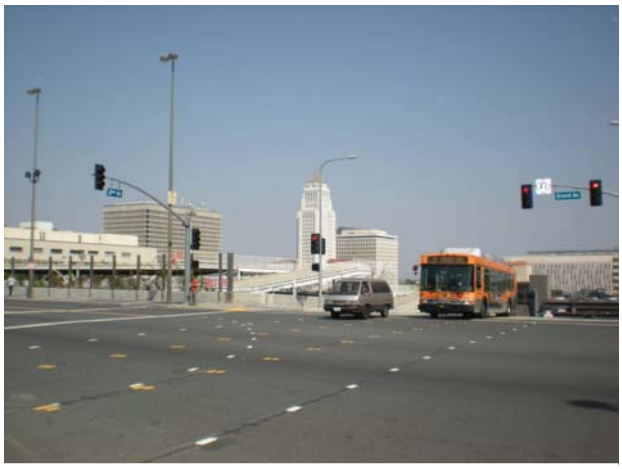

Photo 7 - 2nd Street and S. Grand Avenue is near the Walt Disney Concert Hall – a very large pedestrian generator.

- Intersection is well lit, with street lighting present on all corners.

4.1.2.8 2nd Street and S. Olive Street (Photo 8)

- There is no pedestrian crossing on the north leg of the intersection. This is because of the eastbound double left turning movements coming off the west leg of 2nd Street. There are "no pedestrian crossing" signs at this location directing pedestrians to the other crosswalks.
- Crosswalks of various widths are marked on three legs of the intersection. These crossings are marked with white thermoplastic bars (i.e., no colored or stamped asphalt).
- Wheelchair ramps are present on all corners of the intersection. Note that there is only a single wheelchair ramp per corner, and is generally pointing toward the middle of the intersection. The exception to this is the southern corner of the intersection, which exhibits two wheelchair ramps in line with the adjacent crosswalks across the intersection legs.

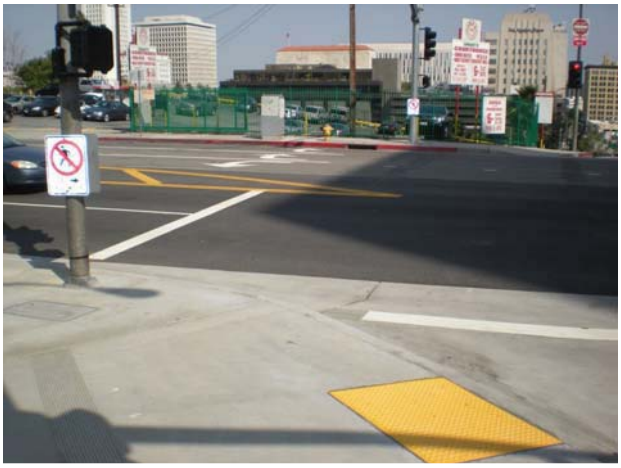

Photo 8 – Pedestrian movements are prohibited across the north leg of the intersection due to the protected green phase for the dual left turns off of the west leg of 2nd Street.

- Intersection is well lit, with street lighting present on all corners.

4.1.2.9 2nd Street and Hill Street (Photo 9)

Photo 10 – The intersection of 2nd Street and Broadway includes adequate pedestrian crossing features on all legs. There are vehicle turning restrictions during peak hours due to heavy traffic flows

- This intersection has marked crosswalks on all four legs.
- Diagonal wheelchair ramps are present on all corners of the intersection. Note that there is only a single wheelchair ramp per corner, and is generally pointing toward the middle of the intersection.
- Crosswalks are colored asphalt with a stamped brick pattern. There is no smooth surface within the stamped pattern connecting the diagonal wheelchair ramps, as encountered in other area intersections.
- Intersection is well lit, with street lighting present on all four corners.
- 2nd Street and Upper 2nd Street converge as the west leg at this intersection. 2nd Street is an existing tunnel in the eastbound direction, while Upper 2nd Street traverses down a hill with the top at Olive Street and the bottom at Hill Street. Where these two facilities converge, there is a concrete median extension that is in disrepair and not suitable as a pedestrian stacking refuge.

4.1.2.10 2nd Street and Broadway (Photo 10)

- This intersection has marked crosswalks on all four legs.
- Diagonal wheelchair ramps are present on all corners of the intersection. Note that there is only a single wheelchair ramp per corner, and is generally pointing toward the middle of the intersection.
- Crosswalks are colored asphalt with a stamped brick pattern. There is no smooth surface within the stamped pattern connecting the diagonal wheelchair ramps, as is encountered in other area intersections.
- Intersection is well lit, with street lighting present on all four corners.
- The actual intersection, within the areas bounded by the colored stamped crosswalks, is comprised of colored concrete materials. This can cause a slick surface during storm events because vehicles may slide into the intersection crosswalks–a potential concern for pedestrians.

4.1.2.11 2nd Street and Spring Street (Photo 11)

Photo 11 – The intersection of 2nd Street and Spring Street exhibits varying degrees of infrastructure repair - potentially causing safety concerns for pedestrians and bicyclists.

- This intersection has marked crosswalks on all four legs.
- Diagonal wheelchair ramps are present on all corners of the intersection. Note that there is only a single wheelchair ramp per corner, and is generally pointing toward the middle of the intersection.
- Crosswalks are of various widths. The crossings are marked with white thermoplastic bars (i.e., no colored or stamped asphalt).
- The intersection surfacing is a mix of asphalt and concrete surfacing in various stages of disrepair. This can present a tripping hazard to pedestrians crossing the intersection.
- Intersection is well lit, with street lighting present on all four corners.

4.1.2.12 2nd Street and Main Street (Photo 12)

Photo 12 – 2nd Street and Main Street is adjacent to the Caltrans building. All legs of this intersection have marked crosswalks.

- This intersection has marked crosswalks on all four legs.
- Diagonal wheelchair ramps are present on all corners of the intersection. Note that the north and east corners of the intersection each have two wheelchair ramps, in line with the adjacent crosswalks. The south and west corners only have a single wheelchair ramp per corner, and it generally points toward the middle of the intersection.
- Crosswalks are of various widths. The crossings are marked with white thermoplastic bars (i.e., no colored or stamped asphalt).
- This intersection is next to a large pedestrian traffic generator–the CalTrans building. The intersection is located at the west corner of the CalTrans block.

- Intersection is well lit, with street lighting present on all four corners.

4.1.2.13 2nd Street and Los Angeles Street (Photo 13)

- This intersection has marked crosswalks on all four legs.
- Diagonal wheelchair ramps are present on all corners of the intersection. Note that the north corner of the intersection has two wheelchair ramps, in line with the adjacent crosswalks. The remaining three corners only have a single wheelchair ramp per corner, and it generally points toward the middle of the intersection.

Photo 13 – 2nd Street and Los Angeles Street is also adjacent to the Caltrans building. All legs of this intersection have marked crosswalks of inconsistent widths.

- Crosswalks are of various widths. The crossings are marked with white thermoplastic bars (i.e., no colored or stamped asphalt).
- This intersection is next to a large pedestrian traffic generator–the CalTrans building. The intersection is located at the south corner of the CalTrans block.
- Intersection is well lit, with street lighting present on all four corners.

4.1.2.14 2nd Street and San Pedro Street (Photo 14)

- This intersection is a "gateway" to the Little Tokyo neighborhood.
- The intersection has marked crosswalks on all four legs.
- Diagonal wheelchair ramps are present on all corners of the intersection and generally point toward the middle of the intersection.

Photo 14 – The 2nd Street and San Pedro Street intersection is a gateway to the Little Tokyo neighborhood.

- The crosswalks are all very wide and imprinted with a unique gridded pattern cut into the asphalt that is filled in with colored epoxy filler. In addition, purple designs are prevalent at numerous locations in each crosswalk.

- This is an important intersection into the neighborhood, with high aesthetic value. It is part of a recent and on-going redevelopment area (Weller Court and adjacent housing).

4.1.2.15 2nd Street and Central Avenue (Photo 15)

- This intersection is located in the Little Tokyo neighborhood.
- This intersection has marked crosswalks on all four legs.
- Diagonal wheelchair ramps are present on all corners of the intersection and generally point toward the middle of the intersection for three of the corners. At the northeast corner are two wheelchair ramps that are in line with the adjacent crosswalk direction.

Photo 15 – 2nd Street and Central Avenue, in the heart of the Little Tokyo neighborhood, exhibits the unique imprinted crosswalks found throughout the newer intersections in the area.

- The crosswalks are all very wide and are imprinted with a unique gridded pattern cut into the asphalt that is filled in with colored epoxy filler. In addition, purple designs are prevalent at numerous locations in each crosswalk.
- This is an important intersection in the neighborhood, with high aesthetic value. It is clustered with adjacent mixed land uses.

4.1.2.16 1st Street and Alameda Street (Photo 16)

- This intersection was recently re-constructed due to the Gold Line extension construction. The intersection is quite large as compared to most others along the alignment.
- This intersection has marked crosswalks on all four legs.
- Diagonal wheelchair ramps are present on all corners of the intersection. Note that there is only a single wheelchair ramp per corner, and is generally pointing toward the middle of the intersection.

- Crosswalks are colored asphalt with a stamped brick pattern. There is no smooth surface within the stamped pattern connecting the diagonal wheelchair ramps, as encountered in other area intersections.
- Intersection is well lit, with street lighting present on all four corners.
- This is an important intersection in the area for pedestrians because it is near the new Little Tokyo station, which is a major future destination and exhibits large traffic flows.
- New raised median on the east leg of the intersection provides a curb cut through the median for unimpeded wheelchair access.

Photo 16 – The corner of 1st Street and Alameda Street is a fairly large intersection and was recently reconstructed due to the Gold Line LRT construction. The Little Tokyo/Arts District Station can be seen in the background.

4.1.2.17 Temple Street and Alameda Street (Photo 17)

- This intersection is located just north of the new Little Tokyo/Arts District Station. The Gold Line to East Los Angeles, which began operation in the Fall of 2009, crosses the east leg of this intersection.
- This intersection was also reconstructed due to construction of the adjacent LRT facilities.
- This intersection has marked crosswalks on all four legs.
- Diagonal wheelchair ramps are present on all corners of the intersection. Note that there is only a single wheelchair ramp per corner, and is generally pointing toward the middle of the intersection.

Photo 17 – The intersection of Temple Street and Alameda Street is located directly adjacent to the Little Tokyo LRT station. Crosswalks are provided on all four legs of the intersection.

- Crosswalks are colored asphalt with a stamped brick pattern. There is also a smooth surface within the stamped pattern connecting the diagonal wheelchair ramps, as encountered in other area intersections.
- Intersection is well lit, with street lighting present on all four corners.
- This is an important intersection in the area for pedestrians because it is near the new Little Tokyo station, which is a major future destination and exhibits large traffic flows.
- The sidewalk on the southwest corner of the intersection is very narrow and undulates in grade due to several abandoned driveway accesses.

4.1.2.18 Temple Street and Judge John Aiso Street (Photo 18)

- The corner of Temple Street and Judge John Aiso Street is three-legged "tee" intersection. There is no north leg to the intersection.
- The intersection is adjacent to the Federal Building complex and accordingly is a large pedestrian traffic generator.
- There are marked crosswalks on two (south and east) legs of the intersection.
- The west leg of the intersection does not contain a marked crosswalk, and signage is present to divert pedestrians to the south and east leg crossings.

Photo 18 – The intersection of Temple Street and Judge John Aiso Street is adjacent to the Federal Building complex.

- Diagonal wheelchair ramps are present on the southwest and southeast corner of the intersection, pointing toward the middle of the intersection. There is also a curb lay-down on the north side of the east leg for pedestrians approaching or leaving the Federal Building complex.
- Vehicles at this area of Temple Street were observed queuing up from the intersection of Temple Street and Los Angeles Street all the way back to Judge John Aiso Street (west leg). This is currently not a large concern because there is no pedestrian crosswalk across the affected (west) leg of the intersection).
- Intersection is well lit, with street lighting present on all four corners.

4.1.2.19 Temple Street and Los Angeles Street (Photo 19)

- The corner of Temple Street and Los Angeles Street is a four-legged intersection next to the Los Angeles Mall and near the City Hall complex.
- There are marked crosswalks on all four legs of the intersection.
- Diagonal wheelchair ramps are present on all of the intersection corners. There is only one ramp per corner and it points toward the middle of the intersection.
- Crosswalks are colored asphalt with a stamped brick pattern. There is also a smooth surface within the stamped pattern connecting the diagonal wheelchair ramps, as encountered in other area intersections.

Photo 19 – The intersection of Temple Street and Los Angeles Street is adjacent to City Hall. Vehicle queuing was observed to back up into pedestrian crosswalks during peak time – a potential safety concern.

- Vehicles at this area of Temple Street were observed queuing up from the intersection of Temple Street and Main Street all the way back to Los Angeles Street (northwest leg). This causes potential motorist/pedestrian conflict because vehicles were stacked in the crosswalk as pedestrians attempted to cross. This situation was observed in the PM peak hour of the day.
- Intersection is well lit, with street lighting present on all four corners.
- A grade-separated pedestrian crossing is located over the northwest leg of the intersection.

4.1.2.20 Temple Street and Main Street (Photo 20)

- This intersection has four legs.
- There are marked crosswalks on all four legs of the intersection.
- Diagonal wheelchair ramps are present on all of the intersection corners. There is only one ramp per corner and they each point toward the middle of the intersection.

- Crosswalks are colored asphalt with a stamped brick pattern. There is also a smooth surface within the stamped pattern connecting the diagonal wheelchair ramps, as encountered in other area intersections.
- Vehicles at this area of Temple Street were observed queuing up from the intersection of Temple Street and Spring Street, all the way back to Main Street (northwest leg). This causes potential motorist/pedestrian conflict because vehicles were stacked in the crosswalk as pedestrians attempted to cross. This situation was observed in the PM peak hour of the day.

Photo 20 – The intersection of Temple Street and Main Street is located in the general vicinity of City Hall, and vehicle queuing was observed to back up into pedestrian crosswalks during the PM peak time – a potential safety concern.

- Intersection is well lit, with street lighting present on all four corners.

4.1.2.21 1st Street and Los Angeles Street (Photo 21)

- This intersection has four legs and is located next to the CalTrans and LAPD complex.
- There are marked crosswalks on all four legs of the intersection.
- Diagonal wheelchair ramps are present on all of the intersection corners. There is only one ramp per corner and each points toward the middle of the intersection.
- Crosswalks are not colored or textured, and consist of white thermoplastic markings for delineation.
- There are quite a few mature shade trees directly in front of the LAPD complex. These cause darkened conditions at times.

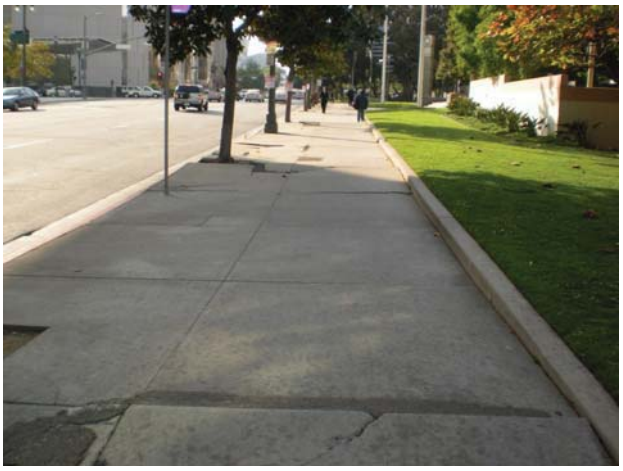

Photo 21 – Uneven and fractured concrete sidewalk, likely caused by boulevard tree roots, can be a pedestrian safety issue due to tripping hazards. This photo shows the sidewalk at the intersection of 1st Street and Los Angeles Street.

- The northwest leg of the intersection, on the north side of 1st Street, contains uneven and fractured concrete in various stages of disrepair. This is primarily caused by the root system of adjacent boulevard trees next to the curb line.
- Intersection is well lit, with street lighting present on all four corners.

4.1.2.22 1st Street and Main Street (Photo 22)

- This four-legged intersection is next to City Hall.
- There are marked crosswalks on all four legs of the intersection.
- Diagonal wheelchair ramps are present on all of the intersection corners. There is only one ramp per corner and each points toward the middle of the intersection.
- Crosswalks are not colored or textured, and consist of white thermoplastic markings for delineation.
- Intersection is well lit, with street lighting present on all four corners.

Photo 22 – 1st Street and Main Street exhibit marked pedestrian crosswalks on all four legs to the intersection. The intersection is near City Hall.

4.1.2.23 1st Street and Rose Street (Photo 23)

- The corner of 1st Street and Rose Street is a three-legged "T" intersection. The Metro Gold Line traverses through the intersection in an east-west orientation.
- Pedestrian crossings are allowed on the south leg of the intersection (Rose Street).
- Intersection contains a light standard on both the southwest and southeast corners.

Photo 23 – 1st Street and Rose Street is a "T" intersection. The Metro Gold Line traverses in an east-west direction (behind rail in photo).

4.1.2.24 1st Street and Hewitt Street (Photo 24)

- The corner of 1st Street and Hewitt Streetis a four-legged intersection. The Metro Gold Line traverses through the intersection in an east-west orientation.
- Pedestrian crossings are allowed on all four legs of the intersection and crosswalks are marked with single white transverse lines.
- Intersection is signalized and contains light standards on all intersection corners.

Photo 24 – The corner of 1st Street & Hewitt Street is a four-legged intersection. Pedestrian crossings are allowed across all intersection legs.

4.1.2.25 1st Street and Garey Street (Photo 25)

- 1st Street and Garey Street meet in a three-legged "T" intersection. The Metro Gold Line traverses through the intersection in an east-west orientation.
- Pedestrian crossings are allowed on the south leg of the intersection (Garey Street).

Photo 25 – The corner of 1st Street & Garey Street is a "T" intersection. Pedestrian crossings are allowed on the south leg. Intersection is unmarked.

4.1.2.26 1st Street and Vignes Street (Photo 26)

- This is a four-legged intersection.
- There are marked crosswalks on three legs of the intersection. The east leg of the intersection has no marked crosswalk because pedestrian crossing is prohibited.
- Intersection is signalized, with street lighting present on all four corners.

Photo 26 – 1st Street and Main Street exhibits marked pedestrian crosswalks on three legs. Pedestrian crossing is prohibited along the east leg.

4.2 Security

The affected environment is the security on the rail system, both at the stations and in the light rail vehicles. Passengers, transit employees, vendors, contractors, and the general public who come in contact with the system as well as the transit property and equipment, would be susceptible to the same crimes as experienced in the surrounding neighborhoods of all four alternative alignments.

Features included for passenger security are closed-circuit television cameras (CCTV), emergency call boxes, and fully lighted station stops and transit parking areas. These features are within all trains and buses, as well as rail stations, and are designed to offer security and a personal sense of well being for passengers.

The CCTV video in trains is recorded to a Digital Video Recorder (DVR), which is then made available for upload by the Los Angeles County Sheriff's Department's (LACSD) in the event of an incident. If no incident is reported, the video is erased after 3 days. As opposed to the CCTV on trains, the CCTV that monitors rail stops is connected directly to the Metro Control Center, where it is viewed in real time by Metro personnel. If an incident is occurring, Metro transit security is notified. Emergency call boxes in trains connect passengers directly to the train operators while those in stations connect directly to Metro central control.

Additionally, Metro personnel receive Community Emergency Response Training in collaboration with the LAFD. This training includes earthquake awareness, disaster medical procedures, and rescue operations. Security statistics for Metro can be found in Table 4-1.

As is the case with the safety considerations described in Section 4.1, security must also be considered during construction activities for the LRT infrastructure. Depending on the type of construction, and also the construction sequencing, temporary barricades and fencing may be necessary to provide an obstruction thus preventing unauthorized personnel from entering construction areas, especially after hours and/or when construction is dormant. This is especially important when construction activities expose underground utilities and/or when excavated trenches have been created and left in an open state. Coordination with police and

fire service providers, regarding construction schedules and how emergency service providers will serve the area during periods of construction, must be made prior to and during construction.

4.2.1 Police Service Areas

The Regional Connector Transit Corridor project would be located in downtown Los Angeles. The LAPD has primary policing responsibility for this area. The LACSD's Transit Services Bureau, the second largest transit services bureau in the country, already provides exclusive contract police services to Metro, which operates the public transit system serving Los Angeles County, one of the country's largest, most populous counties. Deputies provide police services for both the light rail and bus transportation systems throughout 1,433 square miles. The contract with LACSD would be extended to cover the Regional Connector.

Both the LAPD and LACSD are active members of the Regional Transit Security Working Group. Through this working group these agencies coordinate activities and police functions, such as the April 2007 multi-agency security exercise around Union Station.

4.2.1.1 Los Angeles County Sheriff Department

The LACSD currently employs approximately 9,474 sworn peace officers and 7,738 professional staff. The LACSD is comprised of 11 divisions, which provide law enforcement services to 40 contract cities, 90 unincorporated communities, 9 community colleges, Metro, and 48 superior courts (Metro 2009).

In addition to the safety and security measures established by Metro to improve passenger and public safety, Metro contracts with the LACSD to provide law enforcement across the entire Metro system. The Metro system encompasses three LRT systems (the Blue Line, the Gold Line, and the Green Line), two subways (the Red Line and the Purple Line), four dedicated bus transitways (the Orange Line, the Harbor Transitway, the Wilshire Rapid Express, and the Hawthorne Rapid Express), and 191 bus routes over a 1,433 square-mile service area.

Table 4-1. Summary of Part 1 Crimes Reported for Metro System

Type of Part I Crime	Year			
	2003	2004	2005	2006
Criminal Homicide	1	0	0	0
Forcible Rape	1	6	3	7
Robbery	189	341	351	344
Aggravated Assault	91	145	215	199

Burglary	8	35	26	29
Larceny Theft	283	524	602	498
Grand Theft Auto	113	221	208	150
Arson	3	3	3	4
Total Part I Offenses	*689*	*1,275*	*1,408*	*1,231*

Source: Metro 2009

LACSD security personnel and deputies patrol the transit system routes and stations. LACSD security personnel work primarily on fare evasion and passenger complaints. While these officers cover the entire Metro system, they focus on specific patrol routes that experience more fare evasion and customer complaints.

Sheriff's deputies, both uniformed and undercover, patrol all vehicles of the Metro-operated LRT systems, as well as all Metro-operated buses, bus transitways, and subway systems. Deputies respond to fare evasion and minor complaints, but also respond to serious crimes.

While exact deployment numbers are not available, Sheriff's deputies are on patrol 24 hours a day, 7 days a week. The evening shift, which lasts until 2:00 a.m., has a larger deployment of uniformed and undercover officers than the morning shift (Metro 2009).

On October 27, 2002, the LACSD established the Office of Homeland Security to better protect county residents. This department works on a local level to protect citizens from terrorist attacks. The Transit Services Bureau falls within this department and oversees all security personnel and deputies that patrol the Metro transit system.

The Transit Services Bureau also tracks all criminal activities that occur on Metro buses, subways, and light-rail trains, and in all transit stations. This same department provides law enforcement across the entire 1,433-square-mile service area of the Metro system.

Table 4-1 lists Part I crime statistics occurring within the Transit Services Bureau jurisdiction from 2003 to 2006. Part I crimes can be defined as the most violent forms of crime, including criminal homicide, forcible rape, robbery, aggravated assault (involving deadly weapons), burglary, larceny theft, grand theft auto, and arson.

The LACSD reported that 1,231 Part I crimes occurred either on a Metro-operated LRVs, subways, or buses or within a station stop during 2006. Sheriff's deputies arrested approximately 5,300 adults and 400 juveniles within the transit system during 2006 (Metro 2009).

While there were 1,230 Part I crimes reported by the Transit Services Bureau for 2006, there were 4,504 Part II crimes, which include offenses like vandalism, non-aggravated assault, and

disorderly conduct. The most common incident was vandalism, with 1,906 reported incidents in 2006. Additionally, there were 2,188 non-criminal incidents reported by the Transit Services Bureau, including missing or found persons, transit accidents, and miscellaneous noncriminal activity.

Overall, of the 7,923 incidents reported by the Transit Services Bureau, Part I crimes made up 16 percent of the total incidents that were reported for Metro transit; Part II crimes made up 57 percent of the total incidents; and non-criminal incidents made up 27 percent of the total incidents reported.

4.2.1.2 City of Los Angeles - Central City

The LAPD provides police protection services in the City of Los Angeles, which is an area of approximately 483 square miles, with 21 communities representing approximately four million residents (LAPD 2007). In addition to administrative and special investigative units, the City of Los Angeles is divided into four smaller operational units or bureaus: the Central Bureau, the South Bureau, the West Bureau, and the Valley Bureau.

To facilitate response times, the LAPD has approximately 21 individual police stations located throughout the bureaus. The LAPD employs approximately 9,600 sworn and 2,900 civilian personnel, providing an average of approximately 2.4 sworn officers per 1,000 people (LAPD 2007). The LAPD Headquarters is located within 0.25 mile of the proposed project. The Central Bureau Station also services the area, with the Central Community Police Station located at 251 east 6th Street approximately 0.50 mile from the project.

4.2.1.3 City of Los Angeles - Central City North Community Plan Area

Police protection services are provided by the LAPD (refer to the Section 4.2.1.2 for detailed LAPD personnel and services information). One police station, the Chinatown Substation, serves the area and is located at 823 north Hill Street approximately 0.60 mile from the project.

4.2.1.4 Metro Transit Policing

By contract, the LACSD provides full police services for stations, rail vehicles, and property of Metro. These services include patrols of stations, platforms, and rail cars. Quality of life enforcement and fare evasion are two key responsibilities that LACSD Transit Services Bureau focuses on in the Metro system.

Metro security officers, under the direction of the LACSD Transit Services Bureau, have specific duties which primarily include guarding Metro facilities and closing Metro Rail stations late at night.

4.2.2 Fire Service Areas

The Metro Fire/Life Safety Committee meets regularly with area Los Angeles Fire Department and area ambulance service personnel to discuss past incidents and how to best coordinate

future responses. There are communications systems established between Metro Operations and adjoining fire agencies.

4.2.2.1 Los Angeles County

The Los Angeles County Fire Department (LACFD) provides fire and safety services to the unincorporated areas of Los Angeles County, to contracted cities, and to cities that are under an agreement for the cooperative response and management of fires and other emergency incidents, including the City of Los Angeles. The LACFD currently employs over 4,500 personnel, ranging from firefighters and paramedics to lifeguards and pilots. The LACFD operates 165 fire stations and several fire prevention offices (County of Los Angeles 2007). There are no LACFD fire stations within 0.25 mile of the proposed alternatives.

4.2.2.2 City of Los Angeles – Central City Community Plan Area

The LAFD provides fire suppression, emergency medical care, technical rescue, hazardous materials handling, disaster response, and community services to the City of Los Angeles. The LAFD has 3,594 uniformed personnel and 346 non-sworn support personnel located at 106 neighborhood fire stations and serving a 471-square-mile jurisdiction (LAFD 2008). There are 1,101 uniformed firefighters, including 226 firefighter/ paramedics, who are always on duty throughout the City.

The location and number of stations that would be called in the event of a fire or other emergency depend on a number of factors, including the type of emergency, the severity of the emergency, and the availability of the nearest fire station. In actuality, the resources of the entire LAFD force could be available collectively. There are three fire stations within the Central City Community Plan area, one of which is within 0.25 mile of the proposed alternatives.

4.2.2.3 City of Los Angeles - Central City North Community Plan Area

Fire services are provided by the LAFD (See Section 4.2.2.2 for detailed LAFD personnel and services information). Two fire stations, one of which is within 0.25 mile of the proposed project alignments, provide fire protection in the Central City North Community Plan area.

4.2.3 Homeland Security Concerns

Metro and LACSD coordinate regularly with the Department of Homeland Security (DHS) at several levels. They both work through the Regional Transit Security Working Group, are members of the local Joint Terrorist Task Force, and both coordinate with the area Federal Security Director for the Transportation Security Administration (TSA). Metro is currently in compliance with all TSA directives as well as 49 CFR1580, which requires designating a rail security coordinator and reporting significant security concerns to TSA.

The LACSD Transit Services Bureau represents Metro at FTA/TSA sponsored Security Round Table meetings where transit security chiefs discuss best practices and lessons learned, and coordinate with TSA and FTA leaders from those agencies' headquarters. Metro also follows

the FTA's "Transit Agency Security and Emergency Management Protective Measures," which were developed in consultation with TSA.

As is the case with the safety and security concerns described in section 4.1, Homeland Security should be assessed and considered during construction activities for the LRT infrastructure. Coordination with police and fire service providers must be made prior to and during construction to understand the daily construction schedules, and how emergency services will serve the area during periods of construction. Evacuation plans should be in place for those areas that are temporarily affected by constructions activities, such as the overnight closure of a roadway and/or other temporary detours that may affect evacuation plans. Additionally, public events such as "May Day Parades" or civic protests must be taken into consideration when construction activities occur to ensure safety of workers, participants, Metro patrons, and other members of the public.

5.0 IMPACTS

5.1 No Build Alternative

The No Build Alternative (Figure 5-1) is focused on preserving existing services and projects. Transit service under the No Build Alternative does not include any major service improvements or new transportation infrastructure beyond what is listed in Metro's 2009 Long Range Transportation Plan (LRTP).

By the projection year of 2035, the Metro Expo Line and the Metro Gold Line to the San Gabriel Valley will have opened, and a number of bus services will have been reorganized and expanded to provide connections with these new rail lines. The transit network within the project area would otherwise be largely the same as it is now.

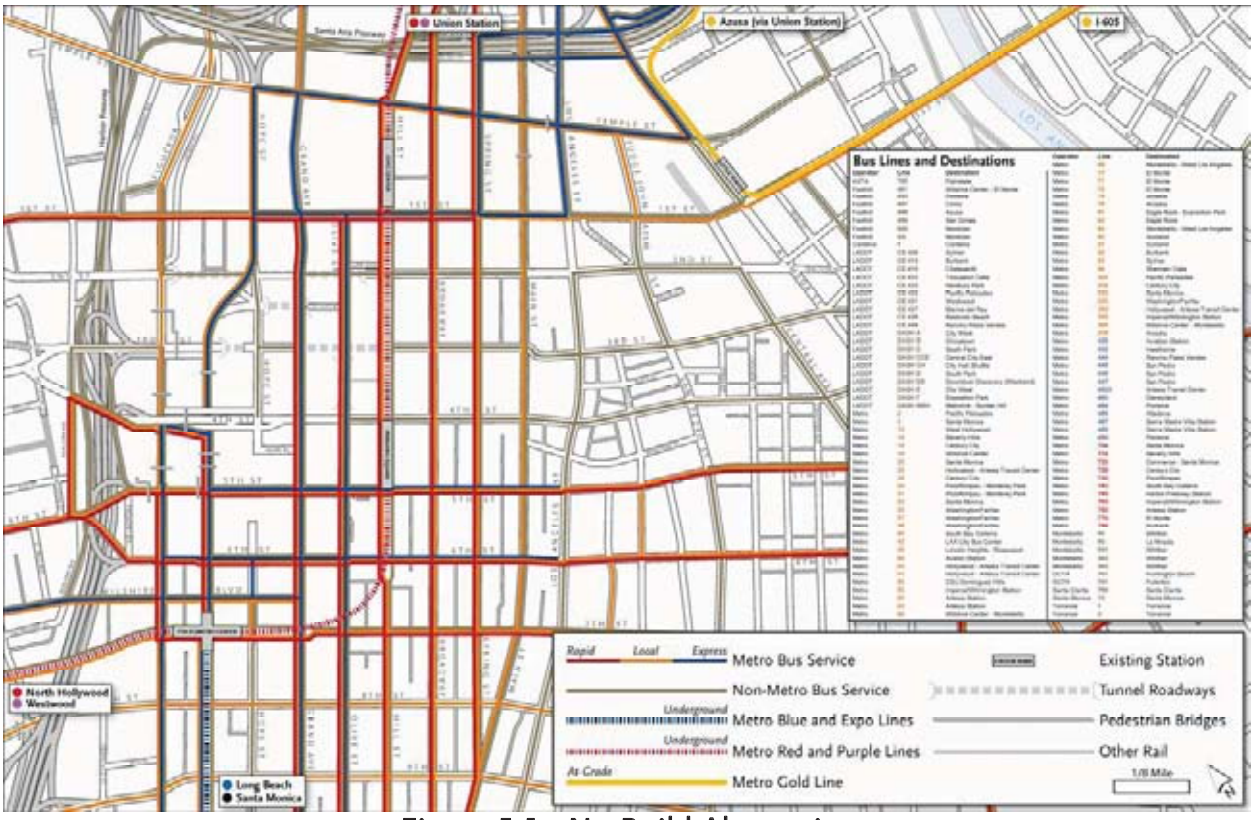

Figure 5-1. No Build Alternative

5.1.1 Direct Impacts - Construction and Operation

The No Build Alternative would maintain the current level of transit service in the project corridor and, therefore, would not have an immediate impact on public safety or accidents.

There are no direct construction-related impacts from the No Build Alternative.

5.1.2 Indirect Impacts – Construction and Operation

The No Build Alternative would maintain the current level of transit service in the project corridor and, therefore, would not have an indirect or future impact on public safety or accidents.

There are no indirect construction-related impacts from the No Build Alternative.

5.1.3 Cumulative Impacts – Construction and Operations

The No Build Alternative would maintain the current level of transit service in the project corridor and, therefore, would not have a cumulative impact on public safety or accidents.

There are no cumulative construction-related impacts from the No Build Alternative.

5.2 Transportation System Management (TSM) Alternative

The Transportation System Management (TSM) Alternative (Figure 5-2) includes all of the provisions of the No-Build Alternative, plus two new express shuttle bus lines linking the 7th Street/Metro Center Station and Union Station. These buses would run frequently, perhaps just a few minutes apart, especially during peak hours.

The buses may also have traffic signal priority similar to the Metro Rapid system, where the traffic signal control system grants longer green lights to oncoming transit vehicles. Enhanced bus stops would be located every two to three blocks to maximize coverage of the area surrounding the proposed routes.

5.2.1 Direct Impacts – Construction and Operation

The TSM Alternative would maintain the current level of transit service in the project corridor and also increase cross-station opportunities by adding two new express shuttle buses. The TSM Alternative would not have a detrimental and/or increased impact on public safety or accidents. Buses would operate on existing streets, so there would be no changes to the existing environment.

There are no direct construction-related impacts from the TSM Alternative related to safety and security.

5.2.2 Indirect Impacts – Construction and Operation

The TSM Alternative would not have a detrimental and/or increased impact on public safety or accidents. A potential indirect impact would be the "induced demand" created by better and more frequent service for the overall LRT system by providing the express shuttle buses. This induced demand can be viewed as both positive and negative: positive in that this type of transportation improvement may result in appropriate transit-oriented land use changes, and negative in that more people could be brought into a defined geographic area, possibly resulting in potential new conflicts between transit and pedestrians and motorists.

There are no indirect construction-related impacts from the TSM Alternative to safety or security.

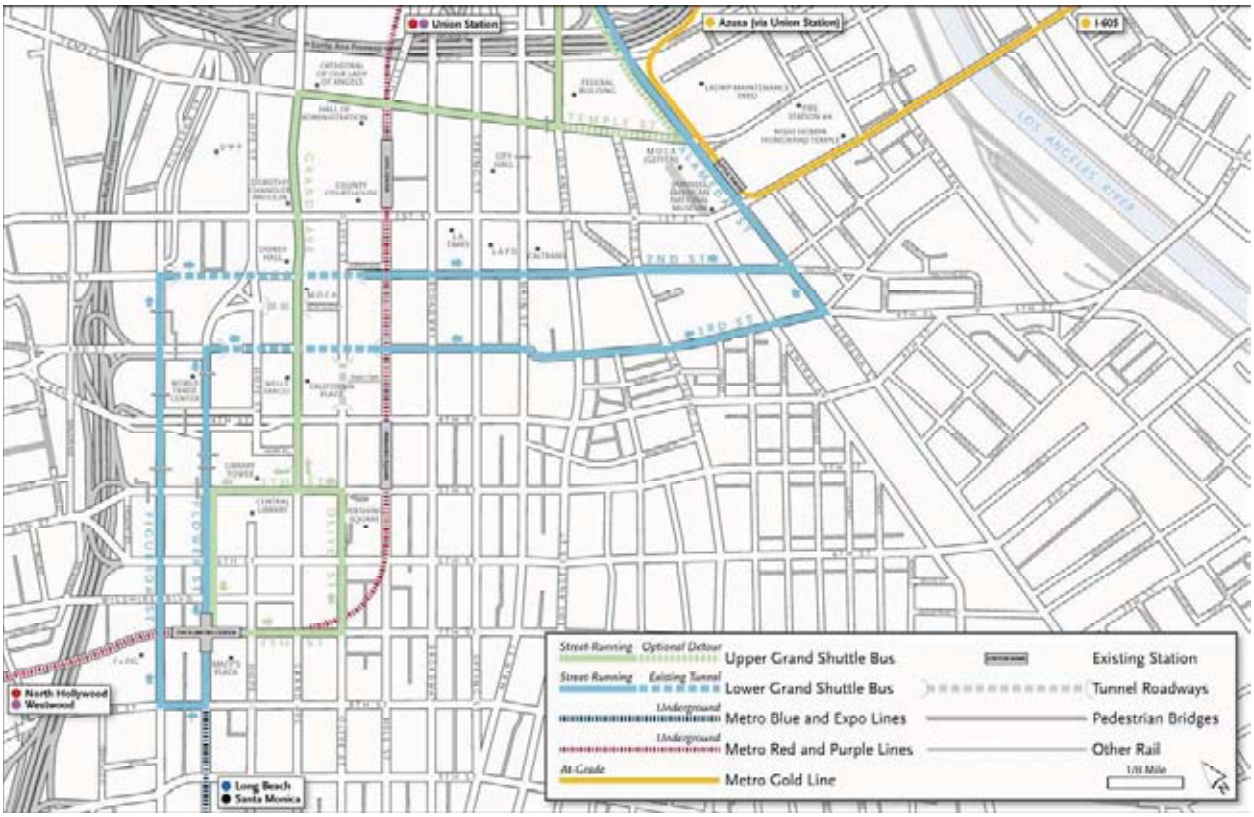

Figure 5-2. Transportation System Management (TSM) Alternative

5.2.3 Cumulative Impacts – Construction and Operation

When considered in combination with other reasonably foreseeable projects in the project area, the TSM Alternative would not have either a construction-related or operational cumulative effect because there would be no direct or indirect effects. .

5.3 At-Grade Emphasis LRT Alternative

The At-Grade Emphasis LRT Alternative (Figure 5-3) extends from the underground 7th Street/Metro Center Station, heads north under Flower Street, resurfaces to at-grade north of 4th Street, crosses 3rd Street at-grade, enters Bunker Hill, and turns northeast through a new entrance to the existing 2nd Street tunnel. The alignment continues along 2nd Street and splits into an at-grade couplet configuration traveling north on Main and Los Angeles Streets (one track on each roadway). It then heads east on Temple Street, realigns into a dual-track configuration just east of Los Angeles Street, and connects to the Metro Gold Line in a three-way junction north of the Little Tokyo/Arts District Station on Alameda Street. An automobile underpass and proposed pedestrian overpass would be constructed at the intersection of

Temple and Alameda Streets due to the high volume of trains that would traverse the Regional Connector. This would eliminate potential pedestrian/train and automobile/train conflicts.

This alignment includes both underground and at-grade configurations (46 percent of the route is underground) and serves the Financial District, Grand Avenue, and the Civic Center. Conversion of 2nd Street to a pedestrian-friendly transit mall is assumed. To implement this alternative, the number of traffic lanes and on-street parking on 2nd Street would be reduced. As a result, traffic would likely divert to adjacent parallel streets such as 1st Street and 3rd Street, but the roadway capacity along these streets would remain unchanged, as with the No Build Alternative.

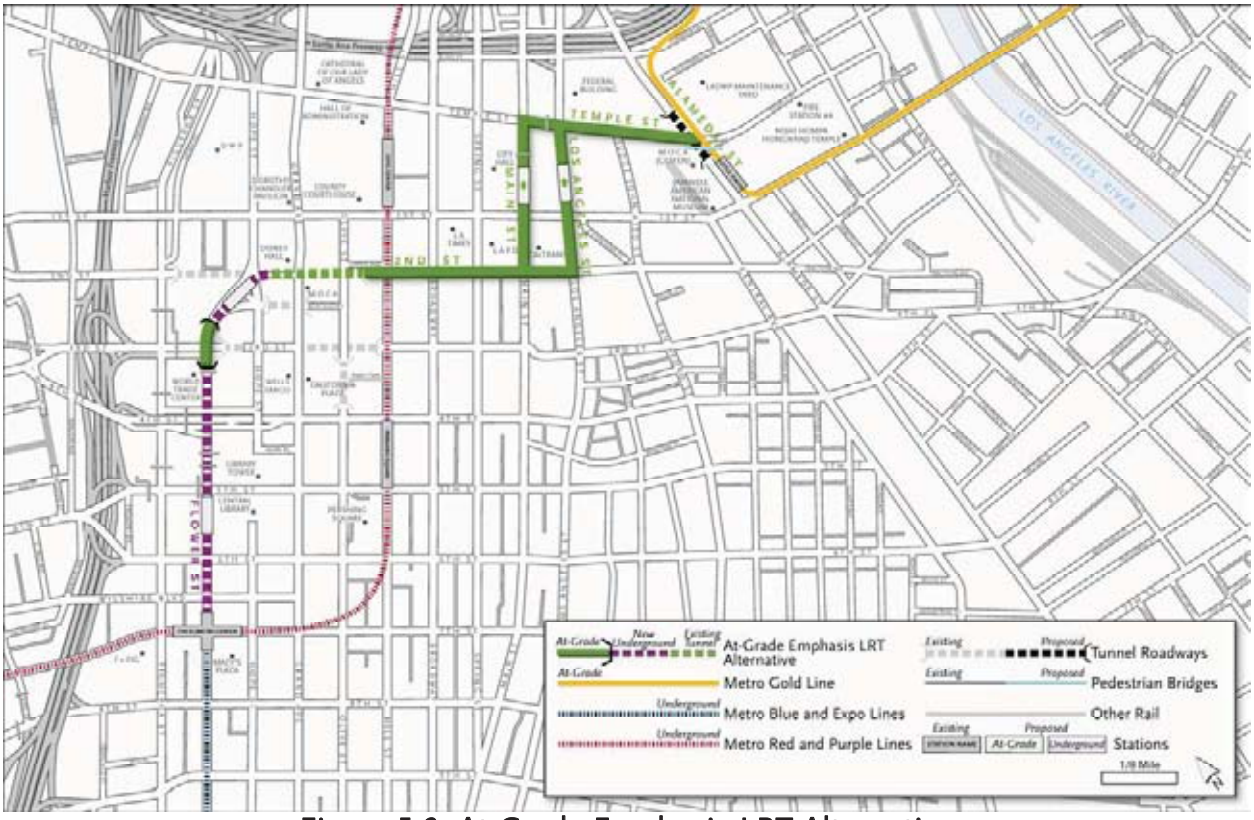

Figure 5-3. At-Grade Emphasis LRT Alternative

5.3.1 Direct Impacts – Construction and Operation

The At-Grade Emphasis LRT Alternative could affect the pedestrian environment, motorist safety, and emergency response times for emergency service providers during both construction and LRT operation. Identified concerns from Section 4 have been reviewed within the context of this alternative, and key potential issues related to pedestrian and motorist safety have been identified. Table 5-1 lists these potential effects. CEQA guidelines

on safety and security regarding pedestrian safety, station accidents and collisions, police and fire response, and criminal activity are addressed in the following sections.

5.3.1.1 Pedestrian Safety and Station Accidents

The pedestrian safety assessment along the proposed LRT corridor focused on three separate categories, including:

- Pedestrian safety at station locations
- Pedestrian safety near the trackway
- Pedestrian safety at designated grade crossings

These safety considerations would apply primarily to proposed at-grade stations. These concerns either do not arise with underground LRT facilities (there are no corridor crossings for pedestrians or vehicles) or the stations can be designed to avoid these concerns (e.g., a design that avoids the need for pedestrians to cross tracks and the potential for collisions with light rail vehicles). The At-Grade Emphasis LRT Alternative includes both underground and at-grade stations, so these safety considerations would apply to the evaluation of this alternative.

Passenger Safety at Proposed Station Locations

The presence of at-grade stations may introduce a new safety hazard for pedestrians if the stations do not adequately account for pedestrian traffic and movement. This hazard would be present irrespective of the headways of the LRVs. The occurrence of this hazard may be attributed to the inherent purpose of a station, where large numbers of people congregate and cross the trackway to access or depart from the transit stations, thus creating a potential hazard of collision between pedestrians and LRVs.

Anticipated passenger loads and pedestrian counts would be used to determine the most appropriate pedestrian treatments to control and channel pedestrian/passenger movements during design. Additionally, stations would be appropriately sized to accommodate the anticipated number of passengers. These design solutions would reduce this potential impact to a less than significant level.

Pedestrian Safety near the Trackway

Adding light rail vehicles would be the primary new safety hazard for pedestrian traffic along the proposed alignment. The speed of the vehicles would be similar to or slower than adjacent automobile traffic. The LRV would be electrically powered and, therefore, quieter than most automobile traffic and may not be easily heard. This hazard includes crossings at intersections where pedestrians cross over the light rail tracks, and human intrusion on the ROW (jaywalking).

Channelization techniques would be used to direct pedestrians to designated pedestrian crossings and minimize inappropriate crossing behaviors. LRVs are equipped with audible warning bells and horns, which would be used as appropriate to alert pedestrians to the approach of a train. This safety consideration is only relevant to the at-grade portions of the alignment because there would be no opportunity for pedestrians to cross tracks that run in an underground tunnel. The design solutions and operating guidelines would reduce this potential impact to a less than significant level.

Pedestrian Safety at Designated Grade Crossings

Pedestrian safety at designated grade crossings is a key factor to be considered in the design of LRT systems. This safety consideration is relevant only to the at-grade portions of the alignment because there would be no opportunity for pedestrians to cross tracks that run in an underground tunnel.

Multiple designated pedestrian grade crossings would be created by the proposed At-Grade Emphasis LRT Alternative. A vast majority of these pedestrian crossings would be located at motorist crossings of the tracks.

A potential safety hazard could occur if the distance between designated crossings tempts pedestrians to cross the tracks at locations other than designated pedestrian crossings. In addition, potential riders who see a train approaching may attempt to cross streets and tracks illegally in order to avoid missing a train in much the same way as these violations currently occur at bus stops. Furthermore, departing passengers may be tempted to take shortcuts from station areas to access nearby destinations instead of crossing at designated crossings.

Pedestrian traffic control and channelization techniques would be used to control pedestrian movements at intersections and encourage the use of designated pedestrian crossings. In addition, Metro would prepare grade crossing applications in coordination with the CPUC and local public agencies, such as LADOT, Bureau of Engineering, and the City and County Fire departments. Based on review of grade crossing applications, additional safety and security design features may be incorporated if necessary. Applications would be available for review by the public prior to approval. These design solutions and grade crossing application process would reduce this potential impact to a less than significant level.

5.3.1.2 Motorist Safety and Collisions

In the downtown area, LRVs would operate within the existing streets at street level for approximately half of the At-Grade Emphasis LRT Alternative alignment length. LRVs would be required to observe all traffic laws just as a car or bus would, including stopping for red lights. LRVs would also be required to yield to emergency vehicles at intersections.

It would be possible for automobiles to stray into the rail right-of-way at some locations because LRVs would share the same right-of-way with automobiles, and accidents between the LRT vehicle and motor vehicles would be possible. However, studies have shown that light rail vehicle accidents with motor vehicles at non-intersection locations are extremely rare.

Studies that have demonstrated this include Korve Engineering, Inc, *Transit Cooperative Research Program (TCRP) Report 17 – Integration of Light Rail Transit into City Streets (1996)*; PB Americas, Inc. and Science Applications International Corporation (SAIC), *Transit Cooperative Research Program (TCRP) Report 79 – Light Rail Vehicle Collisions with Vehicles at Signalized Intersections (2009)*; and Texas Transportation Institute, *METRO Rail Traffic Safety Assessment (2004)*.

The single-most frequent cause for motor vehicle/light rail accidents at intersections is when motorists turn left in front of a light rail vehicle (with the LRV traveling in the same direction). To reduce this risk, it is assumed that a left turn from 2nd Street or from the side streets to 2nd Street would not be permitted when LRVs are approaching the intersection from either direction.

Other accidents between LRVs and motorists stem from motorists disobeying red light signals. The LRV operators would have audible warning devices available to alert unwary drivers to the risk of accidents. Additionally, active "Train Approaching" signs may be used to further alert drivers of the approach of a train.

Although all such accidents may not be totally prevented, studies have found active "Train Approaching" signs to greatly reduce the likelihood of a collision. Traffic signal phasing (all-red phase and lagging left turns) has also proven to be effective in reducing LRV and motor vehicle collisions. Furthermore, the low operating speeds of both LRVs and motor vehicles reduce the possibility of serious injury or damage. As previously discussed, Metro would prepare grade crossing applications in coordination with the CPUC and local public agencies, such as LADOT, Bureau of Engineering, and the City and County Fire departments. All of these design and operating characteristics and the grade crossing application process would reduce this potential safety concern to a less than significant level.

5.3.1.3 Security

Security issues may be related to police and fire response, emergency evacuation, and addressing criminal and terrorist activity. To mitigate potential safety and security concerns, a complete Threat and Vulnerability Assessment in compliance with FTA regulations would be conducted for the locally preferred alternative when one is selected.

Police and Fire Response

Standard specifications and traffic work plans would be developed to reduce potential construction impacts on emergency service provider emergency response times. The project would include coordination with police and fire services to develop construction and operation plans and provide appropriate public safety and security for the Metro system, employees, and surrounding communities. The LACSD policing contract with Metro would be extended to include the Regional Connector project, and the project would be coordinated and compliant with TSA/DHS. Potential impacts would be reduced to a less than significant level through these measures.

LAFD Station #3 is located at the corner of 1st Street and Fremont Avenue, about 0.25 miles away from an underground portion of the At-Grade Emphasis LRT Alternative alignment. This portion of the alignment is not expected to affect fire response times because it is underground. LAFD Station #4 is located at Temple and Garey Streets, less than 0.25 mile away from the proposed underpass and three-way rail junction at Temple and Alameda Streets. Further coordination with LAFD will be conducted to determine whether construction and operation of the new underpass and frontage roads would restrict fire truck turning movements, and whether any needed detours would lengthen response times.

Fire safety in particular is addressed through design considerations. Metro's *Fire/Life Safety Design Criteria* outline specific requirements for fire protection at stations, along the alignment, and within LRVs. Requirements include providing fire alarm control systems at each enclosed station facility and a public address system at each station.

All LRVs would be equipped with fire extinguishers, and fans to ventilate the LRV in case of fire. The LRVs would also experience reduced hazards from fire by specifying materials with minimum burning rates, smoke generation, and toxicity characteristics.

Additional design criteria address emergency responder access, passenger egress standards, standards for sprinkler systems, and standpipe connections for fire response. Adherence to these standards and federal, state, and local regulations, in conjunction with the low risk of fires at stations, would result in less than significant potential impacts to safety and security.

Crime and Terrorist Activity

Depending on the type of construction, and also the construction sequencing, temporary barricades and fencing would be used to prevent unauthorized personnel from entering construction areas, especially after hours and/or when construction is dormant. This is especially important when construction activities expose underground utilities and/or when excavated trenches have been created and left in an open state.

There is the potential for security issues associated with the proposed project to occur such as assault or robbery. These concerns would be addressed both through design considerations and by providing law enforcement personnel on the transit system during hours of operation.

Every station would be well lit to provide visibility around the entire station day and night, as specified by City requirements and Metro *Design Criteria*. The stations and the LRVs would be equipped with closed circuit TV systems and monitored by Metro personnel. Additionally, emergency call boxes would be available in all stations for passenger use in case of emergency, and each LRV would have an operator that could be contacted by passengers via an intercom system.

An at-grade system is vulnerable to both public demonstrations and vehicle-borne or other improvised explosive devices. Public demonstrations and large-scale disturbances can negatively impact an LRT system built at grade level, potentially disrupting service and leaving

stations and equipment vulnerable to damage. Terrorist groups have been increasing their use of vehicle-borne improvised explosive devices, which can damage equipment and injure or kill passengers.

The underground portions of the alignment are less vulnerable to these types of security concerns; however, in recent years terrorist groups have struck at underground rail systems in some of the major capitols of the world, such as London and Tokyo. In addition, underground systems have a greater potential for safety issues related to evacuation needs. A complete Threat and Vulnerability Assessment in compliance with FTA regulations would be conducted for the locally preferred alternative when one is selected. For the At-Grade Emphasis LRT Alternative this would include a complete evacuation plan that would mitigate any potential safety concerns.

5.3.2 Indirect Impacts – Construction and Operation

Given project design features, the grade crossing application process, and the Threat and Vulnerability Assessment, potential indirect impacts associated with the At-Grade Emphasis LRT Alternative would not have a detrimental and/or increased impact on public safety or accidents during both construction and LRT operation. A potential indirect impact would be increased ridership created by increased public transportation service for the overall LRT system through the system-wide connections provided by the Regional Connector project. This increased demand could have both beneficial and adverse effects. Transit-oriented developments could create more pedestrian appropriate and safe environments and/or cause an increase in the number of people in a defined geographic area, potentially resulting in new conflicts between pedestrians and motorists.

Table 5-1. Safety Analysis for the At-Grade Emphasis LRT Alternative			
Evaluation Factor (per Section 3.0)	**6th Street**	**5th Street**	**4th Street**
Traffic Queuing	No impact to vehicular traffic; LRT is underground at this location	No impact to vehicular traffic; LRT is underground at this location	No impact to vehicular traffic; LRT is underground at this location
Motorist Approach Sight Distance (North Leg[1])	OK	OK	Proximity of overpass piers to curbside may cause sight distance concerns for motorists
Motorist Approach Sight Distance (South Leg[1])	OK	OK	OK
Motorist Approach Sight Distance (West Leg[1])	OK	OK	Proximity of overpass piers to curbside may cause sight distance concerns for motorists
Motorist Approach Sight Distance (East Leg[1])	OK	OK	Compromised – access to parking garage
Pedestrian Sight Distance	OK	OK	Somewhat compromised due to overpass shading & overpass structural support (abutments and piers)
Crash History	Not evaluated due to LRT being underground at this location	Not evaluated due to LRT being underground at this location	Not evaluated due to LRT being underground at this location

Table 5-1. Safety Analysis for the At-Grade Emphasis LRT Alternative

Evaluation Factor (per Section 3.0)	6th Street	5th Street	4th Street
Crossing Delineation/Signage	Pedestrian crossings allowed on all four legs; marked with color stamped concrete & white markings	Pedestrian overpass provided on west leg of intersection; Also two pedestrian overpasses present just north of intersection on Flower Street; Pedestrian crossings allowed on all four legs; marked with color stamped concrete & white markings	Pedestrian overpass provided on west leg of intersection; Pedestrian crossings allowed on all four legs; marked with color stamped concrete & white markings on three legs & east leg just marked with white lines
Traffic Control Compliance Issues	West leg (6th Street) is an off-ramp from SR 110. Field observations noted speeds higher than predicted because of this	West leg (5th Street) is an on-ramp to SR 110. Field observations noted speeds higher than predicted because of this	Vehicles exiting parking garage access (east leg) must encroach into crosswalk to see oncoming traffic on Flower Street
Special Generators	City National Plaza (office complex)	Bonaventure Hotel Complex CitiCorp Plaza	World Trade Center
Presence of Adequate Lighting	OK – standard luminaires located on three quadrants of intersection & decorative luminary on remaining quadrant	OK – standard luminaires located on all four quadrants of intersection	Dark location due to shading of bridge overpass; standard luminaires located on all four quadrants of intersection

Table 5-1. Safety Analysis for the At-Grade Emphasis LRT Alternative (cont.)

Evaluation Factor (per Section 3.0)	3rd Street	Kosciuszko Street	Hope Street	S. Grand Avenue	S. Olive Street
Traffic Queuing	Pre-signal would be provided At-grade intersection with LRT	No impact to vehicular traffic; LRT is underground at this location	No impact to vehicular traffic; LRT is underground at this location	No impact to vehicular traffic; LRT is underground at this location	No impact to vehicular traffic; LRT is underground at this location
Motorist Approach Sight Distance (North Leg[1])	OK	OK	OK	OK	OK
Motorist Approach Sight Distance (South Leg[1])	OK	OK	OK	OK	OK
Motorist Approach Sight Distance (West Leg[1])	OK	OK	OK	Eastbound vehicle sight distance slightly limited due to grade of east leg (2nd Street)	OK
Motorist Approach Sight Distance (East Leg[1])	OK	OK	OK	Westbound vehicle sight distance slightly limited due to grade of east leg (2nd Street)	Westbound vehicle sight distance slightly limited due to grade of east leg (2nd Street); one-way leg in westbound direction only (2nd Street)
Pedestrian Sight Distance	OK	Slightly compromised due to vegetation on southwest corner of intersection	Slightly compromised due to vegetation on southwest corner of intersection	Intersection is elevated and on top of crest; excellent sight distance for pedestrians on all legs of intersection	OK
Crash History	Not evaluated	Not evaluated due to LRT being underground at this location	Not evaluated due to LRT being underground at this location	Not evaluated due to LRT being underground at this location	Not evaluated due to LRT being underground at this location
Crossing Delineation/Signage	Pedestrian overpass provided on south leg of intersection near World Trade Center; Pedestrian crossings allowed on all four legs; marked with color stamped concrete & white markings on three legs & east leg just marked with white lines	No pedestrian crossings allowed on north leg and west leg of intersection – prohibited by signage and lack of marked crosswalk	No pedestrian crossings allowed on north leg and west leg of intersection – prohibited by signage and lack of marked crosswalk	All crosswalks are well marked and signing is appropriate; fairly new intersection construction	No pedestrian crossing allowed on north leg of intersection – prohibited by signage and lack of marked crosswalk
Traffic Control Compliance Issues	None observed	None observed; triple left turns off of north leg of Kosciuszko	None observed; triple left turns off of north leg of Kosciuszko	None observed; designated left turn arrows present for heavy left-turn movements	None observed; designated left turn arrows present for heavy left-turn movements from 2nd Street to S. Olive Street
Special Generators	World Trade Center	Walt Disney Concert Hall	Walt Disney Concert Hall	Walt Disney Concert Hall	None noted

Presence of Adequate Lighting	OK – standard luminaires located on all four quadrants of intersection	OK – standard luminaires located on all four quadrants of intersection	OK – standard luminaires located on all four quadrants of intersection	OK – standard luminaires located on all four quadrants of intersection	OK – standard luminaires located on all three quadrants of intersection

[1] *A leg of an intersection is the street segment that forms one part of the intersection. For example, the north leg would be the street that forms the northern portion of an intersection.*

5.3.3 Cumulative Impacts – Construction and Operation

Potential cumulative impacts of the At-Grade Emphasis LRT Alternative are qualitatively assessed in parallel to other known projects out to the baseline year (year 2035). Within the area of influence of this proposed alternative, there are a variety of major renovations to existing buildings, new facility construction, transportation projects, and mixed use developments under consideration. However, each of these projects would address safety and security of pedestrians and motorists accessing the developments. From a cumulative perspective, potential impacts associated with the At-Grade Emphasis LRT Alternative would be mitigated to a less than significant level and not have a cumulative effect on the safety and security environment in the project area during both construction and LRT operation.

5.4 Underground Emphasis LRT Alternative

The Underground Emphasis LRT Alternative (Figure 5-4) would connect directly to the Metro 7th Street/Metro Center Station, continue north underneath Flower Street to 3rd Street, and then proceed northeast to 2nd and Hope Streets. Tracks would be constructed east underneath the 2nd Street tunnel and 2nd Street to Central Avenue. The tracks would then veer north into a new portal on the private property bounded by 1st Street, Alameda Street, 2nd Street, and Central Avenue. It is expected that a portion of this block would need to be acquired in order to construct the portal and stage construction of the tunnels beneath 2nd Street. The tracks would then enter the intersection of 1st and Alameda Streets in the same type of three-way junction planned for the At-Grade Emphasis LRT Alternative, with a potential pedestrian overpass and vehicular underpass for through traffic on Alameda Street.

5.4.1 Direct Impacts – Construction and Operation

The Underground Emphasis LRT Alternative could affect the pedestrian environment, motorist safety, and emergency response times for emergency service providers during both construction and LRT operation. Identified concerns from Section 4 have been reviewed within the context of this alternative, and key potential issues related to pedestrian and motorist safety have been identified.

Table 5-2 lists these potential effects. CEQA guidelines on safety and security regarding pedestrian safety, station accidents and collisions, police and fire response, and criminal activity are addressed in the following sections.

5.4.1.1 Pedestrian and Motorist Safety, Station Accidents, and Collisions

The pedestrian safety assessment along the proposed LRT corridor focused on three separate categories, including:

- Pedestrian safety at station locations
- Pedestrian safety near the trackway
- Pedestrian safety at designated grade crossings

These safety considerations would apply primarily to proposed at-grade segments. These concerns do not arise with underground LRT facilities (there are no trackway crossings for pedestrians or vehicles) and, where applicable, stations could be designed to avoid these concerns (e.g., a design that avoids the need for pedestrians to cross tracks and the potential for collisions with light rail vehicles). Underground stations would be designed to avoid this potential safety hazard by designing stations to prevent or avoid the need for pedestrians to cross trackways as they enter or depart the station.

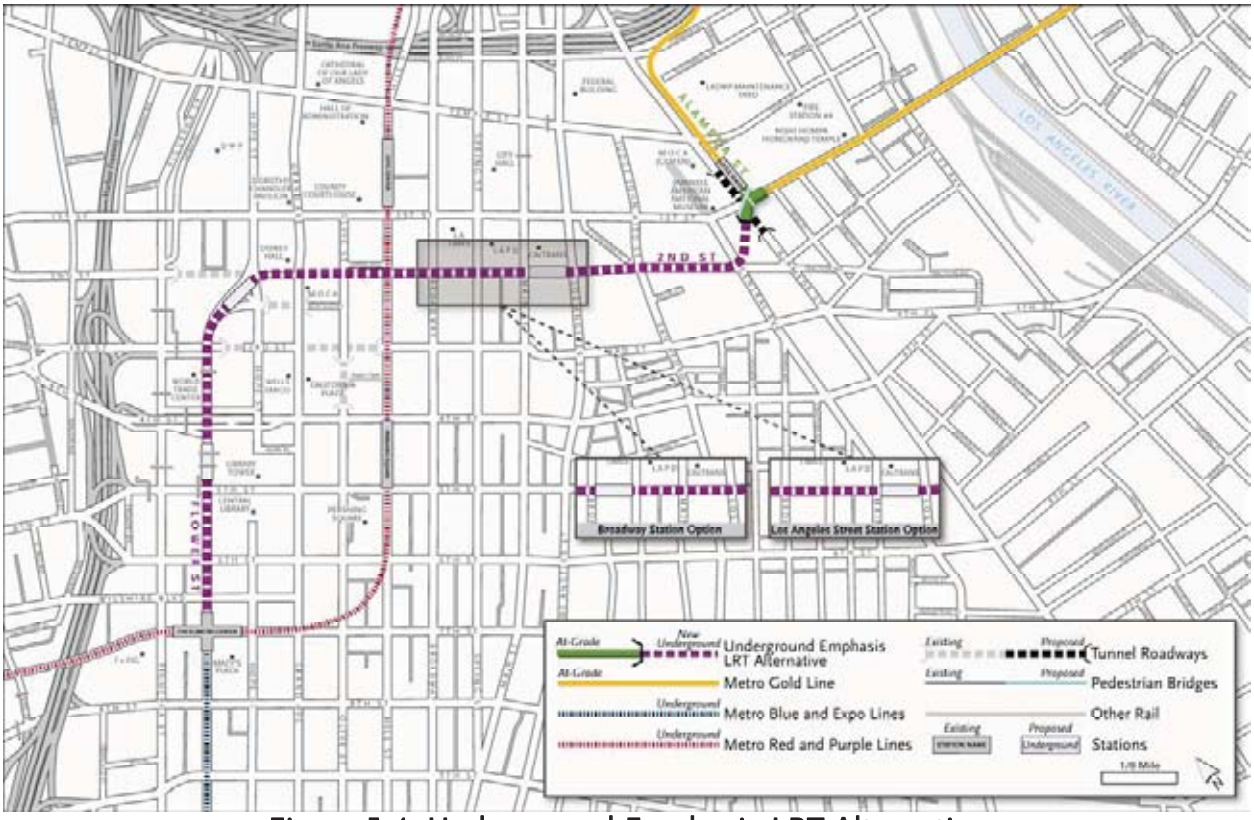

Figure 5-4. Underground Emphasis LRT Alternative

The only at-grade crossing proposed for the Underground Emphasis LRT Alternative is located at 1st and Alameda Streets. At this location, most vehicles and pedestrians would be grade-separated from the LRT tracks. A proposed pedestrian bridge structure over the intersection would allow pedestrians to cross the intersection without crossing paths with auto traffic or trains. For motor vehicles and LRVs operating at-grade at this intersection, Metro would prepare grade crossing applications in coordination with the CPUC and local public agencies, such as LADOT, Bureau of Engineering, and the City and County Fire departments. Based on review of grade crossing applications, additional safety and security design features may be incorporated if necessary. Applications would be available for review by the public prior to approval. The grade crossing application process would reduce potential safety concerns between motor vehicles and LRVs to a less than significant level.

A new underpass would allow traffic on Alameda Street to travel below 1st Street and the LRT tracks. Only auto traffic on 1st Street would cross the new LRT tracks at-grade. This proposed design would avoid potential safety effects at pedestrian and motorist crossings. The grade-separated nature of the Underground Emphasis LRT Alternative would avoid these potential effects and result in no impact.

5.4.1.2 Security

Security issues may be related to police and fire response, emergency evacuation and responses, and addressing criminal and terrorist activity. A complete Threat and Vulnerability Assessment in compliance with FTA regulations would be conducted for the locally preferred alternative when one is selected to mitigate potential safety and security concerns.

Police and Fire Response

Standard specifications and traffic work plans would be developed to reduce potential construction impacts on emergency service providers by reducing potential impacts on emergency response times. The project would include coordination with police and fire services to develop construction and operation plans that support appropriate safety and security of the public using the Metro system, employees, and the surrounding communities. The LACSD policing contract with Metro would be extended to include the Regional Connector project, and the project would be coordinated and compliant with TSA/DHS. Potential impacts would be reduced to a less than significant level through these measures.

LAFD Station #3 is located at the corner of 1st Street and Fremont Avenue, about 0.25 mile away from an underground portion of the Underground Emphasis LRT Alternative alignment. This portion of the alignment is not expected to affect fire response times because it would be underground.

LAFD Station #4 is located at Temple and Garey Streets, less that 0.25 mile away from the proposed underpass and three-way rail junction at 1st and Alameda Streets. The new underpass would likely improve response times for emergency vehicles travelling south on Alameda Street because they would no longer encounter cross traffic at 1st Street. Further coordination with LAFD will be conducted to determine whether construction or operation of the new underpass and frontage roads would affect response times.

Fire safety in particular is addressed through design considerations. Metro's *Fire/Life Safety Design Criteria* outline specific requirements for fire protection at stations, along the alignment, and within LRVs. Some of the identified requirements include fire alarm control systems at each enclosed station facility and a public address system at each station. All LRVs would be equipped with fire extinguishers, and fans to ventilate the LRV in case of fire.

Hazards to LRVs from fire would be reduced by specifying LRV materials with minimum burning rates, smoke generation, and toxicity characteristics. Additional design criteria address emergency responder access, passenger egress standards, and standards for sprinkler systems and standpipe connections for fire response. Adherence to these standards

and federal, state, and local regulations, and the low risk of fires at stations would result in a less than significant potential impact to safety and security.

Crime and Terrorist Activity

Depending on the type of construction, and also the construction sequencing, temporary barricades and fencing would be used to prevent unauthorized personnel from entering construction areas, especially after hours and/or when construction is dormant. This is especially important when construction activities expose underground utilities and/or when excavated trenches have been created and left in an open state.

There is the potential for security issues to occur such as assault or robbery on the proposed project. These concerns would be addressed by applying design considerations and providing law enforcement personnel on the transit system during hours of operation. Every station would be well lit to provide visibility around the entire station day and night, as specified by City requirements and Metro *Design Criteria*.

The stations and the LRVs would be equipped with closed circuit TV systems monitored by Metro personnel. Additionally, emergency call boxes would be available in all stations for passenger use in case of emergency, and each LRV would have an operator that could be contacted by passengers via an intercom system.

The Underground Emphasis LRT Alternative presents a different set of conditions than the At-grade Emphasis LRT Alternative because there are more underground stations and longer underground tunnels. Some of these altered conditions might include:

- Activity in underground stations and tunnels would be out of the general public view, and less observable by routine neighborhood security/police patrols in the general area, as compared to street level facilities.
- Tunnels may offer non-domiciled persons refuge from the elements.
- Staircases and passageways may create opportunities for criminal activity.
- Tunnels offer a greater consequence to train service should trespassers enter; clearance and concealment issues may arise.
- Limited access to stations and the LRT system results in greater control and ability to monitor activities in an underground system.
- Underground system operation may be more reliable.

The Underground Emphasis LRT Alternative would be less vulnerable to disruptions from public demonstrations and to impacts from vehicle-borne improvised explosive devices. By controlling entries, an underground system may continue to function during public demonstrations and large-scale disturbances at grade level. However, terrorist groups have

recently struck at underground rail systems in some of the major capitols of the world, including London and Tokyo.

In addition, underground systems have a greater potential for safety issues related to evacuation needs. A complete Threat and Vulnerability Assessment in compliance with FTA regulations would be conducted for the locally preferred alternative when one is selected. For the Underground Emphasis LRT Alternative, this would include a complete evacuation plan to mitigate any potential safety concerns.

5.4.2 Indirect Impacts – Construction and Operation

Potential indirect impacts associated with the Underground Emphasis LRT Alternative would not have a detrimental or increased effect on public safety or accidents during both construction and LRT operation. A potential indirect impact could be the increased ridership created by increased public transportation service for the overall LRT system through the system-wide connections provided by the Regional Connector project.

Increased demand could have both beneficial and adverse effects. Transit-oriented developments could create more pedestrian appropriate and safe environments and/or cause an increase in the number of people in a defined geographic area, potentially resulting in new conflicts between pedestrians and motorists.

5.4.3 Cumulative Impacts – Construction and Operation

Potential cumulative impacts of the Underground Emphasis LRT Alternative are qualitatively assessed in parallel to other known projects out to the baseline year (year 2035). Within the area of influence of this proposed alternative, there are a variety of major renovations to existing buildings, new facility construction, transportation projects, and mixed-use developments under consideration. Each of these projects would address safety and security of pedestrians and motorists accessing the developments. From a cumulative perspective, potential impacts associated with the Underground Emphasis LRT Alternative would be mitigated to a less than significant level and they would not have a cumulative effect on the safety and security environment in the project area during both construction and LRT operation.

[1] *A leg of an intersection is the street segment that forms one part of the intersection. For example, the north leg would be the street that forms the northern portion of an intersection.*

5.5 Fully Underground LRT Alternative – Little Tokyo Variation 1

The Fully Underground LRT Alternative - Little Tokyo Variation 1 (Figure 5-5) would provide four new stations and a direct connection from 7th Street/Metro Center Station to the existing Metro Gold Line tracks north and east of 1st and Alameda Streets. The alignment would extend underground from the 7th Street/Metro Center Station under Flower Street to 2nd Street. The tracks would then proceed east underneath the 2nd Street tunnel and 2nd Street to Central Avenue.

At 2nd Street and Central the tracks continue underground, heading northeast under 1st and Alameda Streets. A three-way (wye) junction would be constructed underground beneath the 1st and Alameda intersection. To the north and east of the junction, trains would rise to the surface through two new portals to connect to the Metro Gold Line heading north to Azusa and east to I-605.

One portal would be located northeast of the existing Little Tokyo/Arts District Station and tracks. This portal would rise to the north within the Los Angeles Department of Water and Power (LADWP) Maintenance Yard and connect to the existing LRT bridge over US-101, allowing a connection to the Metro Gold Line to Azusa. The portal would be connected to the 1st and Alameda junction by a new tunnel crossing beneath Temple Street and the property proposed for the Nikkei Center (on the northeast corner of 1st and Alameda Streets) and running immediately east of the existing Little Tokyo/Arts District station and tracks.

The second portal would be located within 1st Street between Alameda and Vignes Streets. Tracks would rise to the east within this second portal and connect at-grade to the existing Metro Gold Line tracks toward I-605. 1st Street would be widened to the north to accommodate the portal. Widening the street would initiate at Alameda and continue east, tapering down significantly as it crosses Hewitt Street to join the existing 1st Street LRT tracks about one and half blocks west of the 1st Street Bridge.

Additional property would need to be acquired to stage construction of both portals, connect to the Gold Line LRT Bridge, and construct the tunnels beneath 2nd Street and the Nikkei Center property. The Fully Underground Alternative – Little Tokyo Variation 1 would be located entirely underground from east of the intersection of 1st and Alameda Streets to the 7th Street/Metro Center Station. There would be four proposed underground stations located at Flower/5th/6th Streets, 2nd/Hope Streets, 2nd Street/Broadway, and 2nd Street/Central Avenue.

5.5.1 Direct Impacts – Construction and Operation

The Fully Underground LRT Alternative – Little Tokyo Variation 1 could affect the pedestrian environment, motorist safety, and emergency response times for emergency service providers during both construction and LRT operation. Identified concerns from Section 4 have been reviewed within the context of this alternative, and key potential issues related to pedestrian and motorist safety have been identified. Table 5-3 lists these potential effects. CEQA guidelines on safety and security regarding pedestrian safety, station accidents and collisions, police and fire response, and criminal activity are addressed in the following sections.

5.5.1.1 Pedestrian and Motorist Safety, Station Accidents, and Collisions

The pedestrian safety assessment along the proposed LRT corridor focused on three separate categories, including:

- Pedestrian safety at station locations
- Pedestrian safety near the trackway
- Pedestrian safety at designated grade crossings

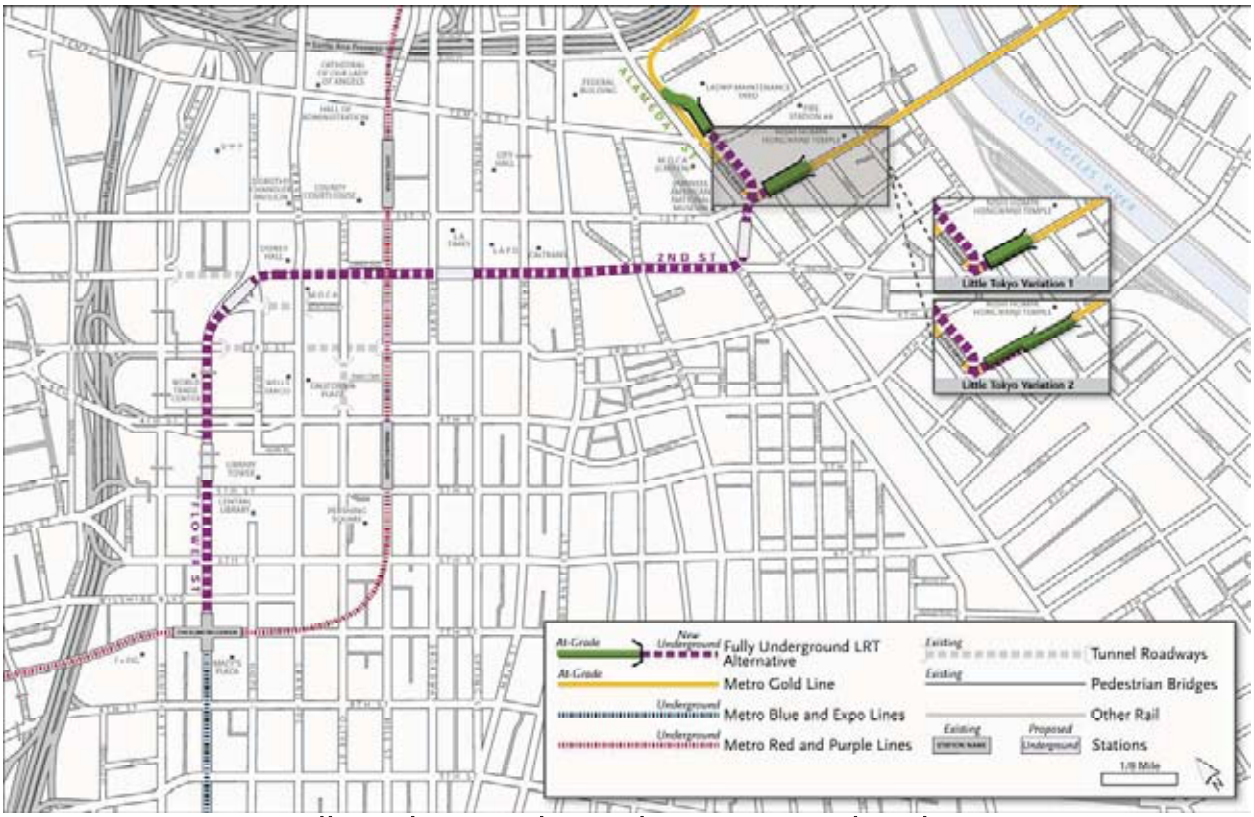

Figure 5-5. Fully Underground LRT Alternative – Little Tokyo Variation 1

The safety considerations identified previously would apply primarily to proposed at-grade locations. These concerns do not arise with underground LRT facilities (there are no trackway crossings for pedestrians or vehicles); for at-grade locations the stations can be designed to avoid these concerns (e.g., a design that avoids the need for pedestrians to cross tracks and the potential for collisions with light rail vehicles). Since the Fully Underground LRT Alternative – Little Tokyo Variation 1 includes four underground stations along the planned route, the stations would be designed to avoid potential safety hazards and prevent or avoid the need for pedestrians to cross trackways as they enter or depart the station. Stations would also be appropriately sized to accommodate the anticipated number of passengers. These design solutions would reduce this potential impact to less than significant level.

The Fully Underground LRT Alternative – Little Tokyo Variation 1 results in the entire LRT facility being placed underground, eliminating all potential conflicts with at-grade roadway and pedestrian infrastructure. In that regard, the proposed alternative and associated design would avoid potential safety effects related to both pedestrian and motorist crossings. The grade-separated nature of the Fully Underground LRT Alternative – Little Tokyo Variation 1 would avoid these potential effects and no impact would occur.

5.5.1.2 Security

Security issues may be related to police and fire response, emergency evacuation and responses, and addressing criminal and terrorist activity. To mitigate potential safety and security concerns, a complete Threat and Vulnerability Assessment in compliance with FTA regulations would be conducted for the locally preferred alternative when one is selected.,

Police and Fire Response

Standard specifications and traffic work plans would be developed to minimize potential construction impacts on emergency service providers by reducing potential impacts on emergency response times. The project would include coordination with police and fire services to develop construction and operation plans that would provide appropriate safety and security of the public using the Metro system, employees, and the surrounding communities. The LACSD policing contract with Metro would be extended to include the Regional Connector project, and the project would be coordinated and compliant with TSA/DHS. Potential impacts would be reduced to a less than significant level by implementing these measures.

LAFD Station #3 is located at the corner of 1st Street and Fremont Avenue, about 0.25 mile away from a section of the Fully Underground LRT Alternative – Little Tokyo Variation 1 alignment. This portion of the alignment is not expected to affect fire response times because it would be underground. LAFD Station #4 is located at Temple and Garey Streets, less that 0.25 mile away from the proposed underground station at 2nd Street/Central Avenue. Emergency response times will neither improve nor degrade over existing conditions because: 1) at-grade roadway conditions will essentially remain unchanged from an operational perspective and 2) the LRT alignment is fully underground as it passes underneath the congested intersection of 1st and Alameda Streets.

Fire safety in particular is addressed through design considerations. Metro's *Fire/Life Safety Design Criteria* outline specific requirements for fire protection at stations, along the alignment, and within LRVs. Identified requirements include providing fire alarm control systems at each enclosed station facility and a public address system at each station. All LRVs would be equipped with fire extinguishers, and fans to ventilate the LRV in case of fire.

LRV fire hazards would be minimized by specifying construction materials with minimum burning rates, smoke generation, and toxicity characteristics. Additional design criteria address emergency responder access, passenger egress standards, and standards for sprinkler systems and standpipe connections for fire response. Adherence to these standards

and federal, state, and local regulations, in conjunction with the low risk of fires at stations, would result in a less than significant impact to safety and security.

Crime and Terrorist Activity

Depending on the type of construction, and also the construction sequencing, temporary barricades and fencing would be used to prevent unauthorized personnel from entering construction areas, especially after hours and/or when construction is dormant. This is especially important when construction activities expose underground utilities and/or when excavated trenches have been created and left in an open state.

There is the potential for security issues to occur such as assault or robbery on the proposed project. These concerns would be addressed by applying design considerations and providing law enforcement personnel on the transit system during hours of operation. Every station would be well lit to provide visibility around the entire station day and night, as specified by City requirements and Metro *Design Criteria*.

The stations and LRVs would be equipped with closed-circuit TV systems monitored by Metro personnel. Additionally, emergency call boxes would be available in all stations for passenger use in case of emergency, and LRVs would have an operator that could be contacted by passengers via an intercom system.

The Fully Underground LRT Alternative – Little Tokyo Variation 1 presents a different set of conditions than both the At-Grade Emphasis LRT Alternative and the Underground Emphasis LRT Alternative because there are four underground stations and the entire alignment is below grade. Some of these altered conditions might include:

- Activity in underground stations and tunnels would be out of the general public view, and less observable by routine neighborhood security/police patrols in the general area, as compared to street level facilities.
- Tunnels may offer non-domiciled persons refuge from the elements.
- Staircases and passageways may create opportunities for criminal activity.
- Tunnels offer a greater consequence to train service should trespassers enter; clearance and concealment issues may arise.
- Limited access to stations and the LRT system results in greater control and ability to monitor activities in an underground system.
- Underground system operation may be more reliable.

The Fully Underground LRT Alternative – Little Tokyo Variation 1 would be less vulnerable to disruptions from public demonstrations and impacts from vehicle-borne improvised explosive devices. By controlling entries, an underground system may continue to function during

public demonstrations and large-scale disturbances at grade level. However, terrorist groups have recently struck at underground rail systems in some of the major capitols of the world, including London and Tokyo.

In addition, underground systems have a greater potential for safety issues related to evacuation needs. A complete Threat and Vulnerability Assessment in compliance with FTA regulations would be conducted for the locally preferred alternative when one is selected. For the Fully Underground LRT Alternative – Little Tokyo Variation 1 this would include a complete evacuation plan to mitigate potential safety concerns.

5.5.2 Indirect Impacts – Construction and Operation

Potential indirect impacts associated with the Fully Underground LRT Alternative – Little Tokyo Variation 1 would not have a detrimental or increased impact on public safety or accidents during both construction and LRT operation. A potential indirect impact could be increased ridership created by increased public transportation service for the overall LRT system through the system-wide connections provided by the Regional Connector project. This increased demand could have both beneficial and adverse effects. Transit-oriented developments could create more pedestrian-appropriate and safe environments and/or could cause an increase in the number of people in a defined geographic area, potentially resulting in new conflicts between pedestrians and motorists.

Stations would be appropriately sized to accommodate the anticipated number of passengers. The Fully Underground LRT Alternative – Little Tokyo Variation 1 would result in the entire LRT facility being placed underground, which would eliminate all conflicts with at-grade roadway and pedestrian infrastructure. In that regard, the proposed alternative and associated design would avoid potential safety effects related to both pedestrian and motorist crossings.

5.5.3 Cumulative Impacts – Construction and Operation

Potential cumulative impacts of the Fully Underground LRT Alternative – Little Tokyo Variation 1 are qualitatively assessed in parallel to other known projects out to the baseline year (year 2035). Within the area of influence of this proposed alternative, there are a variety of major renovations to existing buildings, new facility construction, transportation projects, and mixed-use developments under consideration. Each of these projects would address safety and security of pedestrians and motorists accessing the developments. From a cumulative perspective, potential impacts associated with the Fully Underground LRT Alternative – Little Tokyo Variation 1 would be mitigated to a less than significant level and would not have a cumulative effect on the safety and security environment in the project area during both construction and LRT operation.

[1] *A leg of an intersection is the street segment that forms one part of the intersection. For example, the north leg would be the street that forms the northern portion of an intersection.*

5.6 Fully Underground LRT Alternative – Little Tokyo Variation 2

The Fully Underground LRT Alternative - Little Tokyo Variation 2 (Figure 5-6) would provide four new stations and a direct connection from 7th Street/Metro Center Station to the Metro Gold Line tracks north and east of 1st and Alameda Streets. The alignment would extend underground from the 7th Street/Metro Center Station under Flower Street to 2nd Street. The tracks would then proceed east underneath the 2nd Street tunnel and 2nd Street to Central Avenue. At 2nd and Central, the tracks would continue underground heading northeast under 1st and Alameda Streets.

A new two-level junction would be constructed underground beneath the 1st and Alameda Street intersection. Trains would rise to the surface north and east of the junction through new portals to connect to the Metro Gold Line heading north to Azusa and east to I-605. One portal containing the northbound and southbound tracks to Azusa would be located northeast of the existing Little Tokyo/Arts District Station and tracks. This portal would rise to the north within the LADWP Maintenance Yard and connect to the existing LRT bridge over US-101, allowing a connection to the Metro Gold Line to Azusa.

The portal would be connected to the 1st and Alameda Street junction by a new cut-and-cover tunnel crossing beneath Temple Street and the property proposed for the Nikkei Center on the northeast corner of 1st and Alameda Streets, and run immediately east of the existing Little Tokyo/Arts District station and tracks.

Two portals, each containing one track, would rise to the east within the widened median of 1st Street to allow a connection to the Metro Gold Line to the San Gabriel Valley. The portal containing the westbound track would be located between Alameda and Garey Streets. The portal containing the eastbound track would be located adjacent to the westbound track between Hewitt and Vignes Streets.

1st Street would be widened to the north to accommodate the westbound portal. Widening would be initiated at Alameda and continue east, tapering down significantly as it crosses Hewitt Street; there the new tracks would feed into the existing 1st Street LRT tracks, about a half block west of the 1st Street Bridge.

1st Street would also be widened to the south between Hewitt and Vignes Streets to accommodate the eastbound track portal. Street widening would taper down as it approaches Vignes Street. No modification to the 1st Street Bridge would be necessary. Additional property would need to be acquired to stage construction of both portals, connect to the Gold Line LRT bridge, and construct the tunnels beneath 2nd Street and the Nikkei Center property. The Fully Underground Alternative – Little Tokyo Variation 2 would be located entirely underground from east of the intersection of 1st and Alameda Streets to the 7th Street/Metro Center Station.

5.6.1 Direct Impacts – Construction and Operation

The Fully Underground LRT Alternative – Little Tokyo Variation 2 could affect the pedestrian environment, motorist safety, and emergency response times for emergency service providers during both construction and LRT operation. Concerns identified in Section 4 have been reviewed within the context of this alternative, and key potential issues related to pedestrian and motorist safety have been identified. Table 5-4 lists these potential effects. CEQA guidelines on safety and security regarding pedestrian safety, station accidents and collisions, police and fire response, and criminal activity are addressed in the following sections.

5.6.1.1 Pedestrian and Motorist Safety, Station Accidents, and Collisions

The pedestrian safety assessment along the proposed LRT corridor focused on three separate categories, including:

- Pedestrian safety at station locations
- Pedestrian safety near the trackway
- Pedestrian safety at designated grade crossings

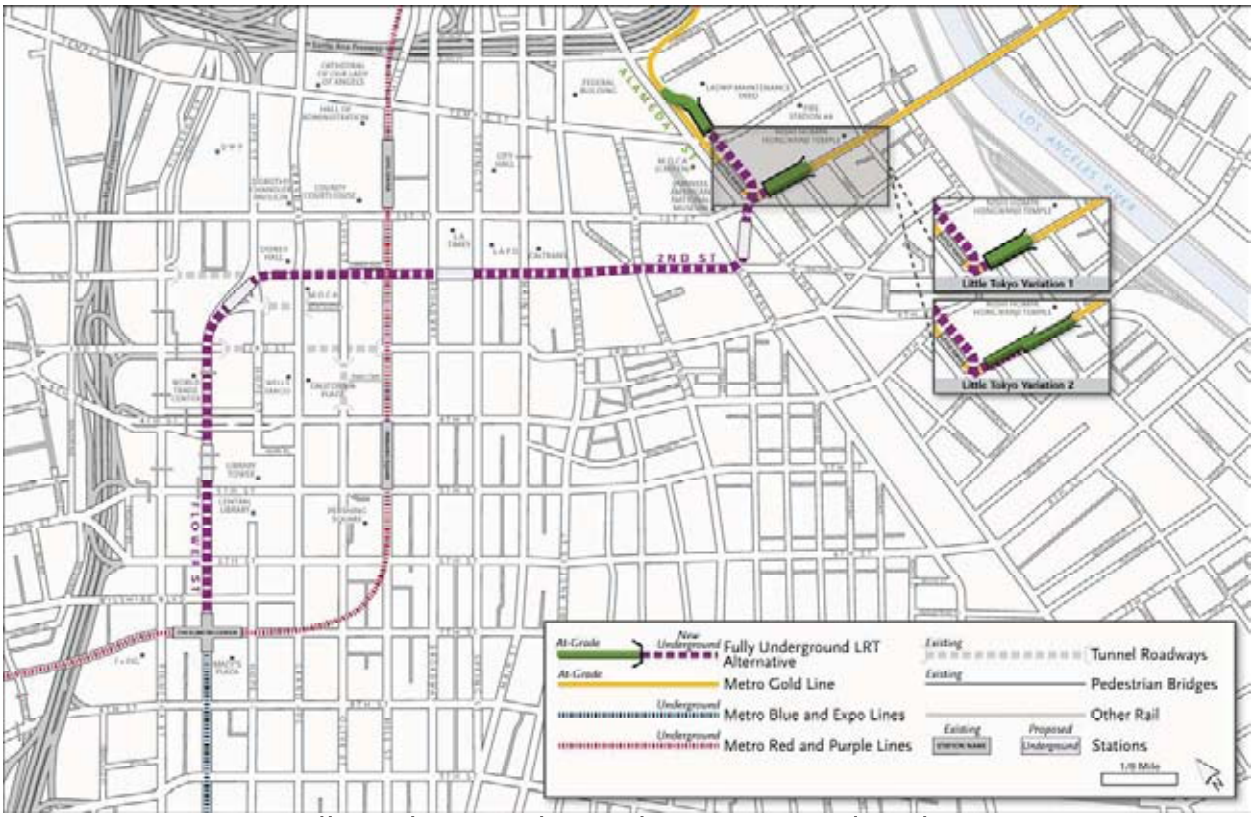

Figure 5-6. Fully Underground LRT Alternative – Little Tokyo Variation 2

The safety considerations identified previously apply primarily to proposed at-grade locations. These concerns do not arise with underground LRT facilities (there are no trackway crossings for pedestrians or vehicles) and the stations can be designed to avoid these concerns (e.g., a design that avoids the need for pedestrians to cross tracks and the potential for collisions with light rail vehicles).

The Fully Underground LRT Alternative – Little Tokyo Variation 2 includes four underground stations along the planned route. These stations would be designed to avoid potential safety hazards and prevent or avoid the need for pedestrians to cross trackways as they enter or depart the station. Additionally, stations would be appropriately sized to accommodate the anticipated number of passengers. These design solutions would reduce this potential impact to a less than significant level.

The Fully Underground LRT Alternative – Little Tokyo Variation 2 would result in the entire LRT facility being placed underground, eliminating conflicts with at-grade roadway and pedestrian infrastructure. In that regard, the proposed alternative and associated design would avoid potential safety effects related to both pedestrian and motorist crossings. The grade-separated nature of the Fully Underground LRT Alternative – Little Tokyo Variation 2 would avoid these potential effects and no impact would occur.

5.6.1.2 Security

Security issues may be related to police and fire response, emergency evacuation and responses, and addressing criminal and terrorist activity. A complete Threat and Vulnerability Assessment in compliance with FTA regulations to mitigate potential safety and security concerns would be conducted for the locally preferred alternative when one is selected.

Police and Fire Response

Standard specifications and traffic work plans would be developed to minimize potential construction impacts on emergency service providers by reducing potential impacts on emergency response times. The project would include coordination with police and fire services during development of construction and operation plans to provide appropriate safety and security of the public using the Metro system, employees, and the surrounding communities.

The LACSD policing contract with Metro would be extended to include the Regional Connector project, and the project would be coordinated and compliant with TSA/DHS. Potential impacts would be reduced to a less than significant level by implementing these measures.

LAFD Station #3 is located at the corner of 1st Street and Fremont Avenue, about 0.25 mile away from a section of the Fully Underground LRT Alternative – Little Tokyo Variation 2 alignment. This portion of the alignment is not anticipated to affect fire response times because it would be underground.

LAFD Station #4 is located at Temple and Garey Streets, less that 0.25 mile away from the proposed 2nd Street/Central Avenue stations. Emergency response times will neither improve nor degrade over existing conditions because: 1) at-grade roadway conditions will essentially remain unchanged from an operational perspective, and 2) the LRT alignment would be fully underground as it passes underneath the congested intersection of 1st and Alameda Streets..

Fire safety in particular is addressed through design considerations. Metro's *Fire/Life Safety Design Criteria* outline specific requirements for fire protection at stations, along the alignment, and within LRVs. Requirements include providing fire alarm control systems at each enclosed station facility and and a public address system at each station.

All LRVs would be equipped with fire extinguishers, and fans to ventilate the LRV in case of fire. LRV fire hazards would be reduced by specifying construction materials with minimum burning rates, smoke generation, and toxicity characteristics.

Additional design criteria address emergency responder access, passenger egress standards, and standards for sprinkler systems and standpipe connections for fire response. Adherence to these standards and federal, state, and local regulations in conjunction with the low risk of fires at stations would result in a less than significant impact to safety and security.

Crime and Terrorist Activity

Depending on the type of construction, and also the construction sequencing, temporary barricades and fencing would be used to prevent unauthorized personnel from entering construction areas, especially after hours and/or when construction is dormant. This is especially important when construction activities expose underground utilities and/or when excavated trenches have been created and left in an open state.

There is a potential for security issues to occur such as assault or robbery on the proposed project. These concerns would be addressed by design considerations and providing law enforcement personnel on the transit system during hours of operation.

Every station would be well lit to provide visibility around the entire station day and night, as specified by City requirements and Metro *Design Criteria*. The stations and the LRVs would be equipped with closed-circuit TV systems monitored by Metro personnel. Additionally, emergency call boxes would be available in all stations for passenger use in case of emergency, and each LRV would have an operator that could be contacted by passengers via an intercom system.

The Fully Underground LRT Alternative – Little Tokyo Variation 2 presents a different set of conditions than both the At-Grade Emphasis LRT Alternative and the Underground Emphasis LRT Alternative because there are four underground stations and the entire alignment is below grade. Some of these altered conditions might include:

- Activity in underground stations and tunnels would be out of the general public view, and less observable by routine neighborhood security/police patrols in the general area, compared to street level facilities.
- Tunnels may offer non-domiciled persons refuge from the elements.
- Staircases and passageways may create opportunities for criminal activity.
- Tunnels offer a greater consequence to train service should trespassers enter; clearance and concealment issues may arise.
- Limited access to stations and the LRT system results in greater control and ability to monitor activities in an underground system.
- Underground system operation may be more reliable.

The Fully Underground LRT Alternative – Little Tokyo Variation 2 would be less vulnerable to disruptions from public demonstrations and to impacts from vehicle-borne improvised explosive devices. By controlling entries, an underground system may continue to function during public demonstrations and large-scale disturbances at grade level. However, terrorist groups have recently struck at underground rail systems in some of the major capitols of the world, including London and Tokyo.

In addition, underground systems have a greater potential for safety issues related to evacuation needs. A complete Threat and Vulnerability Assessment in compliance with FTA regulations would be conducted for the locally preferred alternative when one is selected. For the Fully Underground LRT Alternative – Little Tokyo Variation 2 this would include a complete evacuation plan to mitigate potential safety concerns.

5.6.2 Indirect Impacts – Construction and Operation

Potential indirect impacts that may be associated with the Fully Underground LRT Alternative – Little Tokyo Variation 2 would not have a detrimental or increased effect on public safety or accidents during both construction and LRT operation. A potential indirect impact could be increased ridership created by increased public transportation service for the overall LRT system through the system-wide connections provided by the Regional Connector project. This increased demand could have both beneficial and adverse effects. Transit-oriented developments could create more pedestrian appropriate and safe environments and/or cause an increase in the number of people in a defined geographic area, potentially resulting in new conflicts between pedestrians and motorists.

As indicated previously, stations would be appropriately sized to accommodate the anticipated number of passengers. In addition, the Fully Underground LRT Alternative – Little Tokyo Variation 2 results in the entire LRT facility being placed underground, eliminating conflicts with at-grade roadway and pedestrian infrastructure. In that regard, the proposed

alternative and associated design would avoid potential safety effects related to both pedestrian and motorist crossings.

5.6.3 Cumulative Impacts – Construction and Operation

Potential cumulative impacts of the Fully Underground LRT Alternative – Little Tokyo Variation 2 are qualitatively assessed in parallel to other known projects out to the baseline year (year 2035). Within the area of influence of this proposed alternative there are a variety of major renovations to existing buildings, new facility construction, transportation projects, and mixed-use developments under consideration. Each of these projects would address safety and security of pedestrians and motorists accessing the developments.

From a cumulative perspective, potential impacts associated with the Fully Underground LRT Alternative – Little Tokyo Variation 2 would be mitigated to a less than significant level and would not have a cumulative effect on the safety and security environment in the project area during both construction and LRT operation.

Presence of Adequate Lighting	None observed	OK – standard luminaires located on all four quadrants of intersection	OK – standard luminaires located on all four quadrants of intersection		

[1] *A leg of an intersection is the street segment that forms one part of the intersection. For example, the north leg would be the street that forms the northern portion of an intersection.*

6.0 POTENTIAL MITIGATION MEASURES

All proposed mitigation measures regarding safety and security would be developed in conformance with Metro's *Rail Transit Design Criteria and Standards, Fire/Life Safety Criteria, Volume IX*. The criteria specifically address fire protection requirements for the design and construction of LRT systems. The criteria identify and discuss fire safety as it corresponds to the following specific design criteria: station and guideway facilities, passenger vehicles, vehicle yard and maintenance facilities, system fire/life safety procedures, communications, rail operations control, and inspection, maintenance and training. The criteria establish minimum requirements that would provide for the protection of life and property from the effects of fire. Proposed safety and security mitigation recommendations would be based on the results of and part of the Threat and Vulnerability Assessment that will be conducted for the locally preferred alternative when one is selected. These security measures may include:

- A closed circuit TV system
- Emergency push-button call system for patrons
- Intrusion detection system
- Dedicated security patrol protocols and procedures
- Employing "Crime Prevention through Environmental Design" principles during design phase

The presence of transit workers in underground stations further dissuades persons from committing offenses. Several underground systems in the United States have successfully employed security technology and patrol methods to mitigate crime conditions in underground systems, resulting in fewer offenses committed in the transit system than in the neighborhoods they traverse.

The potential mitigation measures discussed in the following sections are grouped by those that would apply to construction-related effects and by those that would apply to operation of at-grade facilities or underground portions of a proposed alignment.

6.1 Potential Construction Mitigation Measures

- Provide alternate walkways for pedestrians around construction staging sites in accordance with American with Disability Act (ADA) requirements.
- Sign and properly mark all pedestrian detour locations around staging sites in accordance with the Manual on Uniform Traffic Control Devices "work zone" guidance, and other applicable local and state requirements.
- Coordinate work plans and traffic control measures with emergency responders to prevent effects to emergency response times.

- Metro would develop a Construction Mitigation Program during final design and implement during construction. The Program would guide Metro in communicating to the community and obtaining input from residents and businesses affected during construction. This would included communicating traffic control measures, schedule of activities and duration of operations.

6.2 Potential Operational Mitigation Measures

6.2.1 Specific to At-Grade Conditions

- To reduce potential risk of collisions between LRVs and automobiles on the street portion of the proposed At-Grade Emphasis LRT Alternative, Metro would coordinate with the CPUC, City of Los Angeles and the Los Angeles County traffic control departments, Bureau of Engineering, and the City and County Fire departments, and also comply with the Federal Highway Administration's Manual on Uniform Traffic Control Devices for signing and pavement marking treatments.

- All stations would be lighted to avoid shadows and all pedestrian pathways leading to/from sidewalks and parking facilities would be well illuminated. In addition, lighting would provide excellent visibility for train operators to be able to react to possible conflicts, especially to pedestrians crossing the track.

- Proposed station designs would not include design elements that obstruct visibility or observation nor provide discrete locations favorable to crime; pedestrian access to at-grade stations would be at ground-level with clear sight lines.

- Sidewalk widths and placements would be designed appropriately to accommodate a wide variety of users. In areas directly adjacent to the rail stations: 1) sidewalk widths would be designed with the widest dimensions feasible in conformance with the Los Angeles/Metro's adopted "Land Use/Transportation Policy," and with widths exceeding 10 feet; 2) minimum widths would not be less than those allowed by the State of California Title 24 access requirements, or the Americans with Disability Act design recommendations; 3) accommodating pedestrian movements and flows would take priority over other transportation improvements, including automobile access; and 4) physical improvements would ensure that all stations are fully accessible as defined in the Americans with Disabilities Act.

- A grade-separated pedestrian bridge across Alameda Street, just north of the existing Little Tokyo/Arts District Station, would be constructed to separate pedestrian movements from LRT vehicles and motorized vehicle movements under the At-Grade Emphasis LRT Alternative.

- A grade-separated pedestrian bridge across Alameda Street, just south of the existing Little Tokyo/Arts District Station, would be constructed to separate pedestrian movements from LRT and motorized vehicle movements under the Underground Emphasis LRT Alternative. Also a grade-separated pedestrian bridge across the

Metro Gold Line tracks, just south of the existing Little Tokyo/Arts District Station and east of Alameda Street, would be constructed to separate pedestrian movements from LRT and motorized vehicle movements for the Underground Emphasis LRT Alternative.

- A grade-separated pedestrian bridge across Kosciuszko Street near the proposed 2nd/Hope Street station would be constructed. The proposed pedestrian bridge would reduce potential pedestrian/LRT/vehicle conflicts by providing a separated facility for pedestrians trying to reach the station, especially from the high pedestrian generator Walt Disney Concert Hall (mitigation measure would apply to both the At-Grade Emphasis LRT Alternative and the Underground Emphasis LRT Alternative).

- Adequate pedestrian queuing and refuge areas and wide crosswalks would be provided in areas immediately around proposed stations to facilitate pedestrian mobility.

6.2.2 Specific to Underground Conditions

- The Metro Fire/Life Safety Committee has developed standard safety-related design criteria to ensure safe and adequate LRT operations in and around LRT underground stations. These include: 1) fire alarm protection within the station area, 2) a minimum of two fire emergency routes from each proposed station, 3) emergency ventilation and lighting, 4) communication systems between adjoining fire agencies, and 5) a methane detection system for each proposed station.

- Building construction for underground stations would not be less than Type I Construction as defined in the Uniform Building Code (UBC). Type I Construction is a category of building construction that sets forth design requirements that provides for safety features such as ventilation, additional egress routes, lighting, etc. Proposed stations having more than two levels below-grade or more than 80 feet to the lowest occupied level from grade would require protected level separation or other protection features to provide safe egress to the exits.

6.2.3 Applicable to both At-Grade and Underground Conditions

- For portions of the alignment where pedestrians and/or motor vehicles must cross the tracks, Metro would prepare grade crossing applications in coordination with the CPUC and local public agencies, such as LADOT, Bureau of Engineering, and the City and County Fire departments.

- All proposed LRT stations and related parking facilities would be equipped with monitoring equipment, which would primarily consist of video surveillance equipment to monitor strategic areas of the LRT stations and walkways, and/or be monitored by Metro security personnel on a regular basis.

- Metro would implement a security plan for LRT operations. The plan would include both in-car and station surveillance by Metro security or other local jurisdiction security personnel.
- Metro would coordinate and consult with the LAFD, LAPD, and LACSD to develop safety and security plans for the proposed alignment, parking facilities, and station areas.
- Light rail vehicles would be provided with front and rear safety fenders to increase light rail vehicle safety and minimize or prevent the potential for pedestrians to contact the vehicle coupler and/or fall under the LRV.
- Fire separations would be provided and maintained in public occupancy areas. Station public occupancy would be separated from station ancillary occupancy by a minimum 2-hour fire-rated wall. The only exception is that a maximum of two station agents, supervisors, or information booths may be located within station public occupancy areas when constructed of approved noncombustible materials and limited in floor area to 100 square feet.
- The diverse needs of different types of traveling public including senior citizens, disabled citizens, low income citizens, would be addressed through a formal educational and outreach campaign. The campaign would target these diverse community members to educate them on proper system use and benefits of LRT ridership.

7.0 CONCLUSIONS

A significant adverse safety and security impact for both construction and future LRT operation would occur under CEQA if an alternative would: 1) create substantial adverse safety conditions, including station accidents, boarding and disembarking accidents, right-of-way accidents, collisions, fires, and major structural failures; 2) substantially limit delivery of community safety services—including police, fire, or emergency services—to locations along the proposed alignment; 3) create the potential for increased pedestrian and/or bicycle safety risks; and/or 4) create the potential for adverse security conditions, including incidents, offenses, and crimes. There are no specific thresholds identified under NEPA.

7.1 No Build Alternative

7.1.1 NEPA Findings

There would be no safety or security impacts related to the No Build Alternative

7.1.2 CEQA Determinations

The No Build Alternative would not result in safety or security impacts.

7.2 TSM Alternative

7.2.1 NEPA Findings

There would be no safety or security impacts related to the TSM Alternative.

7.2.2 CEQA Determinations

The TSM Alternative would not result in safety or security impacts.

7.3 At-Grade Emphasis LRT Alternative

7.3.1 NEPA Findings

Potential safety and security impacts related to construction and operation of the At-Grade Emphasis LRT Alternative would be reduced to a less than significant level through the implementation of mitigation measures. This finding is described more fully in Section 7.3.2.

7.3.2 CEQA Determinations

The At-Grade Emphasis LRT Alternative would likely result in potential impacts to pedestrian safety and overall security issues during both construction and LRT operation; however, these would be mitigated by applying appropriate design criteria and implementing appropriate standards. For example, grade crossings would be equipped with warning devices based on a comprehensive hazard analysis and additional field reviews as part of the legally required CPUC grade crossing application process.

Design considerations that mitigate potential adverse impacts would be identified and incorporated into the project. The Threat and Vulnerability Assessment conducted for the locally preferred alternative when one is selected would also identify specific design features and mitigation measures that would be implemented to avoid potential safety and security concerns. Through comprehensive hazard identification, safety-oriented project design features, and the toolkit of mitigation measures indentified in Section 6.0, the proposed alternative would not result in significant adverse safety or security impacts.

7.4 Underground Emphasis LRT Alternative

7.4.1 NEPA Findings

Potential safety and security impacts related to construction and operation of the Underground Emphasis LRT Alternative would be reduced to a less than significant level through the implementation of mitigation measures. This finding is described more fully in Section 7.4.2.

7.4.2 CEQA Determinations

The Underground Emphasis LRT Alternative would likely result in potential impacts to pedestrian safety and overall security concerns during both construction and LRT operation; however, these would be much less intense than potential impacts from the At-Grade Emphasis LRT Alternative. Any potential impacts would be mitigated by applying appropriate design criteria and implementing appropriate standards.

For example, the design would include development of a comprehensive evacuation plan. Design considerations that mitigate potential adverse impacts would be identified and incorporated into the project. The Threat and Vulnerability Assessment conducted for the locally preferred alternative when one is selected would also identify specific design features and mitigation measures that would be implemented to avoid potential safety and security concerns. Through comprehensive hazard identification, safety-oriented project design features, and the toolkit of mitigation measures indentified in Section 6.0, the proposed alternative would not result in significant adverse safety and security impacts.

7.5 Fully Underground LRT Alternative – Little Tokyo Variation 1

7.5.1 NEPA Findings

Potential safety and security impacts related to construction and operation of the Fully Underground LRT Alternative – Little Tokyo Variation 1 would be reduced to a less than significant level through the implementation of mitigation measures. This finding is described more fully in Section 7.5.2.

7.5.2 CEQA Determinations

The Fully Underground LRT Alternative – Little Tokyo Variation 1 would likely result in potential impacts to pedestrian safety and overall security concerns during both construction and LRT operation; however, these would be less intense than potential impacts from either

the At-Grade Emphasis LRT or Underground Emphasis LRT Alternatives. Any potential impacts would be mitigated by applying appropriate design criteria and implementing appropriate standards.

For example, design would include development of a comprehensive evacuation plan. Design considerations that mitigate potential adverse impacts would be identified and incorporated into the project. The Threat and Vulnerability Assessment conducted for the locally preferred alternative when one is selected would also identify specific design features and mitigation measures that would be implemented to avoid potential safety and security concerns. Through comprehensive hazard identification, safety-oriented project design features, and the toolkit of mitigation measures indentified in Section 6.0, the proposed alternative would not result in significant adverse safety and security impacts.

7.6 Fully Underground LRT Alternative – Little Tokyo Variation 2

7.6.1 NEPA Findings

Potential safety and security impacts related to construction and operation of the Fully Underground LRT Alternative – Little Tokyo Variation 2 would be reduced to a less than significant level through the implementation of mitigation measures. This finding is described more fully in Section 7.6.2.

7.6.2 CEQA Determinations

The Fully Underground LRT Alternative – Little Tokyo Variation 2 would likely result in potential impacts to pedestrian safety and overall security concerns during both construction and LRT operation; however, these would be less intense than potential impacts from either the At-Grade Emphasis LRT or Underground Emphasis LRT Alternatives. Any potential impacts would be mitigated by applying appropriate design criteria and implementing appropriate standards.

For example, design would include development of a comprehensive evacuation plan. Design considerations that mitigate potential adverse impacts would be identified and incorporated into the project. The Threat and Vulnerability Assessment conducted for the locally preferred alternative when one is selected would also identify specific design features and mitigation measures that would be implemented to avoid potential safety and security concerns. Through comprehensive hazard identification, safety-oriented project design features, and the toolkit of mitigation measures indentified in Section 6.0, the proposed alternative would not result in significant adverse safety and security impacts.

1.0 SUMMARY

None of the proposed project alternatives include any housing elements that would directly increase population or employment, or that would substantially change land use and development patterns. The areas along the routes are fully urbanized, making it unlikely that increased regional connectivity would induce housing construction.

The proposed project would provide additional links within the regional transportation network, thereby increasing overall system efficiency, reducing the need to make multiple transfers from one destination to another and increasing ease of travel between the San Gabriel Valley and the Westside or Long Beach. At the corridor level, the Regional Connector Transit Corridor project, combined with supportive public policies, plans, and favorable real estate conditions, could attract transit-supportive development, including employment opportunities, higher-density residential development, and new services and amenities.

The pattern of land development could be affected by greater concentration and intensity of land use activities along the proposed route. This could result in potential secondary land use impacts, most notably close to station locations. The proposed project would not induce growth; the most likely outcome would be an acceleration and/or redistribution of planned growth.

2.0 INTRODUCTION

This technical memorandum addresses the potential population, housing, and employment growth that may occur directly or indirectly due to the project. Although the Regional Connector Transit Corridor project does not include housing units, population could nevertheless increase due to the potential for transit-oriented development. This potential growth is analyzed at local and regional levels.

3.0 METHODOLOGY FOR IMPACT EVALUATION

3.1 Regulatory Framework

3.1.1 NEPA Guidance

Guidelines established by the Council on Environmental Quality (CEQ) regarding implementation of the National Environmental Policy Act (NEPA) require evaluation of all potential environmental consequences of proposed federal activities and programs. This provision includes a requirement to examine the indirect consequences, or secondary impacts that may occur in areas beyond the immediate influence of a proposed action and at some time in the future (40 CFR 1508.8). Secondary impacts may include changes in land use, economic vitality, and population density, all of which are elements of growth. NEPA guidelines require the evaluation of reasonably anticipated growth relative to projections of growth from a federally designated Metropolitan Planning Organization (MPO).

3.1.2 Regional Growth Management Plans

Regional growth management plans are developed by the Southern California Association of Governments (SCAG), including the 2008 SCAG Regional Comprehensive Plan (RCP). SCAG is the federally designated MPO for six counties in Southern California (Los Angeles, Orange, Riverside, San Bernardino, Ventura, and Imperial).

SCAG's mission is to develop long-range regional plans and strategies that provide for efficient movement of people, goods, and information; enhance economic growth and international trade; and improve the quality of life in the Southern California region. The RCP describes an action plan for the implementation of short-term strategies and strategic, long-term initiatives and guiding principles for sustaining a livable region. The RCP focuses on specific areas of planning or resource management, including land use and housing, open space and habitat, water, energy, air quality, solid waste, transportation, security and emergency preparedness, and the economy. The Land Use chapter of the RCP addresses issues related to growth and land use in the SCAG region and describes guiding principles for development that support the overall goals of the RCP.

The 2008 SCAG Regional Transportation Plan (RTP) examines current and future transportation plans; population, housing, and employment growth; and land use data for the SCAG region to develop projections through the year 2035. The growth projections in the 2008 SCAG RTP are used as guidelines for growth in each jurisdiction. The environmental analysis utilizes these projections to establish the magnitude of impacts related to growth.

In 2004, SCAG initiated a comprehensive growth visioning process called the Southern California Compass, now called the Compass Blueprint (2004). The Compass process seeks to accommodate growth while maintaining mobility, livability, prosperity, and sustainability

goals for residents in the SCAG region.

3.1.3 CEQA Guidance

The California Environmental Quality Act (CEQA) also requires analysis of a project's potential to induce growth. CEQA Guidelines Section 15126.2(d) require that environmental documents "discuss the ways in which the Project could foster economic or population growth, or the construction of additional housing, either directly or indirectly, in the surrounding environment." Growth-inducing impacts also include removing obstacles to growth and may potentially include changes in the amount and distribution of growth.

According to the CEQA Guidelines, a project would have a significant impact if it would:

- Induce substantial population growth in an area either directly (for example, by proposing new homes and businesses) or indirectly (for example, through extension of roads or other infrastructure).

3.2 Standards of Significance

Generally, projects with growth-inducing impacts are located in isolated, undeveloped, or underdeveloped areas, necessitating the extension of major infrastructure (e.g., sewer and water facilities, roadways, etc.) or are those that could encourage "premature" or unplanned growth (i.e., "leap-frog" development). Growth-inducing impacts would be considered significant if the proposed project has the potential to induce substantial population growth in an area, either directly (for example, by proposing new homes and businesses) or indirectly (for example, extending roads or other infrastructure).

3.3 Project Area

The project would be located in the central downtown area of the City of Los Angeles. The project build alternative alignments would traverse an area that includes several communities within the City of Los Angeles, including the Financial District, Bunker Hill, Civic Center, Little Tokyo, and the Historic Core.

The project area is in the City of Los Angeles Council of Governments (CLACG), a subregion of SCAG, which, in addition to the City of Los Angeles, also includes the City of San Fernando and portions of the unincorporated areas of Los Angeles County. The analysis of direct and indirect regional growth focuses not only on downtown Los Angeles growth, but also on growth in the areas served by the transit lines that would utilize the Regional Connector in Los Angeles County (Long Beach, Pasadena, Culver City, and East Los Angeles).

The analysis of the potential for direct and indirect local growth focuses on the area adjacent to the proposed transit alignment and stations extending ¼ mile to either side.

3.4 Evaluation Methodology

Federal Transit Administration (FTA) guidelines require that regional growth projections be created by the MPO. As mentioned previously, SCAG is the MPO for the project area. In order to evaluate potential growth-inducing impacts, the SCAG 2008 RTP Integrated Growth Forecast will be used as the basis for analysis of impacts. This regional perspective can be helpful in understanding the overall projected increases in population when determining whether a proposed project would induce growth. Population, household, and employment data for the project area are presented in the next section.

4.0 AFFECTED ENVIRONMENT

4.1 Regional Population, Housing, and Employment Growth

As shown in Table 4-1, the existing population for the region is more than 18 million persons. The region is estimated to have a population of more than 24 million persons, with 10.2 million persons employed by 2035—an increase of approximately 26 percent.

The population and employment in Los Angeles County are projected to increase by 1.8 million people and 542,574 jobs between 2008 and 2035. This represents an estimated average annual increase of approximately 69,953 persons and 20,095 jobs. The fastest growing area is Imperial County, which is estimated to grow at a rate of approximately 2.7 percent annually; the slowest is Orange County, with a growth rate of less than 1 percent (0.5) annually. Imperial County is also projected to have the fastest growth in employment, with an estimated annual increase of 3.7 percent. Los Angeles County is estimated to experience the slowest rate of job growth with an annual rate of 0.4 percent.

Table 4-1. Regional Population, Households, and Employment from 2008-2035

County	2008 Population	2035 Population	2008 Households	2035 Households	2008 Employment	2035 Employment
Imperial	186,041	320,448	51,987	102,878	66,703	132,551
Los Angeles	10,449,883	12,338,620	3,298,886	4,003,501	4,498,598	5,041,172
Orange	3,210,499	3,653,990	1,015,502	1,118,490	1,698,090	1,981,901
Riverside	2,112,571	3,596,680	675,135	1,183,097	728,067	1,413,522
San Bernardino	2,095,180	3,133,801	612,123	972,561	766,044	1,254,749
Ventura	841,675	1,013,733	268,967	330,189	361,942	463,227
SCAG Region	**18,054,174**	**24,057,292**	**5,922,600**	**7,710,716**	**8,118,444**	**10,287,122**

Source: Southern California Association of Governments 2008 Final Adopted Integrated Growth Forecast, May 2008.

Along with increases in population and job growth, the region is estimated to add approximately 1.7 million households, for a total of 7.7 million. Imperial and Riverside Counties are estimated to grow most rapidly at an annual rate of 3.6 percent and 2.8 percent, respectively. Los Angeles County is estimated to increase households at a rate of 0.8 percent annually and Orange County is estimated to have the lowest annual growth rate at 0.4 percent.

4.2 Local Population, Housing, and Employment Growth

This section provides population, housing, and employment growth estimates for the collection of census tracts that comprise the project area. For comparison purposes, this section also includes data from the City of Los Angeles and the City of Los Angeles Council of Governments (CLACG). CLACG includes the City of Los Angeles, the City of San Fernando, and portions of unincorporated Los Angeles County.

Table 4-2 shows population growth projections at the local level. The project area's population is estimated to increase by approximately 3,200 persons by 2035, with an annual average increase of less than 1 percent (0.51). This would be a greater growth rate than either the CLACG subregion or the City of Los Angeles.

Table 4-2. Local Area Population Growth 2008-2035

Area	2008	2035	2008-2035 Population Change	2008-2035 Annual Average % Change
CLACG	4,099,008	4,509,435	410,427	0.37
City of Los Angeles	4,016,324	4,415,773	399,449	0.37
Project Area /a/	19,912	23,123	3,211	0.51

Source: Southern California Association of Governments 2008 Final Adopted Integrated Growth Forecast, May 2008.
/a/ *The project area is comprised of the following census tracts: 2060.30, 2060.40, 2062, 2073, 2074, 2075, 2077.10.*

Table 4-3 shows the expected household growth for the project area, City of Los Angeles, and CLACG subregion. The City of Los Angeles is estimated to increase by 274,285 households and would comprise approximately 21 percent of the region's total households. The project area is estimated to increase by 2,552 households, which would be a minimal share of the City of Los Angeles' total, and would occur at a similar rate (0.77 percent) compared to the City (0.76 percent) and the CLACG subregion (0.75 percent).

Table 4-3. Local Area Household Growth 2008-2035				
Area	2008	2035	2008-2035 Household Change	2008-2035 Annual Average % Change
CLACG	1,361,906	1,638,822	276,916	0.75
City of Los Angeles	1,342,291	1,616,576	274,285	0.76
Project Area	9,654	12,306	2,552	0.77

Source: Southern California Association of Governments 2008 Final Adopted Integrated Growth Forecast, May 2008.

Table 4-4 includes employment growth for the project area, City of Los Angeles, and CLACG subregion. The table shows that the project area is expected to gain approximately 12,630 new jobs by 2035. This would be an annual rate of change of approximately 0.26 percent. The annual rate of growth for the project area would be similar to that of the City of Los Angeles, but lower than the CLACG subregion rate.

Table 4-4. Local Area Employment Growth 2008-2035				
Area	2008	2035	2000-2008 Employment Change	2008-2035 Annual Average % Change
CLACG	1,839,988	2,037,473	197,485	0.40
City of Los Angeles	1,879,666	1,994,137	114,471	0.23
Project Area	169,328	181,962	12,634	0.26

Source: Southern California Association of Governments 2008 Final Adopted Integrated Growth Forecast, May 2008.

The Cumulative Impacts Technical Memorandum identifies developments and other transit projects in downtown Los Angeles anticipated to be completed by 2018. These include major renovation projects, new construction of both public and private buildings, transportation infrastructure projects, and utility projects. The estimates developed by the City of Los Angeles and the CLACG would reflect these anticipated projects.

5.0 IMPACTS

Growth inducing effects would be considered significant if a proposed project has the potential to induce substantial population growth in an area either directly or indirectly.

5.1 No Build Alternative

The No Build Alternative would include all existing highway and transit services and facilities, the committed highway and transit projects in Metro's 2009 Long Range Transportation Plan (LRTP), and the committed highway and transit projects in SCAG's 2008 RTP. By the projection year of 2035, the Metro Expo Line to Santa Monica, Metro Purple Line to Westwood, Metro Crenshaw Line, Metro Green Line to the South Bay and LAX, and Metro Gold Line to Azusa and the San Gabriel Valley will have opened, and a number of bus services will have been reorganized and expanded to provide connections with these new rail lines. The transit network within the project area will otherwise be largely the same as it is now.

5.1.1 Direct Impacts

Much of the project area is characterized by urban streets and dense land uses, including high-rise office buildings that dominate the downtown landscape. Under the No Build Alternative, past trends would likely continue and a substantial permanent change to the physical environment of the project area would not occur. However, because the downtown area is essentially the commercial center of the City of Los Angeles, it is projected that development would continue according to current trends. The No Build Alternative would not result in new homes or businesses, and therefore, would not directly induce growth.

5.1.2 Indirect Impacts

The desirable location and current development trends in the project area indicate that development would occur without the proposed project and that the trend for conversion of office buildings into condominiums or rental apartments, particularly in the downtown area, would continue. As such, the No Build Alternative would not indirectly induce growth.

5.1.3 Cumulative Impacts

Since the No Build Alternative would not directly or indirectly cause growth inducing impacts, there would be no cumulative impacts from this alternative.

5.2 Transportation Systems Management (TSM) Alternative

Under the TSM Alternative, only minor transit infrastructure investment would occur, including (but not limited to) two new express shuttle bus lines linking 7th Street/Metro Center Station and Union Station. These buses would run frequently, perhaps just a few minutes apart, especially during peak hours. The buses may also have traffic signal priority

similar to the Metro Rapid system, where the traffic signal control system grants longer green lights to oncoming transit vehicles.

Enhanced bus stops would be located every two to three blocks to maximize coverage of the area surrounding the routes. These new shuttles would also have associated structures (bus stops and signage). In addition, the same infrastructure investments that would occur under the No Build Alternative would occur under the TSM Alternative.

5.2.1 Direct Impacts

Under the TSM Alternative, only minor transportation improvements would occur. The TSM Alternative would accommodate an existing transportation need, but would not add any new housing or significantly expand transportation infrastructure. Therefore, the TSM Alternative would not directly induce growth.

5.2.2 Indirect Impacts

Minor bus improvements such as the TSM Alternative do not typically result in the types of transit-oriented growth that tends to occur near fixed-transit stations. As such, the TSM Alternative would not provide opportunities for secondary development. Although some growth would likely occur based on past development trends, it is unlikely that it would result from such minor transportation improvements. Therefore, the TSM Alternative would not indirectly induce growth.

5.2.3 Cumulative Impacts

Since the TSM Alternative would not directly or indirectly cause growth inducing impacts, there would be no cumulative impacts from this alternative.

5.3 At-Grade Emphasis LRT Alternative

The At-Grade Emphasis Light Rail Transit (LRT) Alternative extends from the underground 7th Street/Metro Center Station, heads north under Flower Street, resurfaces to at-grade north of 4th Street, crosses 3rd Street at-grade, enters Bunker Hill, and turns northeast through a new entrance to the existing 2nd Street tunnel. The double track alignment continues along 2nd Street to Main Street, where it splits into an at-grade couplet configuration traveling north on Main and Los Angeles Streets (one track on each roadway).

The alignment then heads east on Temple Street, realigns into a dual-track configuration just east of Los Angeles Street, and connects to the Metro Gold Line north of the Little Tokyo/Arts District Station on Alameda Street. Due to the high volume of trains that would traverse the Regional Connector, an automobile underpass and proposed pedestrian overpass would be constructed at the intersection of Temple and Alameda Streets to reduce potential pedestrian/train and automobile/train conflicts. To implement this alternative, the existing

number of traffic lanes and on-street parking on 2nd, Main, Los Angeles, and Temple Streets would be reduced.

This alternative includes three proposed stations located near Flower Street and 5th Street; under Bunker Hill; and one couplet station with a northbound platform at Los Angeles and 1st Streets, and a southbound platform at Main and 1st Streets.

5.3.1 Direct Impacts

An important objective of the proposed project is to meet existing transportation demand and accommodate potential increased demand due to regional growth. The proposed project would provide a linkage in the regional transportation network, thereby increasing overall system efficiency. The At-Grade Emphasis LRT Alternative does not include a housing element that would directly increase population or employment and it would not substantially change land use and development patterns at the regional scale. Therefore, this alternative would not directly induce population growth.

At the regional level, the proposed project would reduce the need to make several transfers from one destination to another, resulting in increased efficiency of travel between the San Gabriel Valley and the Westside or Long Beach. The areas along these routes are fully urbanized so it would be unlikely that the increased regional connectivity would induce housing construction.

5.3.2 Indirect Impacts

At the corridor level, the Regional Connector project, combined with supportive public policies, plans, and favorable real estate conditions, could attract transit-supportive development, including employment opportunities, higher-density residential development, and new services and amenities. The pattern of land development could be affected by a greater concentration and intensity of land use activities along the proposed route and particularly along the station areas, making secondary land use impacts most notable close to stations.

Experience gained from existing Metro projects such as the Purple and Red Lines suggests that developers in the Los Angeles area are interested in creating transit- and pedestrian-oriented mixed-use development, and that these types of developments can be very successful. The experience in other cities with similar transit infrastructure also supports this idea. However, policies supportive of the desired type of development must usually be in place.

Even with no change in public policy, some changes in land use may potentially occur as a result of the proposed project; however, these changes would largely represent a redistribution of growth rather than an increase. Downtown Los Angeles and Little Tokyo are currently densely developed. The transit corridor stations could attract transit-supportive land

uses to these areas. These uses could be developed in existing or new buildings on vacant lots close to the stations.

It is likely that the proposed project would enhance the attractiveness of the corridor for living or conducting business. The project could improve transit accessibility for people desiring to come to destinations within the project area and for area residents or others bound for other regional locations.

Employment opportunities may increase in the project area, and these opportunities would be enhanced by the light rail project. The proposed project would provide new job opportunities, particularly during construction, and new access to local employment opportunities for all communities within or connected to the project corridor. Short-term construction-related jobs created by the proposed project and long-term employment opportunities created by improved access would be a benefit to the entire community.

Under the At-Grade Emphasis LRT Alternative, the indirect impacts on neighborhoods would generally be positive. Station areas could become centers of neighborhood activity and investment and, therefore, could serve to boost neighborhood social cohesion and improve economic conditions for commercial buildings within the corridor and, in particular, those adjacent to the stations. The Regional Connector could also encourage additional growth of existing street level retail uses in both downtown and Little Tokyo. This new accessibility could also act as a catalyst for using underutilized space in commercial buildings.

The At-Grade Emphasis LRT Alternative would not result in direct business displacement and, therefore, would not undermine the economic base of these communities. Commercial properties near stations would have a reasonable potential to increase in value - a potential secondary effect.

A low potential exists for the project to cause secondary adverse impacts to historic properties. This could occur through redevelopment at or near station areas that are adjacent to historic properties. Such development may potentially introduce new buildings at a scale and appearance that would be out of character with the historic properties, or may result in the demolition of historic buildings to accommodate new development. On the other hand, underutilized historic buildings in the corridor may increase in desirability due to their proximity to the proposed project. This could be considered a beneficial secondary impact if development is undertaken with the goal of complementing the historic setting of these resources.

Potential indirect growth-inducing effects may result from the micro-scale growth or development near proposed stations. These potential effects, described in more detail in sections 5.3.2.1 through 5.3.2.3, would be due to implementation of local and state land use

policies or local planning objectives, which may encourage transit-oriented development, station area planning, or housing density bonuses adjacent to transit corridors.

The At-Grade Emphasis LRT Alternative's potential to indirectly induce growth is speculative at this time. The At-Grade Emphasis LRT Alternative would not remove any barriers to growth, nor would it otherwise directly or indirectly induce growth.

5.3.2.1 Flower /6th/5th Streets Station

The trend of converting office buildings into condominiums or rental apartments, particularly in the downtown area, would likely continue. The construction of new condominiums and rental apartments would also likely continue, especially on vacant land in the station areas. Under the At-Grade Emphasis LRT Alternative, convenient and faster transit access to central downtown provided by the project could accelerate these trends.

The area immediately surrounding the proposed Flower /6th/5th Street station is currently comprised of large office towers, the Los Angeles Central Library, and large hotels. It is also very dense, with little or no vacant land. While construction of the Regional Connector in downtown could have some effect on business locations because of the change in arrival and departure patterns of transit riders, it would be unlikely to significantly alter development plans within this proposed station area. Any changes in projected land use patterns would likely be a redistribution of expected growth, potentially resulting in a greater concentration of uses near the proposed transit station.

5.3.2.2 2nd/Hope Streets Station

The proposed 2nd/Hope Street station would also be located in central downtown. Existing land uses in the vicinity of this station area include the Colburn School of Performing Arts, parcels currently used as parking lots proposed for redevelopment as a part of the Grand Avenue Redevelopment Project, the Walt Disney Concert Hall, and residential developments. Land use in the Bunker Hill area is governed by the Central City Community Plan, which shows that the General Plan land use designation for the proposed station area permits commercial and multi-family residential land uses at an average Floor Area Ratio (FAR) of 6:1. In addition, the Central City Community Plan specifies that the FAR on an individual parcel may not exceed 13:1, consistent with previously established regulations for the underlying height district.

Further, the Downtown Specific Plan contemplates linking Bunker Hill with the existing transit network. While it is possible that new development would locate near the station area, it would be unlikely that the Regional Connector would induce growth into the Bunker Hill area beyond what is currently expected and planned.

5.3.2.3 Main/1st Street and Los Angeles/1st Street Stations

The proposed Main/1st Street and Los Angeles/1st Street stations would function as a couplet, with trains on Main Street traveling southbound only and trains on Los Angeles Street traveling northbound only. The proposed Main/1st Street station area is surrounded primarily by civic uses, including City Hall, City Hall East, Caltrans District 7 Headquarters, the new Los Angeles Police Department (LAPD) Administration Building, and the Kyoto Grand Hotel. Opportunities for redevelopment are limited from Main Street to the west because potential development would be constrained by existing buildings.

The area surrounding the proposed Los Angeles/1st Street station would likely experience some secondary effects due to the Regional Connector. Although the area is dominated by civic uses, several vacant parcels or surface parking lots are located within ¼ mile of the station area. In addition, Alameda and San Pedro Streets located to the east of the project site include industrial areas that in some cases have already begun converting to residential and commercial uses. Under the At-Grade Emphasis LRT Alternative, this trend would likely continue and could be accelerated.

The proposed Main/1st and Los Angeles/1st Street stations are located near Little Tokyo. Faster and more convenient access to central downtown provided by the At-Grade Emphasis LRT Alternative could accelerate existing residential development trends. Commercial development could also increase as a result of the proposed stations. Services intended for residents of Little Tokyo and downtown workers could also locate near the stations; this would allow service providers to take advantage of the access the new stations would provide. In many cases the trend for adaptive reuse of obsolete industrial, warehouse, and other office structures as residences could help to preserve currently vacant structures in the station areas that might otherwise deteriorate.

5.3.3 Cumulative Impacts

Since the At-Grade Emphasis LRT Alternative would not directly or indirectly cause growth inducing impacts, there would be no cumulative impacts from this alternative.

5.4 Underground Emphasis LRT Alternative

The Underground Emphasis LRT Alternative extends from the 7th Street/Metro Center Station north along Flower Street with a new underground station north of 5th Street. At 2nd Street, the underground tunnel would extend east with a new underground station near 2nd and Hope Streets to provide access to Bunker Hill.

A second underground station would be located either between Broadway and Spring Street or between Main and Los Angeles Streets. The tunnel would emerge to at-grade connections just southwest of the intersection of 1st and Alameda Streets. At 1st and Alameda Streets, a new underpass would carry car and truck traffic along Alameda Street below the rail junction,

and a proposed overhead pedestrian bridge structure would eliminate most potential conflicts between pedestrians and trains. This alternative would have a single at-grade crossing at the intersection of 1st and Alameda Streets.

5.4.1 Direct Impacts

The direct impacts associated with the Underground Emphasis LRT Alternative would be the same as those under the At-Grade Emphasis LRT Alternative. For this analysis, refer to Section 5.3.1 of this technical memorandum.

5.4.2 Indirect Impacts

The indirect impacts associated with the Underground Emphasis LRT Alternative would be similar to those under the At-Grade Emphasis LRT Alternative. The proposed station locations are slightly different for this alternative than those described for the At-Grade Emphasis LRT Alternative. The specific station locations proposed for the Underground Emphasis LRT Alternative are described in more detail in sections 5.4.2.1 through 5.4.2.3.

5.4.2.1 Flower /5th/4th Street Station

The area immediately surrounding the proposed Flower /5th/4th Street station is very dense with little or no vacant land and currently comprised of large office towers, the Los Angeles Central Library, and large hotels. While the construction of the Underground Emphasis LRT Alternative in downtown could have some effect on business locations because of the change in arrival and departure patterns of transit riders, it would be unlikely to significantly alter development plans within this proposed station area.

5.4.2.2 2nd/Hope Street Station

Impacts associated with the proposed 2nd/Hope Streets station would be similar to the At-Grade Emphasis LRT Alternative.

5.4.2.3 2nd Street Station - Broadway Option

The proposed station located at Broadway and 2nd Street would be in an area currently characterized by a mix of office uses and some underutilized parcels. In general, conversion of vacant or underutilized parcels to commercial or residential uses has become more frequent in this area. Due to the close proximity to central downtown, this site would likely experience growth in either housing or commercial development. This development would likely be accelerated or redistributed as a result of the proposed project.

As part of this proposed station area, Metro is proposing to acquire a surface parking lot and part of the planned Federal Courthouse property on the northwest corner of Broadway and 2nd Street. It is likely that Metro would make the remainder of the parcel available for development at a later date and that the potential development would be consistent with the compact style of transit-oriented development. However, any development that would occur

on that parcel would be subject to additional environmental review. Nonetheless, the most likely secondary impact of this proposed station location would be the possible acceleration of already anticipated growth.

5.4.2.4 2nd Street Station - Los Angeles Street Option

The proposed 2nd Street station - Los Angeles Street Option would be located adjacent to the Kyoto Grand Hotel and the "Block 8" residential and retail development currently under construction. Located to the west of the proposed station area are civic uses, such as City Hall and City Hall East, and government buildings, including the proposed LAPD office and the Caltrans District 7 headquarters.

Several vacant parcels or surface parking lots are located within ¼ mile of the proposed station area. In addition, Alameda and San Pedro Streets (located to the east of the project site) include industrial areas that in some cases have already begun converting to residential and commercial uses. This area is already experiencing development of residential uses and it is expected these trends would continue.

Several surface parking lots in the area could be redeveloped as either housing or commercial uses to serve the downtown population and residents of Little Tokyo. It is likely that the proposed project would accelerate future growth and result in a redistribution of land use patterns, resulting in compact higher-density development in the proposed station area. In addition to this potential for redevelopment of vacant parcels, a portion of the surface parking lot located at the southeast corner of Los Angeles and 2nd Streets would be acquired by Metro as part of this proposed station. It would be likely that Metro would make the remainder of the parcel available for development at a later time. However, any development that would occur on that parcel would be subject to additional environmental review.

5.4.2.5 Portal Area

The portal area is the location at which the proposed alignment would exit the underground tunnel, continue at-grade, and connect to the existing Metro Gold Line. Proximity to the downtown area and recent improvements such as the Geffen Museum of Contemporary Art, the Savoy housing complex, and the Gold Line extension have increased development activity in the area of the proposed portal for the Underground Emphasis LRT Alternative.

Residences have been recently introduced in the area, greatly changing its overall character from an industrial to a residential neighborhood. Construction of new condominiums and rental apartments would likely continue, especially on vacant land in the station area.

For this alternative, Metro would propose to acquire a portion of the portal area for construction and possibly create a pedestrian overpass. The parcel is currently developed with commercial uses. After construction, the future availability of this parcel of land that Metro would have acquired and the existing and proposed development in the area indicate

that acceleration of currently anticipated growth may be a likely secondary impact at the portal area.

Possibilities for future use of this land range from plaza/open space with landscaping, to commercial development similar to what is there now, to more intense transit-oriented use - perhaps including parking. Any future use of this property would undergo the city development approval process, including environmental review, and Metro would ensure extensive input from the community to ensure that any proposed future use is compatible with and supportive of community goals.

In summary, our evaluation indicates secondary growth effects might occur in this area. However, this acceleration of currently anticipated growth would not be likely to result in substantial population growth in the area as a result of the project and therefore, this potential impact would be less than significant.

5.4.3 Cumulative Impacts

The Underground Emphasis LRT Alternative would not directly cause growth inducing impacts, and might indirectly result in some effects only at the eastern portal area. This localized indirect effect would be less than significant and in combination with other potential future developments would not result in a cumulatively considerable effect.

5.5 Fully Underground LRT Alternative – Little Tokyo Variation 1

The Fully Underground LRT Alternative – Little Tokyo Variation 1 alignment extends from the 7th Street/Metro Center Station north below Flower Street with a new underground station north of 5th Street. At 3rd Street, the alignment would extend east and a new underground station would be constructed near 2nd and Hope Streets to provide access to Bunker Hill.

From Bunker Hill, the alignment would continue east beneath 2nd Street. A third underground station would be located between Broadway and Spring Street. The alignment would continue under the Little Tokyo District and a fourth underground station would be constructed at the block bounded by Central Avenue and 1st, 2nd, and Alameda Streets. The alignment would emerge to at-grade connections with the existing Gold Line tracks via two portals: north of Temple Street and adjacent to and east of Alameda Street for the north-south line and within 1st Street east of Alameda Street for the east-west line.

5.5.1 Direct Impacts

Potential direct impacts associated with the Fully Underground LRT Alternative – Little Tokyo Variation 1 would be the same as those under Underground Emphasis LRT Alternative. For that analysis, refer to Section 5.4.1 of this technical memorandum.

5.5.2 Indirect Impacts

Potential indirect impacts associated with the Fully Underground LRT Alternative – Little Tokyo Variation 1 would be the same as those under the Underground Emphasis LRT Alternative for the following station areas:

- Flower Street/5th/4th Street station
- 2nd/Hope Street station
- 2nd Street/Broadway station

For the impact analyses of these station areas, refer to Sections 5.4.2.1, 5.4.2.2, and 5.4.2.3 of this technical memorandum.

5.5.2.1 2nd Street/Central Avenue Station

The area surrounding the proposed 2nd Street/Central Avenue station is located within the block to the south and west of the existing Metro Gold Line Little Tokyo/Arts District Station, which would not be in service under this alternative. It is likely that some development would occur near the proposed station as a result of the Fully Underground LRT Alternative – Little Tokyo Variation 1. However, due to the close proximity of the existing Metro Gold Line station, it is difficult to determine what portion of potential growth would have occurred anyway.

In addition, Alameda and San Pedro Streets to the east of the proposed station site include industrial areas that have already begun converting to residential and commercial uses. , This trend would likely continue and could only be accelerated if the Fully Underground Alternative – Little Tokyo Variation 1 is constructed.

In summary, our evaluation indicates secondary growth effects might occur in this area. However, this acceleration of currently anticipated growth would not be likely to result in substantial population growth in the area as a result of the project and therefore, this potential impact would be less than significant.

5.5.3 Cumulative Impacts

The Fully Underground LRT Alternative – Little Tokyo Variation 1 would not directly cause growth inducing impacts, and might indirectly result in some effects only near the block bounded by 1st, 2nd, and Alameda Streets and Central Avenue. This localized indirect effect would be less than significant and in combination with other potential future developments would not result in a cumulatively considerable effect.

5.6 Fully Underground LRT Alternative – Little Tokyo Variation 2

The Fully Underground LRT Alternative – Little Tokyo Variation 2 extends from the 7th Street/Metro Center Station north in a cut-and-cover tunnel below Flower Street. A new underground station would be located north of 5th Street. At 3rd Street, the underground tunnel would extend east and a new underground station would be constructed near 2nd and Hope Streets to provide access to Bunker Hill. This segment of tunnel would be constructed using either the cut-and-cover method or the sequential excavation method.

From Bunker Hill, a tunnel excavated by tunnel boring machine would continue east beneath 2nd Street. A third underground station would be located between Broadway and Spring Street. The tunnel would continue under the Little Tokyo District and a fourth underground stacked station would be constructed at the block bounded by Central Avenue and 1st, 2nd, and Alameda Streets. The alignment would emerge to at-grade connections with the existing Gold Line tracks via three portals: north of Temple Street and adjacent to and east of Alameda Street for the north-south line and staggered portals within 1st Street east of Alameda Street for the east-west line.

5.6.1 Direct Impacts

The direct impacts associated with the Fully Underground LRT Alternative – Little Tokyo Variation 2 would be the same as those under the Fully Underground LRT Alternative – Little Tokyo Variation 1.

5.6.2 Indirect Impacts

The indirect impacts associated with the Fully Underground LRT Alternative – Little Tokyo Variation 2 would be the same as those under the Fully Underground LRT Alternative – Little Tokyo Variation 1 for all the station areas. For this analysis, refer to Section 5.5.2 of this technical memorandum.

5.6.3 Cumulative Impacts

The Fully Underground LRT Alternative – Little Tokyo Variation 2 would not directly cause growth inducing impacts, and might indirectly result in some effects only near the block bounded by 1st, 2nd, and Alameda Streets and Central Avenue. This localized indirect effect would be less than significant and in combination with other potential future developments would not result in a cumulatively considerable effect.

6.0 POTENTIAL MITIGATION MEASURES

6.1 No Build Alternative

The No Build Alternative would not include new infrastructure, homes, or businesses; therefore, there would be no direct or indirect impact on growth-inducing factors and no mitigation measures would be required.

6.2 Transportation Systems Management (TSM) Alternative

The TSM Alternative would not include housing or permanent infrastructure improvements that could induce growth; therefore, there would be no direct or indirect impact on growth-inducing factors and no mitigation measures would be required.

6.3 At-Grade Emphasis LRT Alternative

6.3.1 Direct Impacts

The At-Grade Emphasis LRT Alternative would not include any housing and, therefore, would not directly induce growth. No mitigation measures would be required.

6.3.2 Indirect Impacts

The At-Grade Emphasis LRT Alternative would likely influence patterns of growth along the transit corridor, most notably in the proposed station areas. The most likely outcome would be an acceleration and/or redistribution of planned growth. The At-Grade Emphasis LRT Alternative would not indirectly induce growth. No mitigation measures would be required.

6.4 Underground Emphasis LRT Alternative

6.4.1 Direct Impacts

The Underground Emphasis LRT Alternative would not include any housing and, therefore, would not directly induce growth. No mitigation measures would be required.

6.4.2 Indirect Impacts

The Underground Emphasis LRT Alternative would likely complement patterns of growth along the transit corridor, most notably in the proposed station areas. The most likely outcome would be an acceleration and/or redistribution of planned growth. The Underground Emphasis LRT Alternative would not indirectly induce growth. No mitigation measures would be required.

6.5 Fully Underground LRT Alternative – Little Tokyo Variation 1

6.5.1 Direct Impacts

The Fully Underground LRT Alternative – Little Tokyo Variation 1 would not include any housing and, therefore, would not directly induce growth. No mitigation measures would be required.

6.5.2 Indirect Impacts

The Fully Underground LRT Alternative – Little Tokyo Variation 1 would likely complement patterns of growth along the transit corridor, most notably in the proposed station areas. The most likely outcome would be an acceleration and/or redistribution of planned growth. The Fully Underground LRT Alternative – Little Tokyo Variation 1 would not indirectly induce growth. No mitigation measures would be required.

6.6 Fully Underground LRT Alternative – Little Tokyo Variation 2

6.6.1 Direct Impacts

The Fully Underground LRT Alternative – Little Tokyo Variation 2 would not include any housing and, therefore, would not directly induce growth. No mitigation measures would be required.

6.6.2 Indirect Impacts

The Fully Underground LRT Alternative – Little Tokyo Variation 2 would likely complement patterns of growth along the transit corridor, most notably in the proposed station areas. The most likely outcome would be an acceleration and/or redistribution of planned growth. The Fully Underground LRT Alternative – Little Tokyo Variation 2 would not indirectly induce growth. No mitigation measures would be required.

7.0 CONCLUSIONS

7.1 No Build Alternative

7.1.1 NEPA Findings

Under the No Build Alternative, no more transit infrastructure investment would occur beyond those planned for and funded in the 2009 LRTP. Although additional rail lines (Metro Expo Line to Santa Monica, Metro Purple Line to Westwood, Metro Crenshaw Line, Metro Green Line to the South Bay and LAX, and Metro Gold Line to Azusa and the San Gabriel Valley) will have opened and a number of bus services will have been reorganized and expanded to provide connections with these new rail lines, the transit network within the project area would otherwise be largely the same as it is now.

Accordingly, under the No Build Alternative there would be minimal construction in the project area associated with additional transit infrastructure investment. As such, no secondary impacts would occur. Therefore, no direct or indirect adverse impacts associated with secondary growth are expected under the No Build Alternative.

7.1.2 CEQA Determination

Based on the CEQA thresholds of significance (Section 3.1.3), the No Build Alternative would not have a significant impact associated with growth inducement because it would not include construction of any housing or infrastructure. No mitigation measures are required.

7.2 Transportation Systems Management (TSM) Alternative

7.2.1 NEPA Findings

Only minor transportation improvements would occur under the TSM Alternative. The TSM Alternative would accommodate an existing transportation need, but would not add any new housing or significantly expand transportation infrastructure. In addition, the TSM Alternative would not add the type of permanent infrastructure that facilitates changes in land use patterns and density of development. Therefore, no direct or indirect growth-inducing impacts would occur.

7.2.2 CEQA Determination

The TSM Alternative would not include the addition of any new housing or expanded infrastructure. Therefore, no growth-inducing impacts would occur. No mitigation measures are required.

7.3 At-Grade Emphasis LRT Alternative

7.3.1 NEPA Findings

The At-Grade Emphasis LRT Alternative would be located within a densely developed urban setting and would not extend into undeveloped areas that may induce changes. Potential indirect growth-inducing effects may result from the micro-scale growth or development near proposed stations. These effects would be due to implementation of local and state land use policies or local planning objectives, which may encourage transit-oriented development, station area planning, or housing density bonuses adjacent to transit corridors.

Potential indirect growth would likely be similar under all build alternatives. However, the At-Grade Emphasis LRT Alternative's potential to indirectly induce growth is speculative at this time. The At-Grade Emphasis LRT Alternative would not remove any barriers to growth, nor would it otherwise directly or indirectly induce growth.

7.3.2 CEQA Determinations

Under CEQA, growth-inducing impacts would be considered significant if the proposed project has the potential to induce substantial population growth in an area, either directly (for example, by proposing new homes and businesses) or indirectly (for example, by extending roads or other infrastructure). The proposed project intends to meet the existing and future transit needs of the project area, would be located within a densely developed urban setting, and would not extend into undeveloped areas that may induce changes.

Potential indirect growth-inducing effects could result from the micro-scale growth or development near proposed stations due to implementation of local and state land use policies or local planning objectives, which may encourage transit-oriented development, station area planning, or housing density bonuses adjacent to transit corridors. However, this potential indirect growth is speculative at this time. No direct or indirect growth-inducing impacts are expected.

7.4 Underground Emphasis LRT Alternative

7.4.1 NEPA Findings

Impacts related to growth-inducement would be similar to those under the At-Grade Emphasis LRT Alternative. No direct or indirect growth-inducing impacts are expected with the exception of the potential to accelerate currently anticipated growth at and near the parcel surrounding the eastern portal. This potential indirect effect would be less than significant.

7.4.2 CEQA Determinations

Impacts related to growth-inducement would be similar to those under the At-Grade Emphasis LRT Alternative. No direct or indirect growth-inducing impacts are expected with

the exception of the potential to accelerate currently anticipated growth at and near the parcel surrounding the eastern portal. This potential indirect effect would be less than significant.

7.5 Fully Underground LRT Alternative – Little Tokyo Variation 1

7.5.1 NEPA Findings

Impacts related to growth-inducement would be similar to those under the Underground Emphasis LRT Alternative. No direct or indirect growth-inducing impacts are expected with the exception of potentially accelerating currently anticipated growth near the eastern end of the alignment. This potential indirect effect would be less than significant.

7.5.2 CEQA Determinations

Impacts related to growth-inducement would be similar to those under the Underground Emphasis LRT Alternative. No direct or indirect growth-inducing impacts are expected with the exception of potentially accelerating currently anticipated growth near the eastern end of the alignment. This potential indirect effect would be less than significant.

7.6 Fully Underground LRT Alternative – Little Tokyo Variation 2

7.6.1 NEPA Findings

Impacts related to growth-inducement would be similar to those under the Fully Underground LRT Alternative – Little Tokyo Variation 1. No direct or indirect growth-inducing impacts are expected with the exception of potentially accelerating currently anticipated growth near the eastern end of the alignment. This potential indirect effect would be less than significant.

7.6.2 CEQA Determinations

Impacts related to growth-inducement would be similar to those under the Fully Underground LRT Alternative – Little Tokyo Variation 1. No direct or indirect growth-inducing impacts are expected with the exception of potentially accelerating currently anticipated growth near the eastern end of the alignment. This potential indirect effect would be less than significant.

1.0 INTRODUCTION

This report describes the purpose and need for transportation investments in the Regional Connector Transit Corridor project area. The project area is located at the crossroads of the region's transportation system. However, there is currently a gap in the light rail system in downtown Los Angeles between the 7th Street/Metro Center Station and Union Station that forces riders to make transfers to reach many destinations.

1.1 Purpose of the Project

The purpose of this project is to improve the region's public transit service and mobility by connecting the light rail service of the Metro Gold Line to the Metro Blue Line and the Metro Expo Line. This link would serve communities across the region, allowing greater accessibility while serving population and employment growth in downtown Los Angeles.

The Regional Connector is a transit project planned by the Los Angeles County Metropolitan Transportation Authority (Metro) with the goal of improving travel times, reducing transfers, reducing traffic congestion, improving air quality, and creating a sustainable light rail transit system that serves people throughout the region as well as in downtown Los Angeles. The vision is to connect the spokes of the regional system and provide a "one seat ride" from Long Beach to Azusa and from East Los Angeles and the San Gabriel Valley to Santa Monica.

There are currently no direct trains for Metro Blue Line light rail passengers from Long Beach travelling to the Metro Gold Line to Pasadena or East Los Angeles. These passengers must transfer to the Metro Red or Purple Lines for travel between 7th Street/Metro Center Station and Union Station. At Union Station, passengers must transfer again, moving to platforms on different levels, to reach the Metro Gold Line. When the Metro Expo Line from Culver City to the 7th Street/Metro Center Station opens in 2011 its riders will also need to transfer at 7th Street/Metro Center Station to reach the Gold Line.

The Regional Connector would extend the shared Metro Blue/Expo Line tracks from their present terminus at 7th Street/Metro Center Station to a junction with the Metro Gold Line near the Little Tokyo/Arts District Station with continuing service to Union Station, Pasadena, East Los Angeles, and beyond. This would provide a one-seat ride for Metro Blue Line passengers travelling from Long Beach to Pasadena. Metro Expo Line passengers would also be able to ride from Washington/National Station in Culver City to East Los Angeles without transferring.

The Regional Connector would also provide increased transit coverage of the downtown area with new stations serving the Civic Center, Bunker Hill, Historic Core, Little Tokyo, and Financial Core along its route from 7th Street/Metro Center Station to the Metro Gold Line.

See Figure 1-1 for a map of the project area and Figure 1-2 for an overview map of the Metro Rail system, including projects currently under construction.

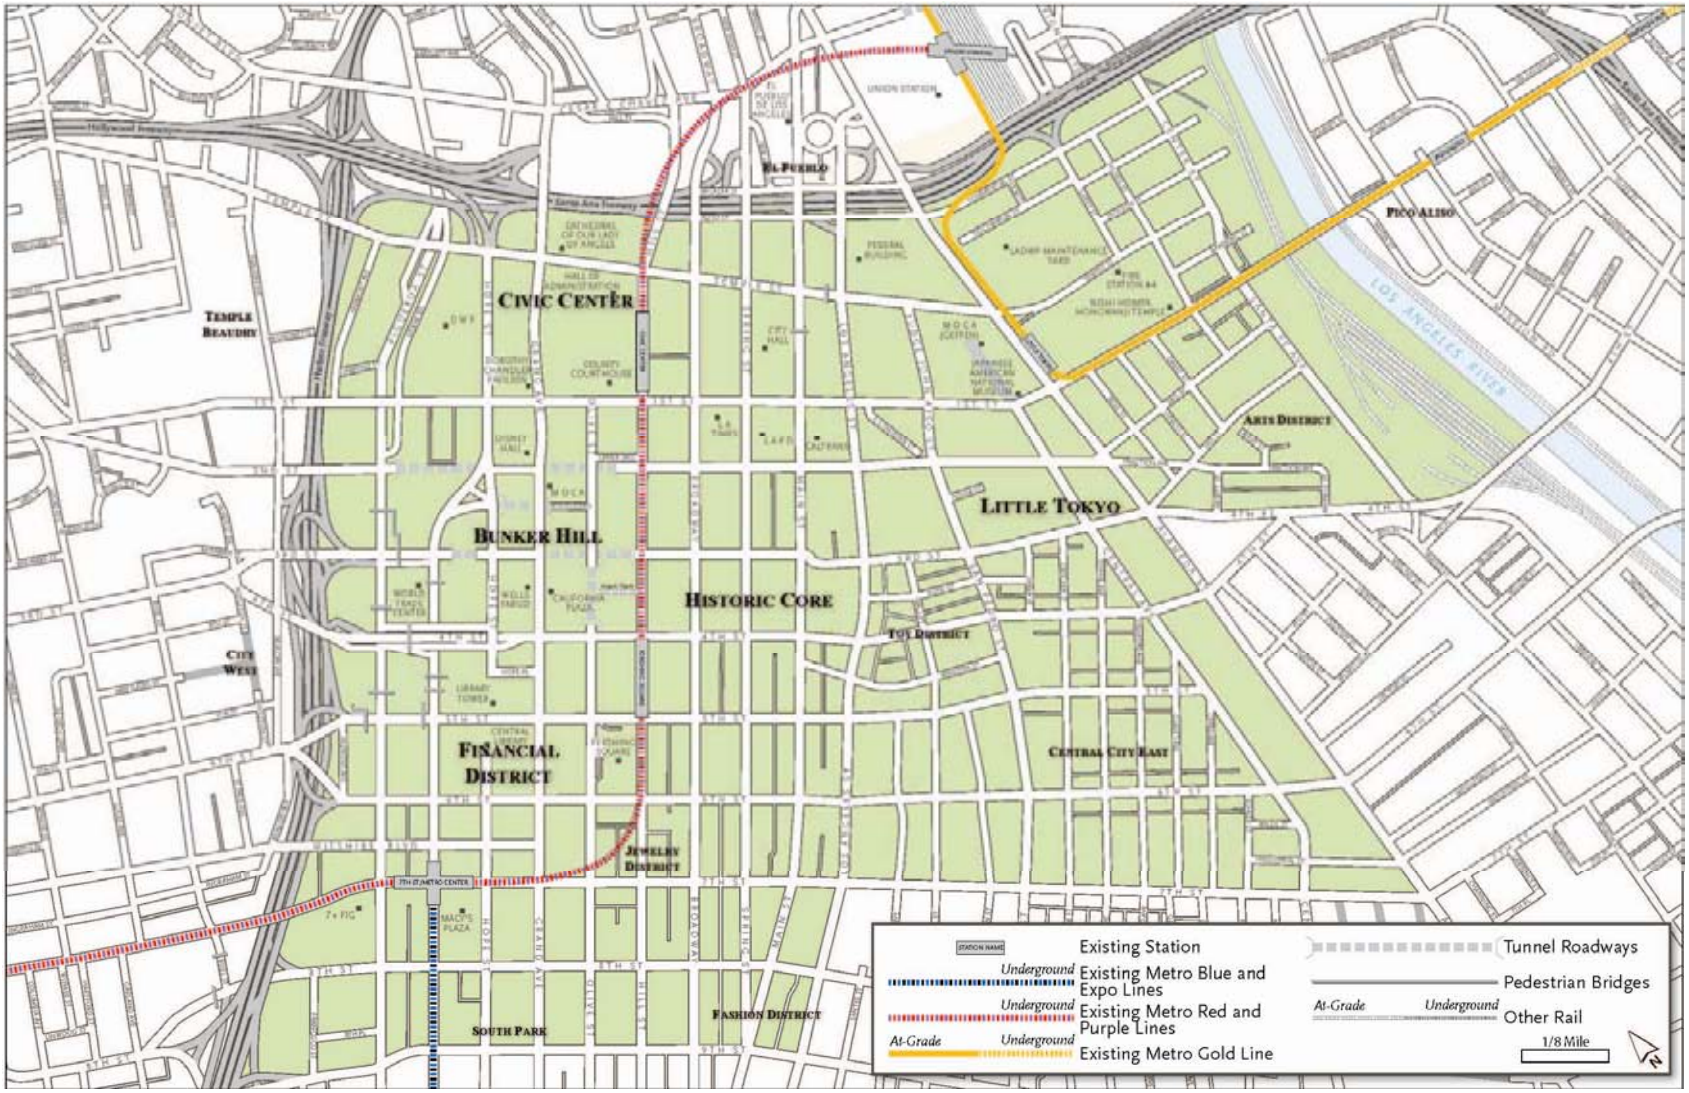

Figure 1-1. Project Area

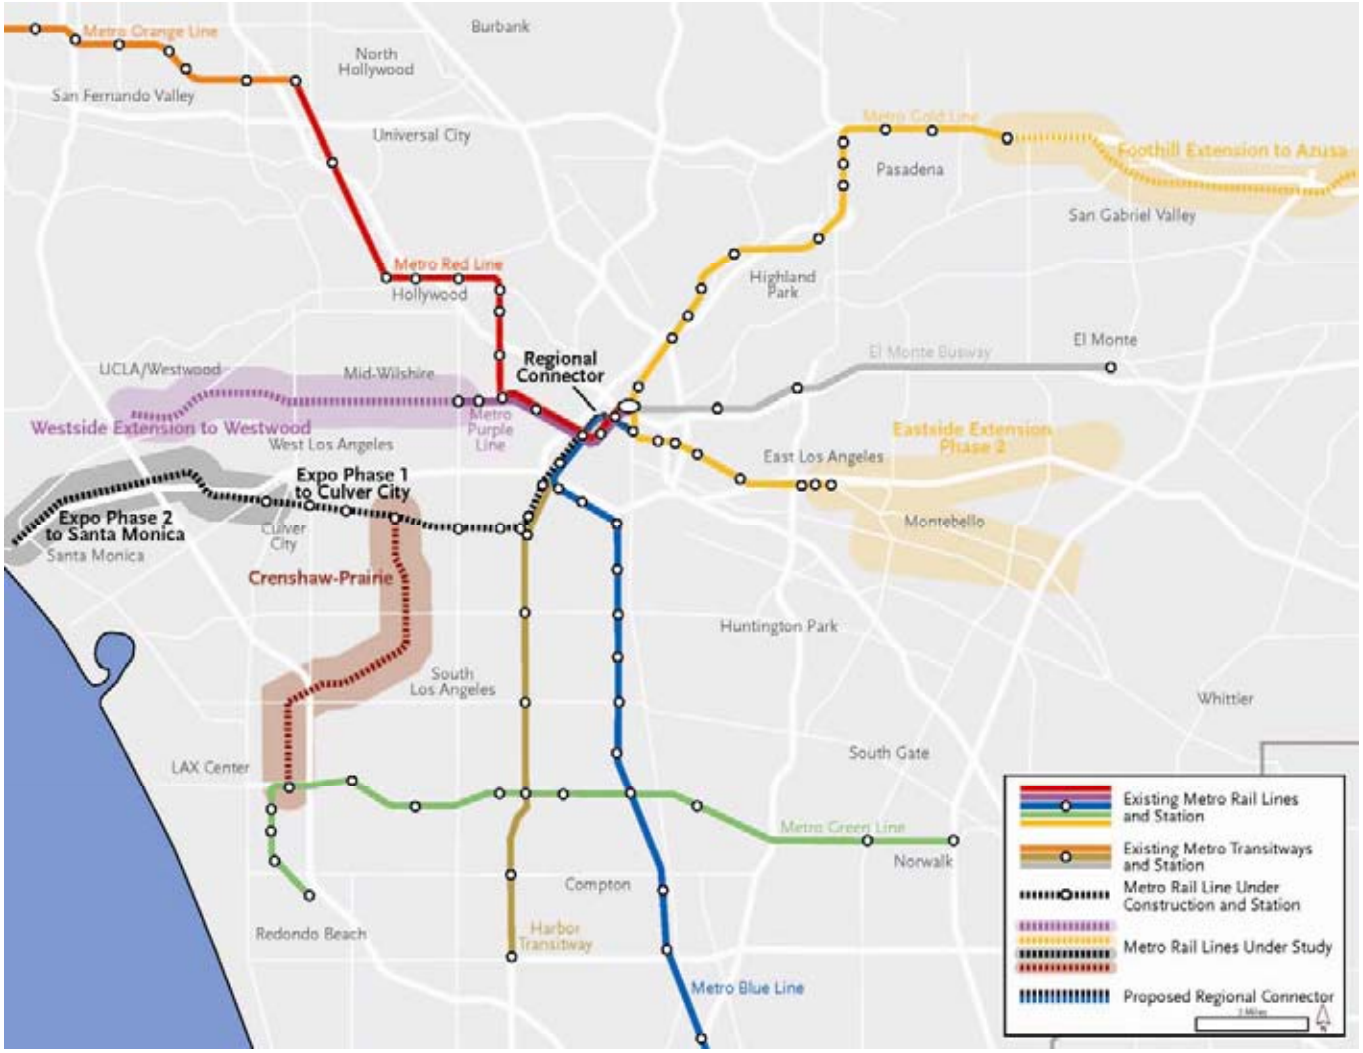

Figure 1-2. Regional Metro Rail Lines (2035)

2.0 BACKGROUND

2.1 Location

The project area is located in downtown Los Angeles. It is bounded on the west by State Route (SR) 110 (Harbor Freeway); on the north by US 101 (Hollywood Freeway); on the south by 7th and 9th Streets; and on the east by Alameda Street between 7th and 4th Streets and the Los Angeles River between 4th Street and US 101.

The project area is the largest regional employment center in Los Angeles County, and is densely developed with multi-family residences, industrial and public lands, commercial and retail establishments, government office buildings, and high-rise office towers. The corridor crosses several distinct community areas including the dense urban core of the Financial District; the residential high rises and regional entertainment centers of Bunker Hill; the Civic Center with a concentration of federal, state, and local government offices; residential and retail uses located in the historic structures of the Historic Core; and the culturally unique, mixed uses of Little Tokyo.

Given the density of employment within the project area, downtown Los Angeles has the highest concentration of transit service of any area in the County. Regional bus and commuter rail operators have routes that service the project area during peak hours from Los Angeles, Orange, San Bernardino, and Ventura Counties. Both Metro and the Los Angeles Department of Transportation (LADOT) operate local bus service throughout the day.

The southwest portion of the project area at the 7th Street/Metro Center Station is served by the Metro Blue Line to Long Beach and the Metro Expo Line to Culver City. The eastern edge of the project area (Union Station and the Little Tokyo/Art District Station) is served by the Metro Gold Line which currently connects Pasadena to East Los Angeles. These regional lines are connected by a variety of bus lines and the short east-west Metro Red Line but multiple transfers are required for longer north-south or east-west trips through the project area.

Due to its central location at the heart of the regional transit system, investments in the Regional Connector Transit Corridor project area have the potential to affect schedule reliability of the entire system. As the Metro Expo Line and Metro Gold Line to East Los Angeles are completed, this lack of regional connectivity will become even more apparent.

2.2 History

Rail transit in Los Angeles dates to 1872, when Southern Pacific began construction on a passenger rail line from downtown to San Pedro, with the intent of eventually monopolizing the regional transportation system. By the 1920s, the Southern Pacific and Pacific Electric systems had nearly 800 cars in service and hundreds of miles of tracks. Los Angeles Railway also operated a local streetcar system serving the downtown core and the nearby

neighborhoods, which carried the bulk of Los Angeles' urban ridership. Notable busy lines included the Aiso Street service to Boyle Heights, the Temple and 2nd Street cable cars on Bunker Hill, and the Angels Flight funicular railway. Pacific Electric's Hollywood, Glendale, and San Fernando Valley trains entered the one-quarter-mile long Belmont Tunnel at the tail end of their trips to the Subway Terminal Building at 4th and Hill Streets in downtown Los Angeles.

Despite the extensive track and power infrastructure, Los Angeles' rail transportation system would last only four more decades. Americans traded streetcars for private automobiles with record speed and moved to neighborhoods beyond the railroads' reach. Rail transit's final zenith came during World War II, when fuel, metal, and rubber rationing briefly forced millions of Americans back onto streetcars to get to their jobs.

With the end of the war came a period of economic and industrial prosperity and the pent-up demand for new automobiles could finally be met. With few rail riders remaining and new diesel bus technology offering a cheap substitute for streetcar service, cash-strapped transit operators nationwide began canceling routes and removing tracks. The Los Angeles system closed entirely, with the last train making its trip from downtown to Long Beach in 1963.

Freed by the heightened mobility that private cars offered, people began working in increasingly suburbanized settings, and the old downtown core plunged into decline for several decades. In recent years, with traffic congestion mounting, the mobility that supported geographically-dispersed job and housing patterns has become increasingly constrained. Longer commute times, ever-climbing gas prices and increased concern about vehicle greenhouse gas emissions leading to climate change have prompted many Los Angeles residents to seek a return to the transit-friendly urban form of decades past. Downtown Los Angeles has seen a recent surge in development and many residents are rediscovering the forgotten urban core.

During the mid-1980s, the Los Angeles County Transportation Commission and Southern California Rapid Transit District began piecing together the railroad rights-of-way abandoned decades earlier with the intent of bringing rail transit back to Los Angeles.

Today, the Metro Rail system consists of over 79 track miles and downtown Los Angeles is once again served by a radial network of rail transit lines. The Metro Red Line has assisted in the resurgence of the downtown area, including the project area, by improving accessibility and facilitating movement between various districts.

In addition, the Southern California Regional Rail Authority has gradually purchased its own right-of-way and developed a 512-mile commuter rail system over the course of the past two decades, linking commuters throughout the region to their downtown jobs.

2.3 Past Studies

Early studies from 1988 to 1993 focused on extending the light rail line from Long Beach to Los Angeles (Metro Blue Line) through downtown to Pasadena. A light rail line from downtown west to Santa Monica (Metro Expo Line) was not yet planned at the time and the light rail Metro Gold Line Eastside Extension was first fully approved as an extension of the Metro Red Line, a heavy rail subway system that was re-scoped to the currently operating Metro Gold Line Eastside Extension light rail system. Therefore these earlier studies did not account for the benefits of a cross-county east-west light rail service, and instead focus on the north-south route from Long Beach to Pasadena. The Regional Connector, however, would provide the benefits of both routes. The later studies from 2004 onward, including the recent Alternatives Analysis (AA) (Appendix H), focus on both the north-south and east-west routes, as described in the following subsections.

2.3.1 Pasadena – Los Angeles Light Rail Transit Project EIR

After the study was completed in 1993, the Board of Directors delayed the pursuit of the segment between 7th Street/Metro Center Station and Union Station due to funding constraints. The Pasadena-Los Angeles Light Rail Transit Project, now the Metro Gold Line, was constructed and began operations in 2003. The Metro Gold line ran from the Sierra Madre Villa Station in Pasadena to Union Station until an extension to East Los Angeles opened in 2009 allowing for continued operations between Pasadena, Union Station and East Los Angeles. As an interim solution for not having a direct light rail connection between the Long Beach and Pasadena lines, passengers must transfer to the Metro Red and Purple Lines to travel from Union Station to 7th Street/Metro Center.

It was specifically indicated in the study that a direct light rail connection is possible between Union Station and 7th Street/Metro Center Station to reduce transfers between the Metro Red, Purple, Gold and Blue Lines.

2.3.2 Blue Line Connection Preliminary Planning Study

In 1993, Metro completed a preliminary planning study to analyze alternatives for connecting the Long Beach Blue Line, already in operation, to the Pasadena Blue Line (now the Metro Gold Line), which was not yet under construction at that time. Although the Metro Gold Line provides a viable service as stand-alone transit from downtown Los Angeles to Pasadena, a potential capacity problem for the Metro Red Line was identified, as it was the sole rail connection between Union Station and the 7th Street/Metro Center Station. Metro officials recognized that building a connection between the Long Beach and Pasadena light rail lines would alleviate the capacity issues, and increase the overall usefulness of the system.

2.3.3 Los Angeles Eastside Corridor Final Supplemental EIR/EIS

At the time of the Blue Line Connection Preliminary Planning Study, an extension of the Metro Red Line to Boyle Heights was also being considered. The preferred alternative was a 3.1-mile long heavy rail transit (HRT) subway with four stations. After funding concerns in the mid-late 90's, all planned corridor projects were halted and re-evaluated in 1998.

In February 2002, Metro approved the Metro Gold Line Eastside Extension, using LRT in lieu of the previously identified HRT Metro Red Line Eastside Extension. The extension opened for revenue service in November 2009 with twice as many stations and twice a long as the original planned project. Running from Union Station to the Atlantic Station in East Los Angeles, this six-mile, eight-station extension traverses Alameda Street, 1st Street, Indiana Street, and 3rd Street. A new bridge connects Union Station to the eastern edge of downtown in Little Tokyo by crossing south over the US 101 freeway to the intersection of Alameda and Temple Streets. The route runs at grade on the eastern side of Alameda Street from Temple Street to 1st Street. An at-grade station at 1st and Alameda Streets (Little Tokyo/Arts District Station) is located at the northeast corner of the intersection.

This project reaches the eastern edge of the project area, but does not complete the gap across downtown Los Angeles to the transit lines that extend south and west.

2.3.4 Mid-City/Exposition Transit Corridor EIS/EIR

Also part of the re-scoping of projects, the Metro Expo Line was identified as a new light rail transit system providing service from Santa Monica to a shared terminus with the Metro Blue Line at 7th Street/Metro Center Station in downtown Los Angeles. The project was approved in 2005. A first phase from downtown Los Angeles to Culver City is currently under construction. A second phase extending to Santa Monica was approved in early 2010 and is expected to be in operation by 2015. This project reaches the southern edge of the project area and will bring additional transit riders to downtown, but it does not complete the gap across the project area to Union Station.

2.3.5 Regional Light Rail Connector Study

Based on new alignment opportunities created by the approval and construction of the Metro Gold Line Eastside Extension and the under construction Metro Expo Line, Metro completed an engineering feasibility study in 2004 to identify potential alignment, station and configuration alternatives for a new light rail transit (LRT) connection between the Metro Blue, Expo and Gold Lines. The new alternatives connected the Metro Gold Line in the vicinity of the Little Tokyo/Arts District Station at 1st and Alameda Streets to the 7th Street/Metro Center Station.

Forty-one initial alternatives were developed and initial screening reduced the number of alternatives to 16. The screening was based on alignment characteristics, service area, cost,

complexity of engineering, and other similar criteria. No public input process was performed, and no preferred alternative was identified in this study.

2.3.6 Regional Connector Transit Corridor Alternatives Analysis Report

Building on the findings of the Regional Light Rail Connector Study, the Alternatives Analysis (AA) Report, initiated in June 2007 and completed in January 2009 identified 36 conceptual alternatives for study. Initial environmental analysis, engineering, and public outreach activities including an FTA Early Scoping notice, were performed to assist preliminary study of the alternatives. The screening processes during the AA study produced two final recommended build alternatives, along with a No Build Alternative and TSM Alternative, which were subsequently carried into the EIS/EIR scoping process. The full AA Report is incorporated into this Draft EIS/EIR as Appendix H.

2.3.7 Adoption of the Regional Connector Transit Corridor Project

The Regional Connector Transit Corridor project was authorized by the Metro Board of Directors to proceed into the Draft EIS/EIR phase in February 2009. Regional plans and funding measures that identify the Regional Connector include the Southern California Association of Governments (SCAG) Regional Transportation Plan, the Metro Long Range Transportation Plan, and Measure R.

2.3.7.1 SCAG Regional Transportation Plan

SCAG's *2008 Regional Transportation Plan* includes the Regional Connector as a strategic transit system expansion project with implementation expected prior to 2035. As the designated Metropolitan Planning Organization (MPO) for Los Angeles, Riverside, San Bernardino, Ventura, Orange, and Imperial Counties, SCAG provides coordination between transit projects across the Southern California region.

2.3.7.2 Metro Long Range Transportation Plan

Metro's *2009 Long Range Transportation Plan* includes the Regional Connector among the projects planned for implementation by 2035 (possible opening date of 2019). The other projects outlined in the plan are also included in the baseline year 2035 conditions assumed for the regional transportation analysis presented in this Draft EIS/EIR.

2.3.7.3 Measure R

In November 2008, Los Angeles County voters approved a half-cent sales tax (Measure R) that will be used to fund approximately $40 billion worth of transportation projects in Los Angeles County over the next 30 years. Due to the uncertainty of the passage of Measure R during the development of the AA, projects identified in Measure R were not included in the AA Report, as they had not yet been identified as funded in the *Long Range Transportation Plan*. With the passing of Measure R, identified funded projects to be completed and operational by 2035

are incorporated in the analysis conducted for this Draft EIS/EIR, as part of the No Build Alternative.

3.0 PROJECT AREA DEMOGRAPHICS

3.1 Data Sources and Methodology

Demographics in the project area were examined to establish a baseline for assessing the potential benefits of adding improved transit service. Data presented in this section were obtained from the Southern California Association of Governments (SCAG, 2009) and the U.S. Census Bureau (2000). Data are representative of demographic conditions at the time of data-gathering and are used as the basis of evaluation in the Draft EIS/EIR.

The project area is currently undergoing significant changes in terms of housing and demographics. Within the last five years, new market-rate condominium towers have been completed, historic buildings have been converted to loft housing, and new entertainment centers have been approved for construction, bringing renewed interest to downtown. These activities continue to bring about demographic changes that may not be reflected in data from 2005 or earlier.

Some data was not available or not relevant for certain portions of the project area, so field reconnaissance was substituted for the missing data. The project area encompasses portions of several census tracts requiring block-level data to get an accurate representation of each neighborhood. Some tracts are relatively homogeneous which allows data for the whole tract to represent the portions. Other tracts have different characteristics throughout, and attempting to represent one neighborhood with data from the entire tract would be inaccurate. For this characterization of the project area it is more meaningful to show that available census data is not applicable and substitute field reconnaissance rather than inaccurately represent portions of the project area.

For these reasons, the data presented here may be slightly different than the data presented in the Environmental Justice and the Community and Neighborhoods Technical Memoranda.

3.2 Population and Employment

The Regional Connector project area covers 2 square miles, or 0.04 percent of the 4,752 square miles of the County. The total residential population of the project area is 19,396, or 0.19 percent of the total County population. The average population density within the project area is 9,968 per square mile, 3.76 times that of the County.

Despite its small size and residential population, the Regional Connector project area offers 3.82 percent of the County's total employment of 171,750 jobs. Employment density in the project area is 85,875 employees per square mile which is more than 85 times the County-wide employment density.

Table 3-1 summarizes the project area and County population and employment information for 2008. Population and employment growth are discussed further with respect to transit dependency in Section 3-4.

Table 3-1. Population and Employment

Demographics	Project Area	L.A. County	Percent of County
Population	19,396	10,449,838	0.19%
Population Density (people/sq. mi.)	9,698	2,573	NA
Total Employment	171,750	4,498,598	3.82%
Employment Density (jobs/sq. mi.)	85,875	1,108	NA

Source: SCAG, 2008

3.3 Project Area Ethnicity

According to the most recent Census data, the project area has higher proportions of Asian and African-American residents than the County. African-American residents compose 28.5 percent of the population of the project area, compared with 9.6 percent of the County; they reside in the project area primarily east of Hill Street and south of 1st Street.

Asian residents, who live primarily between 1st Street and 5th Street, compose 23.8 percent of the project area, compared with 11.9 percent of the County.

According to the most recent census data, the project area has significantly lower compositions of White and Hispanic populations when compared to the County.

Table 3-2 shows the racial and ethnic breakdown of the project area. Figures 3-1 through 3-6 illustrate the population's racial and ethnic distribution throughout the project area.

3.4 Transit Dependency

Transit dependent populations are those groups that rely on public transit to meet their mobility and access needs to a greater degree than the general population. Within the project area, transit dependent populations include low income households, seniors, and zero car households

Table 3-2. Racial and Ethnic Composition				
Demographics	Project Area		Total LA County	
	Number	%	Number	%
Race				
Total Population	19,396	100%	9,519,338	100%
White	5,564	28.7%	4,622,759	48.6%
Black/African American	5,534	28.5%	916,907	9.6%
American Indian	206	1.1%	68,471	0.7%
Asian	4,612	23.8%	1,134,263	11.9%
Pacific Islander/Hawaiian	40	0.2%	27,221	0.3%
Some other race	2,433	12.5%	2,262,925	23.8%
Two or more races	1,007	5.2%	486,792	5.1%
Ethnicity				
Total Population of Project Area	19,396	100%	9,519,338	100%
Hispanic or Latino (regardless of race)	4,700	24.2%	4,242,213	44.6%

Source: U.S. Census Bureau, Summary File 3, 2000; SCAG 2008

Residents in the project area are categorized within the US Census Data as either below or above the poverty level. In 2000, there were 3,575 households in the project area below the poverty level. Income projections to 2035 for the project area are currently unavailable.

Based on the 2000 data, 38% of the households in the project area are below the poverty level.

Table 3-3. Project Area Income Status		
Demographics	Project Area	Percent (%)
Total Households	9,648	100
Households Below Poverty Level	3,575	38.2

U.S. Census Bureau, Table P92, 2000

According to data presented in Table 3-4, only 6.1 percent of the population in the project area is age 18 or younger, compared to 29.4 percent of the population of the County. The project area also has a higher percentage of elderly residents (19.6 percent) compared to the County (9.7 percent).

Table 3-4. Population Age				
Age	Project Area	Percent (%)	L.A. County	Percent (%)
18 and under	1,188	6.1	2,798,604	29.4%
65 and over	3,795	19.6	926,670	9.7%

Source: U.S. Census Bureau, Summary File 3, 2000; SCAG, 2005

The young and the elderly have a higher propensity for using public transportation, since these groups are less likely to have driver's licenses or access to private automobiles.

Project area residents use transit more than people in other areas of the County. Eleven percent of the households (or 1,121 households) with people age 16 and older who both live and work in the project area commute via public transportation, compared to seven percent of the entire County.

Figure 3-7 shows the distribution of public transportation users within the project area. They tend to live in areas where there are high percentages of zero-vehicle households, as shown in Figure 3-8. A much higher proportion of households in the project area lack vehicle access (67 percent) than in the County as a whole (12 percent).

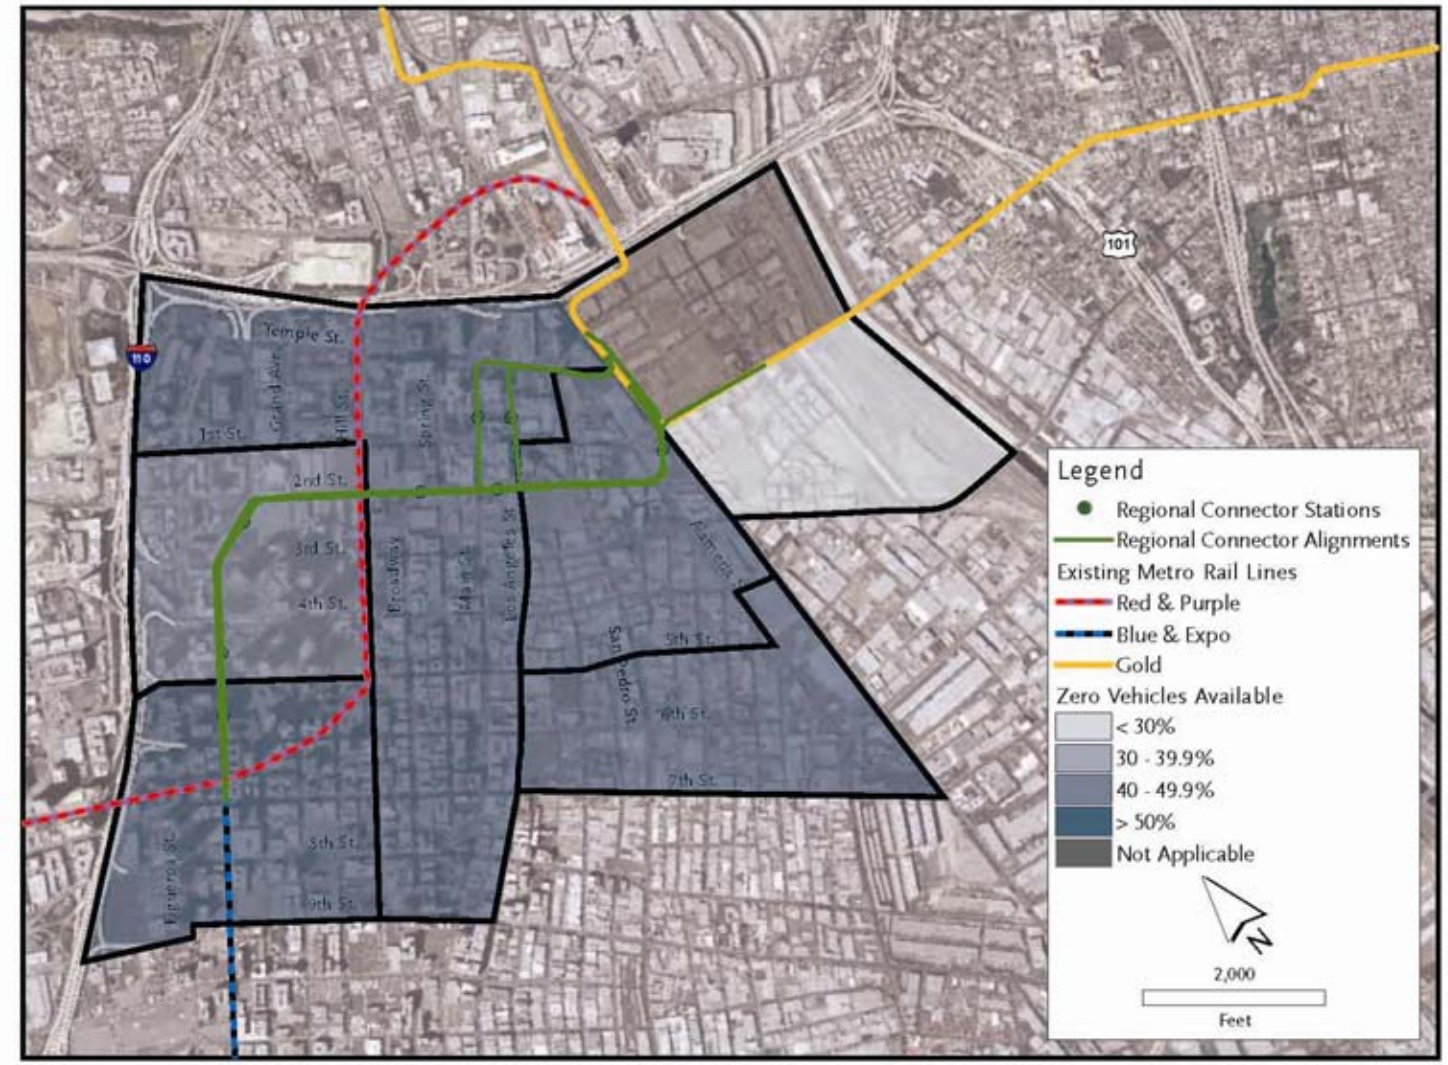

Figure 3-8. Households with No Available Car in Project Area

4.0 PUBLIC TRANSPORTATION FACILITIES AND SERVICES

4.1 Project Area Public Transit Context

Downtown has the highest concentration of transit service of any area in the County. At present, ten transit operators provide service along 110 bus routes and four Metro Rail lines within the project area, as illustrated in Figure 4-1. There is also heavy pedestrian activity throughout the project area. The bus and rail lines branch out in all directions from the project area to many destinations in Los Angeles County. Freeway express service also allows riders to reach destinations in Orange, San Bernardino, and Ventura Counties during peak commute hours.

4.2 Transportation Facilities and Services in the Project Area

4.2.1 Metro Rail

Metro provides rail service to the project area with the Metro Red Line from Union Station to North Hollywood, the Metro Purple Line from Union Station to Wilshire Center, the Metro Blue Line from the 7th Street/Metro Center Station to Long Beach, and the Metro Gold Line from East Los Angeles to Pasadena. The rail service consists of 70 rail stations and over 79 track miles.

Service has recently been extended to East Los Angeles through the opening of the Metro Gold Line to East Los Angeles and will be extended to Culver City in 2011 via the Metro Expo Line that is currently under construction. All Metro Rail stations provide connections to additional public transportation options, including Metrolink and Amtrak commuter rail services and bus service provided by Metro and other transit operators. Table 4-1 summarizes existing and future Metro Rail Lines currently under construction in the project area.

Figure 4-1. Metro Service Map for Downtown Los Angeles

Table 4-1. Existing and Future Metro Rail Lines in the Project Area

Line	Mode	Route	Length	Weekday Ridership	Year Completed
Existing Metro Rail Lines					
Red/Purple	HRT	Union Station to North Hollywood, Wilshire/Western	17.4 Miles	139,409	1993-2000
Blue	LRT	7th Street/Metro Center to Long Beach	22 Miles	70,583	1990-1991
Gold	LRT	Sierra Madre Villa to East Los Angeles	19.7 Miles	28,227	2003, 2009 (Eastside Extension)
Future Metro Rail Lines (under construction)					
Expo	LRT	7th Street/Metro Center to Culver City	8.6	27,000	2011

[1] Source of anticipated weekday ridership: BuildExpo.org for projection year 2020

Metro Red Line – This heavy rail transit (HRT) subway line originates from Union Station and travels west (Figure 4-2). The line began operating with service between Union Station and Westlake/MacArthur Park station (5 stations) in 1993. An extension to Wilshire/Western station, which was later renamed the "Metro Purple Line," was completed in 1996. The extension of the Metro Red Line northwest from Wilshire/Vermont station to Hollywood/Vine station with an additional 5 stations opened in 1999. Three more stations were added with the opening of the extension to North Hollywood in 2000.

Figure 4-2. Metro Red Line

Metro Purple Line – This HRT line originated when the Union Station-Wilshire/Western route of the Metro Red Line was renamed the Metro Purple Line in 2006. Service began on this

route in two phases, in 1993 and 1996. As of the 2009 fiscal year, the Red and Purple Lines experienced approximately 139,409 weekday boardings on 17.4 miles of track.

Metro Blue Line – This line opened in 1990 and was the first light rail transit (LRT) system in Los Angeles since the previous rail transit system closed in the 1960s. The 22-mile line has 22 stations and runs from 7th Street/ Metro Center Station south to Long Beach. The Blue Line averaged 70,583 weekday boardings in the 2009 fiscal year.

Metro Gold Line – This LRT line from East Los Angeles to Pasadena has 21 stations, approximately 20 miles of track, and began operating in 2003 from Union Station to Pasadena. In the 2009 fiscal year, the line averaged 28,227 weekday boardings. The Metro Gold Line to East Los Angeles opened in late 2009, making stops in Little Tokyo, Boyle Heights, and East Los Angeles. The six-mile extension features eight new stations and connects with the existing Metro Gold Line to Pasadena without requiring riders to transfer at Union Station. Metro estimates that there will be 23,000 riders each weekday on the Metro Gold Line to East Los Angeles by 2020.

Figure 4-3. Metro Gold Line

Metro Expo Line – The first phase of the Exposition LRT line is expected to open in 2011. The 8.5-mile line will run primarily at grade and serve 11 stations from 7th Street/Metro Center Station in downtown to the intersection of Washington Blvd. and National Blvd. in Culver City. Average weekday ridership is expected to reach 43,600 by 2020 (Metro 2005). A second phase of the Expo Line to Santa Monica is currently in the planning phases.

There are four Metro Rail stations located within the project area. The HRT Metro Red and Purple Line stations are Civic Center Station (Hill Street between Temple and 1st Streets), Pershing Square Station (Hill Street between 4th and 5th Streets), and 7th Street/Metro Center Station (7th Street between Figueroa and Hope Streets, and Flower Street between Wilshire Blvd. and 8th Street). The 7th Street/Metro Center Station serves as a transfer point to the LRT Metro Blue Line as well. The LRT Little Tokyo/Arts District Station (Alameda Street between Temple and 1st Streets) is the newest station that opened in late 2009 as part of the Metro Gold Line to East Los Angeles.

4.2.2 Bus Service

Since downtown Los Angeles is a regional employment hub, there are numerous bus operators serving the area. These operators include:

- Antelope Valley Transit Authority (AVTA)
- City of Gardena (Gardena Municipal Bus Lines)
- City of Santa Clarita Transit
- City of Santa Monica (Big Blue Bus)
- Foothill Transit
- City of Los Angeles Department of Transportation (LADOT)
- Los Angeles County Metropolitan Transportation Authority (Metro)
- City of Montebello (Montebello Bus Lines)
- Orange County Transportation Authority (OCTA)
- City of Torrance (Torrance Transit)

Figure 4-4. Metro Bus

With the exception of Metro, LADOT, Montebello Bus Lines, City of Santa Monica, and Gardena Municipal Bus Lines, these transit operators run mostly peak commute (rush) hour, peak-direction commuter bus service in and out of the project area. LADOT provides both long-distance freeway commute service as well as frequent Downtown Area Short Hop (DASH) service along short, mostly circular shuttle routes within the downtown area. In addition to public transit services, several high-rise office building landlords within the project area offer shuttle bus service to Union Station for their tenants.

The majority of bus transit service in the project area, as well as the Los Angeles region, is provided by Metro, which operates a number of short and long-distance radial lines, as well as cross-town service, express service, and limited overnight service. The combined number of transit vehicle boardings and alightings in the project area on Metro buses alone totals 174,000 on a typical weekday. The 86,000 weekday boardings account for 15.2 percent of the 569,046 bus boardings system-wide.

Metro's bus transit services vary considerably in speed and capacity. The most basic routes provide line-haul service to and from downtown along arterial streets. Heavily-traveled routes often have overlaid limited-stop or Metro Rapid bus service.

Metro Rapid bus service includes traffic signal priority, short headways, and limited stops, which increase corridor average bus speeds by about 3-4 mph compared to local service, which typically operates in the 9-12 mph range. Metro currently provides Rapid service into the Regional Connector project area from major intersections along busy routes, including Beverly Blvd. (during peak hours only), Wilshire Blvd., Whittier Blvd., South Broadway, Hawthorne Blvd, Pico Blvd., and Central Avenue, Long Beach Blvd, Garvey Avenue, Cesar Chavez Avenue, and San Fernando Rd.

The majority of the publicly-provided commuter services originating east of downtown use the El Monte Busway. Constructed in 1976, these high capacity bus-carpool lanes parallel the San Bernardino Freeway (I-10) between the City of El Monte and downtown. Similarly, the commuter buses coming from points south and southeast of downtown primarily use the Harbor Transitway, completed in 1996, which runs along the median of SR-110 between Artesia Blvd. and Adams Blvd. Several transit operators use these facilities, and Metro also operates the Silver Line service, which runs on both facilities.

Busway stations are located in freeway medians which are uninviting to pedestrians and usually not immediately adjacent to activity centers. The busway stations are convenient to commuters who arrive on feeder bus lines or use adjacent park and ride lots. However, light rail stations are usually better situated to enhance neighborhood activity.

4.2.3 Commuter Rail

Commuter rail service to downtown is provided primarily by Metrolink and Amtrak, with connections to Metro Rail service at Union Station, located one-tenth-mile outside of the project area. Most passengers arriving at Union Station on Metrolink are bound for the central business district and presently use the Metro Red Line, DASH buses, or employer-provided shuttles to complete their trips. Some passengers may use the Regional Connector if it reduces trip times or transfers.

Metrolink has operated under the Southern California Regional Rail Authority (SCRRA) since 1992, serving the counties of Los Angeles, Orange, Riverside, San Bernardino, San Diego, and Ventura. Metrolink provides 512 miles of service (including tracks shared with Amtrak) to 55 stations on seven routes. Average weekday ridership on Metrolink trains from October through December 2009 was over 40,000 daily boardings, with the majority of trips (57.5 percent) beginning or ending at Union Station.

Amtrak is an inter-city rail system providing passengers at Union Station with regional, statewide, and nationwide service.

4.3 Performance of the Travel System

Southern California is faced with multiple mobility challenges that hinder the region's ability to effectively meet additional travel demand. One of the most pressing issues is population growth. The County alone is expected to increase by 2.3 million people, nearly twice the population of the City of San Diego, to a total of 12.3 million people by 2035. This expected population growth will lead to increased travel demand throughout the region.

The transportation network includes 9,000 lane-miles of freeway, more than 42,000 lane-miles of arterials, and several large public transit service providers (SCAG 2008). Yet growth of the transportation system has not kept pace with population growth and increases in transportation demand. As the population in the region doubled from 1960 to 2000, highway miles increased by less than 30 percent (SCAG 2008). The congestion caused by insufficient transportation lanes affects both personal travel and goods movement. The majority of the congestion is from travel on the highways and local arterial network regardless of transportation mode. If the current trend persists, travel delays are expected to rise to 5.7 million person hours by 2035, more than double currently experienced delays, which will deeply affect highway productivity (SCAG 2008).

If inadequately addressed, these challenges could hamper future population growth, economic development, commuter safety, existing infrastructure, goods movement, air quality, and other environmental conditions. If no action is taken to improve transportation mobility, SCAG estimates that daily person hours of delay would increase from 2.2 million hours under the 2000 Base Year to 5.7 million hours under the 2035 Baseline.

To define and address mobility issues, SCAG developed regional performance indicators that help in understanding the problem, setting goals for improvement, and measuring progress towards the goals. The following section describes regional performance indicators and baseline estimates of performance. By providing more attractive alternatives to the automobile, improving transit connections to and through the downtown Los Angeles area becomes one part of a larger, comprehensive strategy to meet regional travel demand.

4.3.1 Traffic Volumes and Operating Conditions

Performance of intersections is measured by "level of service" (LOS) (Table 4-2). All of the key intersections currently operate at LOS D or better during both the AM and PM peak hours. Only the Figueroa Street and Wilshire Boulevard intersection is operating at LOS F in the PM peak hour (Figure 4-5). By 2035, up to 28 intersections in the project area will be at LOS E or F in the PM peak hour without transit improvements in the project area (Figure 4-6).

Freeways within the project area already operate at LOS F during peak hours and, if not addressed, this trend is expected to worsen through the year 2035. Nearly all areas of the County experience freeway congestion during peak hours. However, the congestion on

freeways within the project area is among the worst and occurs during both the morning and evening rush hour periods, as illustrated in Figure 4-7.

In addition to congestion at intersections and on the freeways, many of the key roadway segments are also projected to operate at LOS D or worse in 2035 in the absence of transit improvements in the project area. In particular, most of the segments along Alameda and 3rd Street are projected to be at LOS F.

For a complete description of the traffic operating conditions analysis, see the Transportation Technical Memorandum (Appendix L).

Table 4-2. Level of Service Definitions

Level of Service	Volume/Capacity Ratio	Definition
A	0.000 - 0.600	FREE FLOW. No vehicle waits longer than one red light and no green light phase is fully used.
B	0.601 - 0.700	REASONABLY FREE FLOW. An occasional approach phase is fully utilized; many drivers begin to feel somewhat restricted within groups of vehicles.
C	0.701 - 0.800	STABLE FLOW. Occasionally drivers may have to wait through more than one red light; backups may develop behind turning vehicles.
D	0.801 - 0.900	APPROACHING UNSTABLE FLOW (acceptable for urban conditions). Delays may be substantial during portions of the rush hours, but enough lower volume periods occur to permit clearing of developing lines, preventing excessive backups.
E	0.901 - 1.000	UNSTABLE FLOW (practical capacity). Represents the most vehicles intersection approaches can accommodate; may be long lines of waiting vehicles through several signal cycles.
F	>1.000	FORCED OR BREAKDOWN FLOW. Backups from nearby locations or on cross streets may restrict or prevent movement of vehicles out of the intersection approaches. There are tremendous delays with continuously increasing queue lengths.

Figure 4-7. Freeway Levels of Service

4.3.2 Transit Operating Conditions

Bus service runs in a grid pattern through the downtown area, with most lines terminating at the periphery after having passed through. Nearly all streets within the project area have bus service during peak hours.

On several routes, headways shrink to less than five minutes during rush hour, and some stops are served by over a dozen lines. Some of the most heavily transit-served streets in the project area are 1st Street, the 4th Street/5th Street couplet, Hill Street, Broadway, the Main Street/Spring Street couplet, and the Grand Street/Olive Street couplet. Downtown streets with the highest bus ridership include Broadway, Hill Street, Spring Street, Main Street, Flower Street, and Grand Avenue.

Of the numerous bus routes serving downtown, over 30 pass within one block of both Union Station and the 7th Street/Metro Center Station, the termini of the Regional Connector corridor. There are 51 bus lines, mostly operated by Metro, with over 174,000 daily passenger boardings and alightings within the project area. Table 4-3 shows the bus lines provided by each bus operator, and the frequency of available service for each bus route.

The four busiest Metro bus lines serving the downtown area all originate in West Los Angeles or Santa Monica. The Metro bus lines with the highest number of boardings within the project area serve areas east and south of downtown. This supports the Westside, the Eastside, and South Los Angeles as primary origins and destinations for current bus passengers traveling in and out of the project area. See Table 4-4 for a summary of Metro bus transit ridership by line and direction.

Of the 38 Metro bus lines that pass within a block of both Regional Connector termini (Union Station and 7th Street/Metro Center Station) only a small percentage of the total ridership on these lines boards within the project area. This could indicate that riders are reluctant to transfer between modes (Table 4-5).

Most of the lines paralleling the Regional Connector route (serving both Union Station and the 7th Street/Metro Center Station) originate from points east of downtown, and five of them use the El Monte Busway. Most of the lines function primarily as peak hour commuter buses. Compared to other Metro bus lines in the project area, these routes do not carry as many riders which may be attributable to their lack of off-peak service.

Metro operates 125 bus stops within the project area. The five busiest Metro bus stops, each with 3,400 - 6,300 daily boardings, are located along Hill Street and Broadway between 5th and 7th Streets (Table 4-6). All of these stops are within one-quarter mile of the existing Pershing Square Station. If the Regional Connector includes stations near Broadway, Hill, and Spring Streets, it will enable transfers between the LRT system and the busiest north-south bus corridors in the area.

Most of the other busy Metro bus stops in the project area are located in the Financial Core and Civic Center areas, both of which will be served by the Regional Connector. Additionally, other transit operators have bus stops within the project area, although their ridership data were not available at this level of detail for this Draft EIS/EIR.

4.3.3 Regional Objectives

SCAG is responsible for regional transportation planning for six counties within Southern California: Imperial, Los Angeles, Orange, Riverside, San Bernardino, and Ventura. In May of 2008, SCAG released its Regional Transportation Plan (RTP) entitled "Making the Connections." This document provides a basic policy and program framework to improve the transportation system and integrate it with the population growth patterns for the region through 2035.

Making the Connections is a performance-based plan with the following goals:

- Maximize mobility and accessibility,
- Ensure safety and reliability,
- Preserve our transportation system,
- Maximize productivity of our system,
- Protect the environment,

- Encourage land-use and growth patterns that complement our transportation system, and
- Maximize security through improved system monitoring, rapid recovery planning, and coordination with other agencies.

SCAG developed performance indicators and measures to quantify the goals and evaluate progress towards achieving the goals. Table 4-7 lists the performance indicators, associated measures, and final projected outcomes. The outcomes are estimated for the Plan as a whole for 2035, and not for individual projects.

If no action is taken, performance in the region will worsen. SCAG projects that between Base Year 2000 and 2035:

- Average travel speed will reduce by 12.5 percent from 31.0 miles per hour (mph) to 27.1 mph.
- Daily person-hours of delay will increase by over 100 percent from 5.9 million hours to 12.6 million hours.
- Average daily delay per person will increase by 58 percent from 20.0 minutes to 31.5 minutes.
- The percentage of peak period evening work trips completed within 45 minutes for autos will decrease from 74 percent to 73 percent; for public transit, it will decrease from 43 percent to 42 percent.

Table 4-7. Performance Indicators, Measures, and Outcomes of 2035 Goals

Performance Indicator	Performance Measure		Plan 2035	Base Year 2003	Baseline 2035
Mobility	Average Daily Speed (Miles per Hour)		29.5	31.0	27.1
	Average Daily Delay (Daily Person Hours in millions)		10.4	5.9	12.6
Accessibility	Percent PM peak period	Autos	76%	74%	73%

Table 4-7. Performance Indicators, Measures, and Outcomes of 2035 Goals

Performance Indicator	Performance Measure		Plan 2035	Base Year 2003	Baseline 2035
	work trips within 45 minutes of home	Transit	45%	43%	42%
Reliability	Percent variation in travel time	6AM-7AM	14%	16%	N/A
		7AM-8AM	20%	22%	
		8AM-9AM	21%	23%	
		3PM-4PM	23%	25%	
		4PM-5PM	23%	26%	
		5PM-6PM	25%	28%	
		6PM-7PM	23%	25%	
Safety	Daily accident rates per million persons	Fatalities	0.27	0.28	0.31
		Injuries	17.5	16.9	17.8
		Property Damage	30.5	29.0	30.8
Productivity	Roadway capacity – vehicles per hour/lane (Lost Lane Miles)	AM peak	232	288	N/A
		PM peak	348	434	
Sustainability	Total cost per capita to sustain current system performance		Plan 2035 estimates the transportation system will perform better in safety, preservation but worse in delay per capita		

Table 4-7. Performance Indicators, Measures, and Outcomes of 2035 Goals

Performance Indicator	Performance Measure		Plan 2035	Base Year 2003	Baseline 2035
Preservation	Percent of bridges and roadways requiring rehabilitation	Roadways	28%	11%	N/A
		Bridges	24%	6%	
Environmental	Emissions generated by travel (over Baseline 2030)	CO	6-8% reduction		
		PM10	6-8% reduction		
		Exhaust PM10	8-11% reduction		
Environmental Justice	Benefit vs. Burden by quintiles – Auto Percentage of Tax Paid and Time Savings (Quintile 1=lowest income, Quintile 5=highest income)		Plan 2035 estimates:		
			Expenditure	Time Savings	
		1	9%	11%	
		2	13%	15%	
		3	18%	21%	
		4	24%	25%	
		5	36%	27%	
	Benefit vs. Burden by quintiles – Local Transit Percentage of Tax Paid and Time Savings (Quintile 1=lowest income, Quintile 5=highest income)		Plan 2035 estimates:		
			Expenditure	Time Savings	
		1	9%	37%	
		2	13%	28%

		4	24%		11%
		5	37%		5%

Source: SCAG 2008 RTP

The transit improvements within the Regional Connector project corridor would contribute to alleviating the mobility problem in the region and to achieving the Destination 2035 goals. It would do this by:

- Extending the reach and connectivity of all but one of Metro's operational and under-construction LRTs;
- Broadening the range of downtown destinations reachable with one transfer from the Metro Red and Metro Purple Lines;
- Alleviating congestion on the downtown bus network; and
- Increasing the availability of direct service to multiple destinations in Los Angeles County for passengers arriving on intercity services at Union Station.

The area from which Regional Connector ridership is expected to be drawn includes several freeways and major intersections that have significant traffic congestion and long delays. The improved convenience of transit improvements in the Regional Connector Transit Corridor would encourage use of a public transit alternative that would reduce daily vehicle trips, miles traveled, and congestion on the region's roadways.

Transit improvements within the Regional Connector Transit Corridor would also augment public transportation service originating in areas with high population densities and households dependent on public transit. This would increase potential ridership, thereby increasing the project benefits and making it more cost-effective. In addition, the Regional Connector's service area covers the County's most highly-concentrated employment area and a major cultural, entertainment, and tourist destination.

5.0 NEED FOR REGIONAL CONNECTOR TRANSIT CORRIDOR PROJECT

In evaluating the mobility and travel conditions within the project area several issues emerge that reveal a need to provide improved transit connections and service across downtown Los Angeles. These needs include:

- Growth in population and employment will continue to draw both local and regional residents to the project area creating demand for transit services.
- Transit system expansions to the radial network centered on downtown Los Angeles will continue to funnel riders into the unconnected core creating concerns related to insufficient Red Line capacity for connecting riders, overcrowded station platforms, and regional system schedule reliability.
- Transit dependent populations within the project area include low income households, significant populations of very old persons, and a high percentage of zero car households.
- Travel demand data highlights the congested nature of the downtown core, the high percentage of commuters that come from outside of the project area, and the built up nature of the project area that prevents expansion of the road network.
- Transit usage requires multiple transfers for cross-town trips for both local and regional riders increasing travel times.
- Local land use plans and policies support increased transit alternatives, linking the regional system through downtown, and transit and pedestrian friendly design in downtown communities.

5.1 Growth and Increased Demand for Transit Services

One of the most pressing issues affecting the region's ability to effectively meet travel demands is population growth. Los Angeles County alone is expected to increase 18 percent to a total of 12.3 million people by 2035. Within the project area, population growth is expected to exceed 31 percent (Table 5-1). Along with increased population, employment within the project area is also expected to increase 7 percent by 2035 (Table 5-1). This expected growth will lead to increased travel demand throughout the region.

Employment in the project area is higher than the population (Table 5-1) which indicates that most of the people who work in the project area do not also live there and must come into the area from the surrounding region. As shown in Figure 5-1 and 5-2, the areas of highest

population density are not in the same locations as the areas of highest employment density. This geographical difference between where people live and where they work creates a transportation need. Improvements to transit services in downtown Los Angeles will be needed to bring workers from areas of high population and low employment density to the project area, where the highest concentration of employment opportunities is located. Figures 5-3 and 5-4 show that this condition is not expected to change in the projection year 2035.

In addition to regional commuters, the increase in population within the project area will continue to create a need to provide a variety of transit options within downtown Los Angeles. Transit improvements that increase mobility within the project area will benefit this increased population as well.

Table 5-1. Population, Household, and Employment Growth

Area of Growth	2008	2035 Forecast	Percent Change 2008-2035 (%)
Population			
Project Area	19,396	25,417	31.0
LA County	10,449,838	12,338,620	18.1
Households			
Project Area	9,648	13,054	35.3
LA County	3,298,886	4,003,501	21.4
Employment			
Project Area	171,750	184,567	7.4
LA County	4,498,598	5,041,172	12.1

Source: SCAG, 2008 data and 2035 projections.

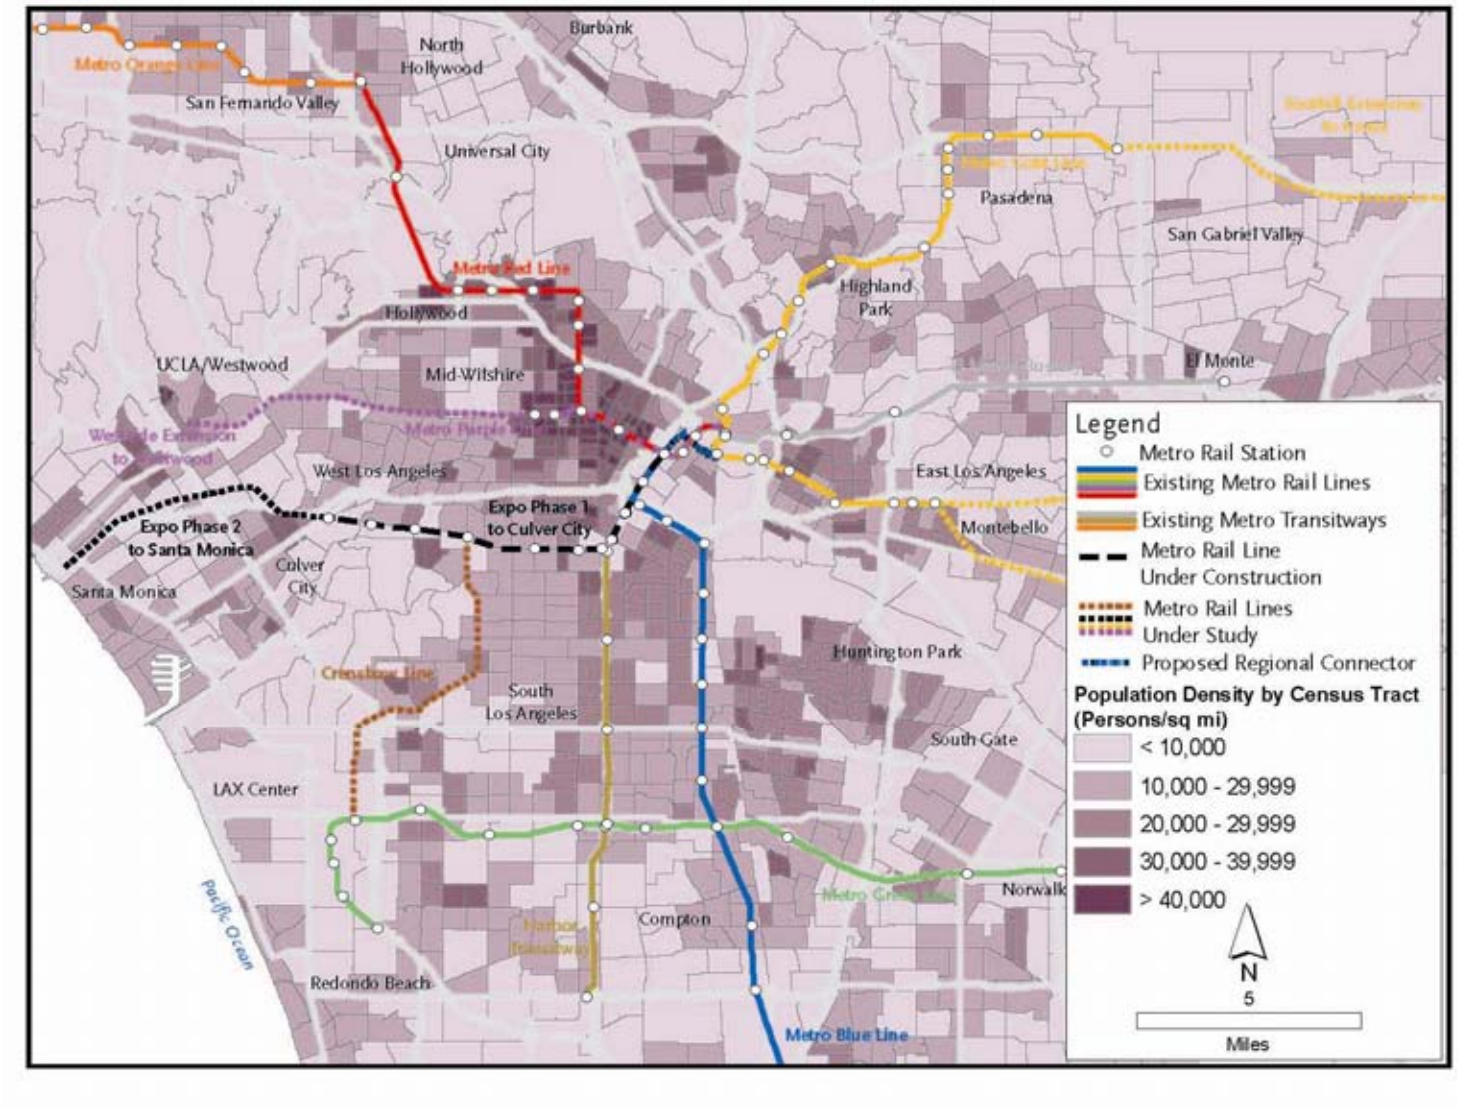

Figure 5-1. Regional Population Density (2005)

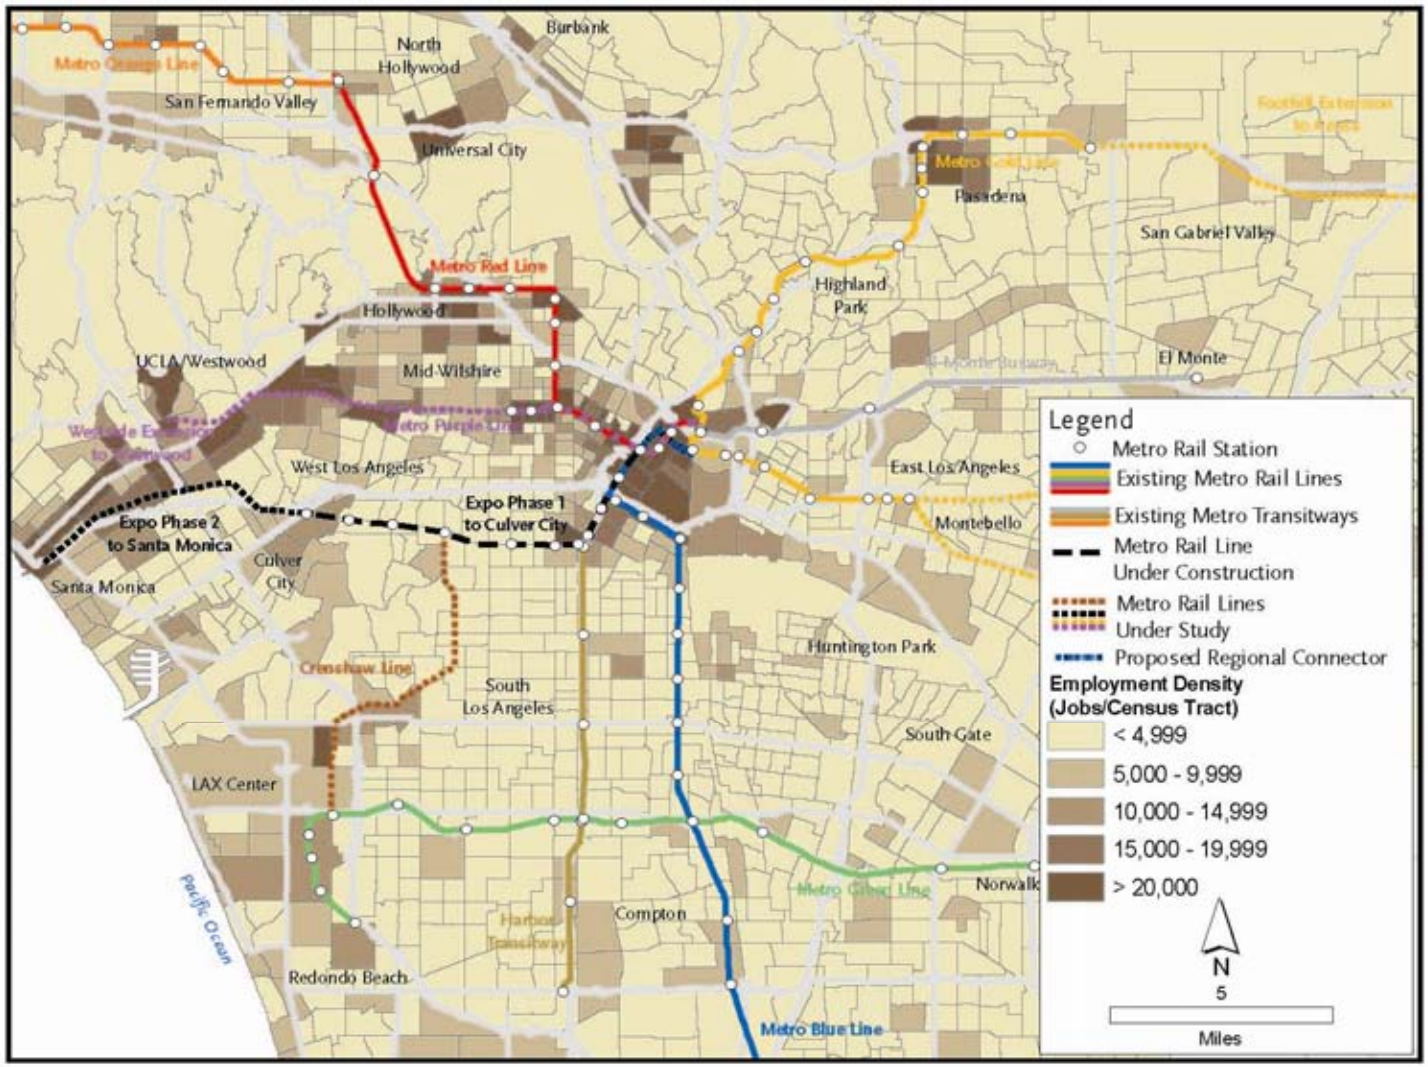

Figure 5-2. Regional Employment Density (2005)

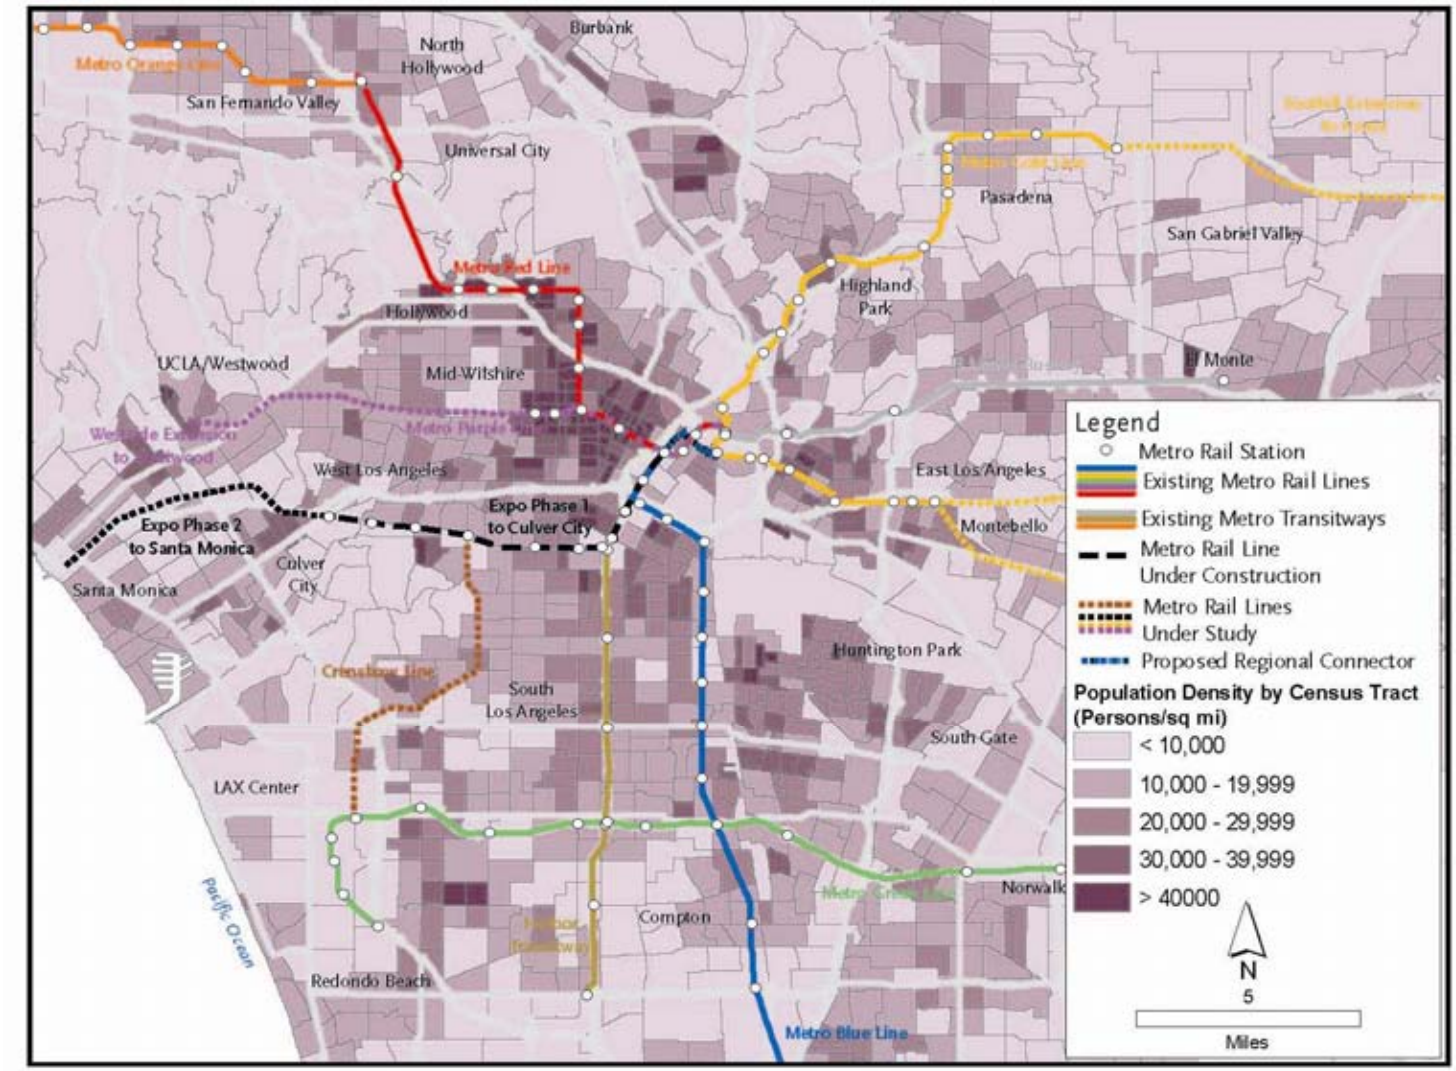

Figure 5-3. Projected Regional Population Density (2035)

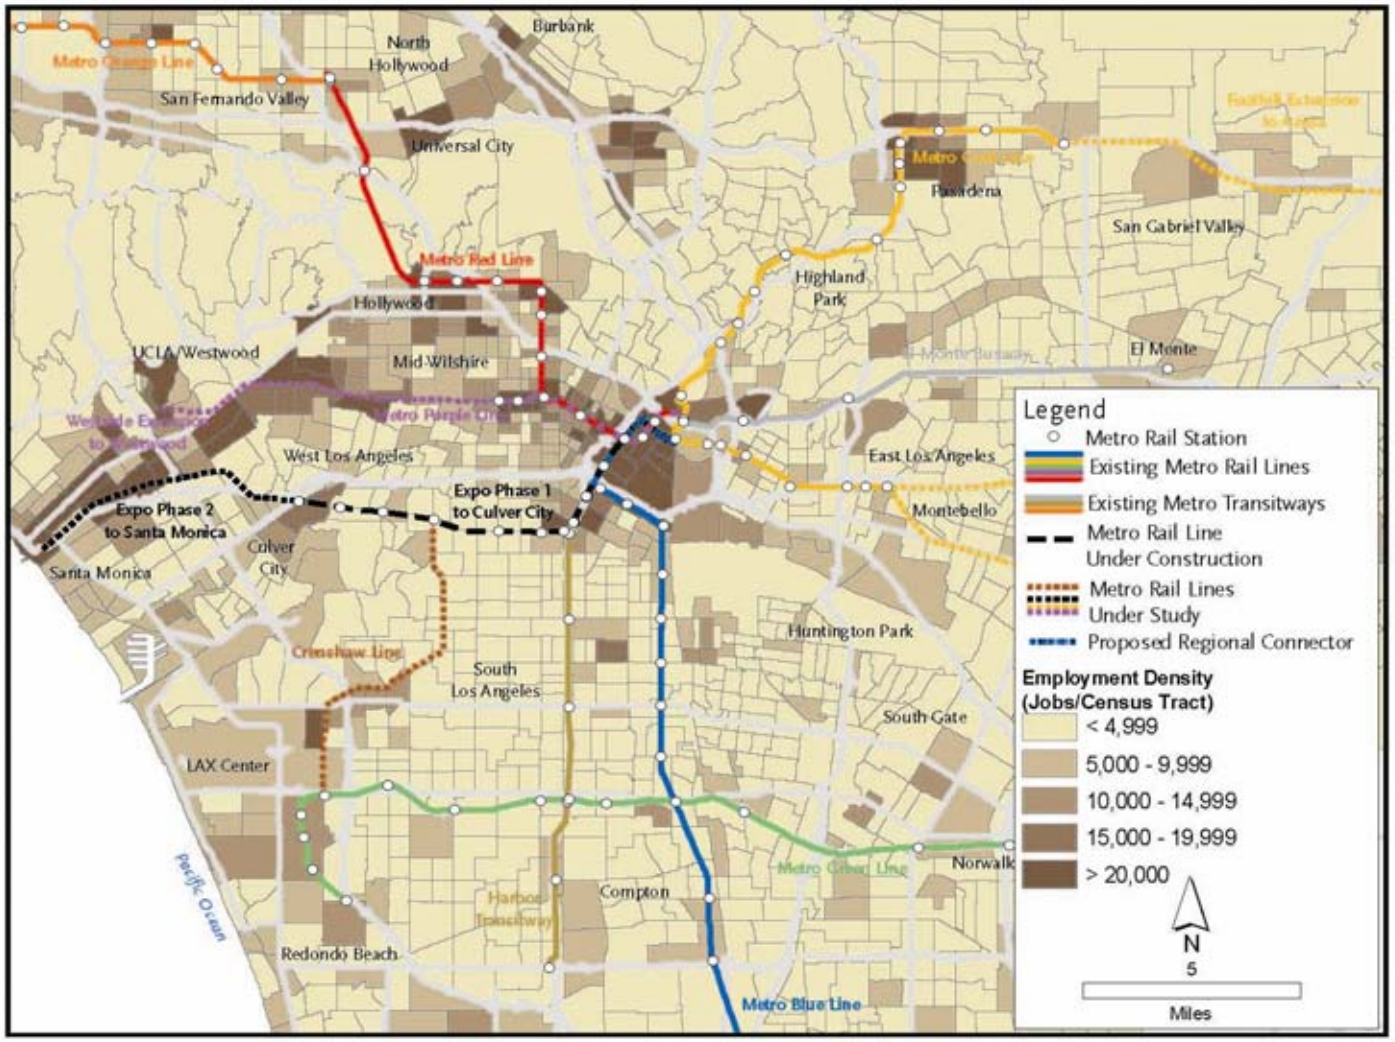

Figure 5-4. Projected Regional Employment Density (2035)

Census tracts with the largest populations (greater than 2000 people) are found within the project area east of Main Street between 1st Street and 7th Street and east of San Pedro Street between Temple Street and 1st Street According to SCAG projections, in 2035, slightly less growth is expected in the project area compared to the whole County. The population in the project area is expected to grow by about 30 percent from about 19,396 in 2008 to 25,417 people in 2035.

The largest growth in the project area is projected in two locations:

- The area bounded by SR-110, Hill Street, 1st Street, and 3rd Street, which will increase from between 1,500 to 1,999 people to over 2,000 people; and
- The area bounded by Hill Street, Main Street, 7th Street, and 9th Street, which will increase from 1,000 to 1,499 people to 1,500 to 1,999 people.

Projected population is based on fairly conservative estimates made by SCAG in 2008. Figures 5-5 and 5-6 show the distribution of existing and projected total population within the project area.

Several planned high-rise residential projects in the project area contribute to the high level of expected growth. These include the Park Fifth condominium project at 5th and Hill Streets, the Block 8 condominium and rental project under construction between 2nd, 3rd, San Pedro, and Los Angeles Streets, and the 8th & Grand condominium and retail project at 8th Street and Grand Avenue.

The total number of households is also projected to increase 27 percent from about 10,300 in 2008 to 13,000 in 2035, which is higher than the 21 percent projected for the County.

The employment base is projected to increase by about 7 percent from over 171,700 individuals in 2008 to over 184,500 in 2035. Current and projected employment within the project area are both between three and four percent of total County employment.

Figure 5-7 shows the distribution of employment in the project area in 2005. At that time, total employment in a majority of the census tracts within the project area was over 5,000, with areas of highest concentration (greater than 12,500 jobs) in three locations:

- The area bounded by SR-110, Flower Street, 7th Street, and 9th Street;
- The area bounded by SR 110, Hill Street, US 101, and 1st Street; and
- Part of the area bounded by Hill Street, Alameda Street, US 101, and 2nd Street

A large employment base indicates that a significant number of workers commute within, into, and out of the project area. Figure 5-8 shows the projected distribution of employment in 2035.

Providing public transportation to densely-populated areas can increase ridership by making transit more accessible to a larger population. The areas of highest population density are found in two locations within the project area:

- The area bounded by 1st Street, 3rd Street, SR 110, and Hill Street; and
- The area south of 5th Street and east of Hill Street

Figure 5-9 shows the distribution of population densities according to the 2000 census. The highest employment density exists in the project area in the area bounded by US-101, 3rd Street, SR 110, and Hill Street (Figure 5-10).

Average population density is projected to grow to roughly 12,700 persons per square mile, and average employment density is expected to be over 92,000 employees per square mile. Figures 5-11 and 5-12 show projected 2035 population and employment densities.

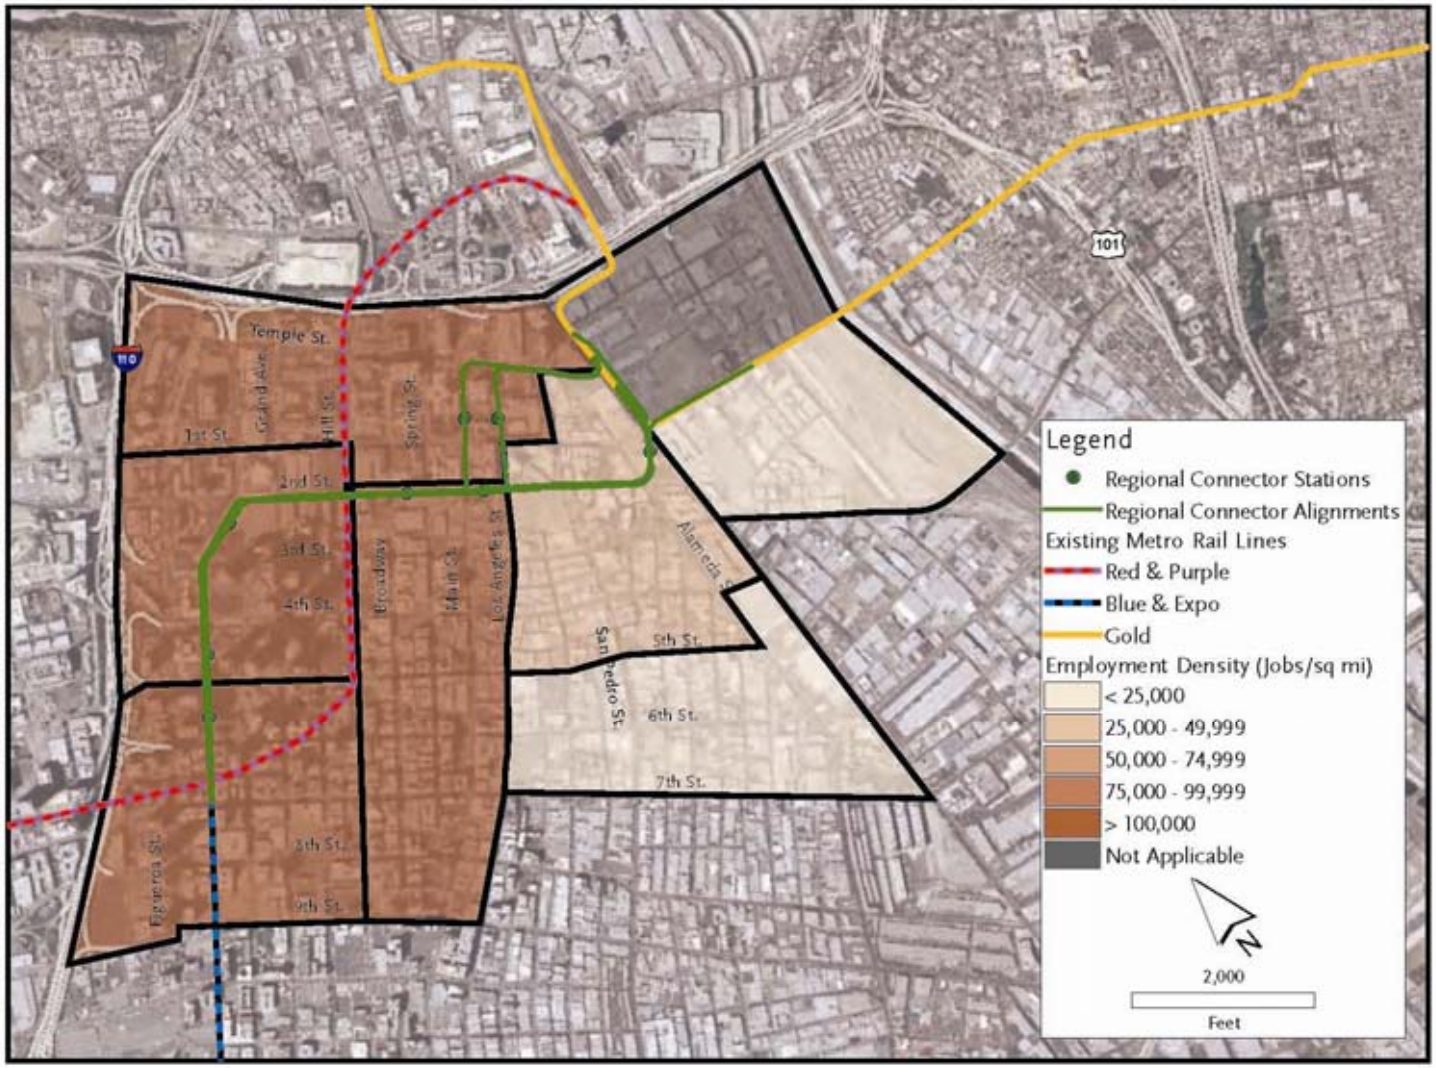

Figure 5-12. Projected Employment Density in Project Area (2035)

5.2 Regional Transit System Expansion

By 2035, the Metro rail system will have been expanded to the north and east with extensions to the Gold Line and to the west with extensions to the Purple and Expo Lines and the addition of the Crenshaw Line. This radial network centered on downtown Los Angeles will continue to funnel riders into the central city core.

Central downtown Los Angeles is a top destination for trips originating outside of the project area from both the east and west. For example, over 50,000 daily trips (approximately 25 percent of external trip destinations) are made for work from the greater eastside to central Los Angeles.

The project area is located in the crossroads of the region's transportation system. Transit riders that arrive at either the 7th Street/Metro Center Station or Union Station generally continue on to other destinations. For example, nearly three quarters of the passengers riding on the Metro Gold Line from Pasadena to Union Station transfer to the Metro Red Line for continued service into other parts of the City.

As additional service comes on line, additional riders to downtown will contribute to crowding on the platforms at these stations that serve as main transfer points to other destinations. At the 7th Street/Metro Center Station, Metro Red and Purple Line passengers wishing to use the Flower Street escalators must share the crowded passageways leading to the Metro Blue Line platform. Metro Expo Line passengers would add to the crowds on the existing Metro Blue Line platform. As riders from these lines transfer to the Metro Red and Purple Lines on the lower platform overcrowding is a concern there as well.

Additional service to downtown will increase the number of riders needing to transfer to the Red Line to continue to their ultimate destinations. This creates a concern related to insufficient Red Line capacity for connecting riders. Additional travel delays could be introduced for individuals if they are unable to get onto a particular Red Line train due to overcrowding.

The gap in rail service between the 7th Street/Metro Center Station and Union Station creates issues for riders who must transfer to the Red Line or other modes to continue their trips and contributes to overcrowding on main transfer station platforms. These issues will increase as new routes are brought into service.

Current transit usage in the region is the highest in Central Los Angeles, with additional areas of moderate transit usage in the Westside, Hollywood, Pasadena, the South Bay, and Pasadena, as shown in Figure 5-13. Transit usage is projected to increase in these areas by 2035. The highest transit usage areas are found along the existing Metro Red Line and Metro Purple Line corridors. There is also high transit usage in the Westside area where there are many students who are reliant on public transportation. It should be noted that Figure 5-13

shows the number of persons taking transit to work, and actual ridership is higher because patrons use transit for other types of trips as well. Also, the year 2000 census data predates many portions of the Metro Rail system, and transit ridership has risen in these areas since the initiation of service.

Additional transit opportunities created by the Regional Connector for commuters on the Metro Blue and Gold lines are expected to increase the number of trips along the corridors of both. The Regional Connector will alleviate congestion on the already heavily-used Metro Red and Purple Lines by eliminating the need for Metro Blue and Gold line commuters to transfer through them.

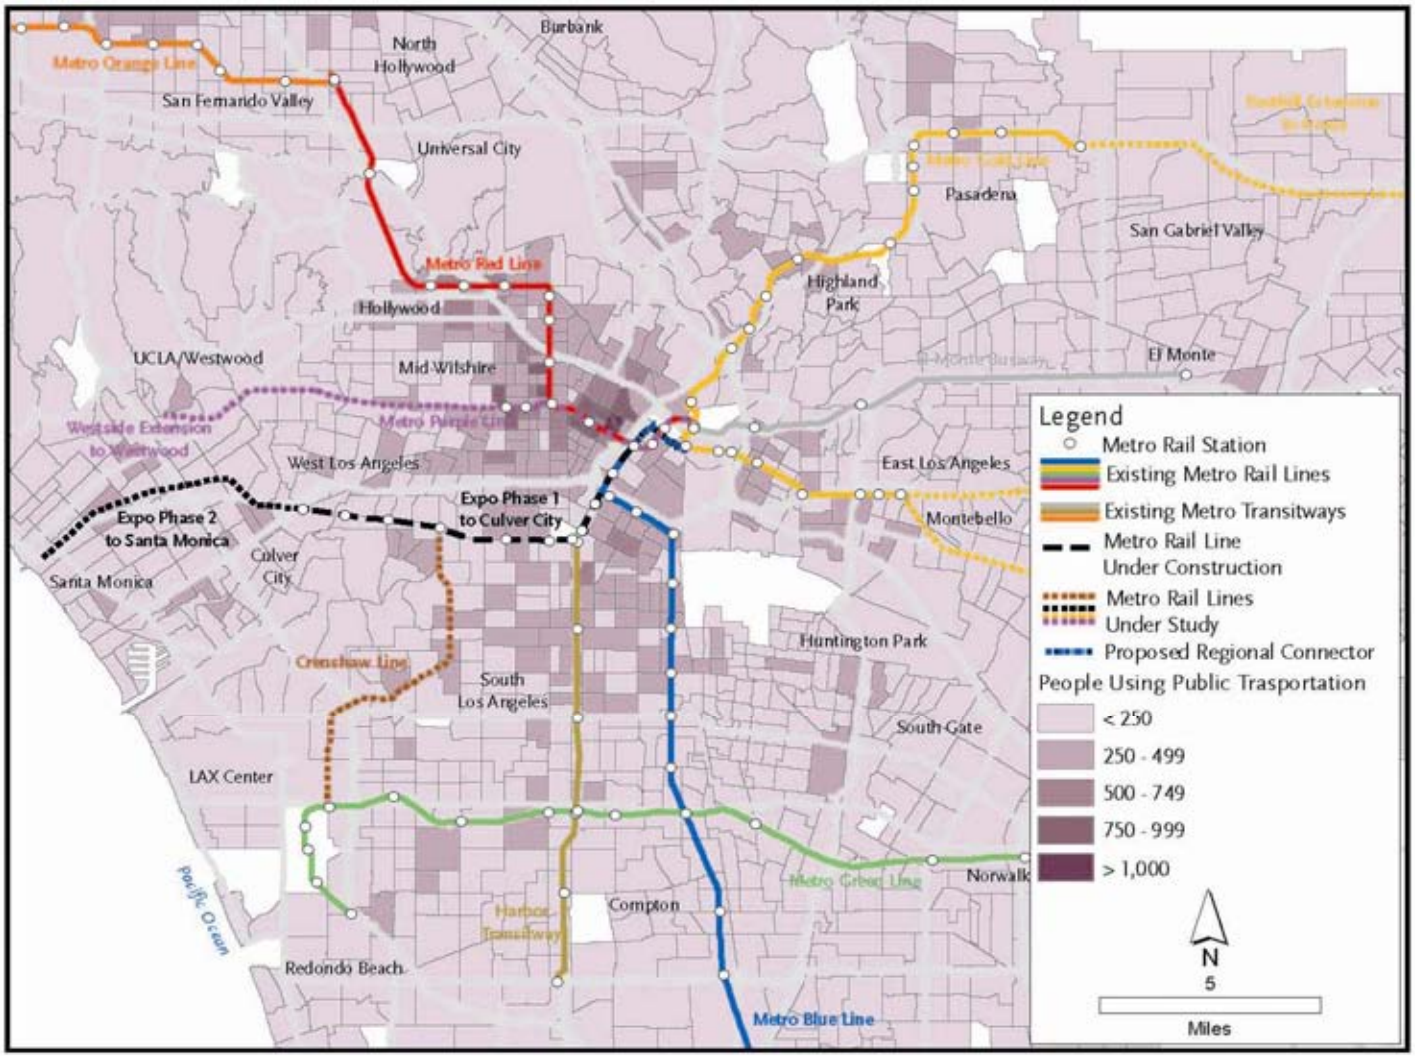

Figure 5-13. Regional Work-bound Transit Trips (2000)

5.3 Transit Dependent Populations

Transit dependent populations are those groups that rely on public transit to meet their mobility and access needs to a greater degree than the general population. Within the project area, transit dependent populations include low income households, seniors, and zero car households (Table 5-2).

Low-income households were defined by the US Census Bureau in 2005 as those below the poverty threshold with an annual average salary of $12,755 for a two-person household. Low-income households represented about 38 percent of the total households in the project area. This high proportion of low-income households underscores the need for public transit.

Senior residents within the Project Area are more likely to depend on public transit because of an inability to drive or lack of private vehicle accessibility. Almost 20 percent of the project area population is seniors. Young people, under 18 years of age, may also be considered transit dependent for similar reasons. Approximately 6 percent of the population in the project area is under the age of 18.

Over two thirds of the households in the project area have no car. Eleven percent of employed residents age 16 and over rely on public transit for their commuting needs. When comparing vehicle accessibility and public ridership patterns in the project area, the trends suggest that even households with one or more cars have a higher propensity to use public transportation than similar households elsewhere in the County.

Table 5-2. Transit Dependent Demographic Information

Demographic	Project Area	Percent (%) of Project Area	LA County	Percent (%) of County
Population	19,396	NA	10,010,315	NA
Under 18 years	1,188	6.1	2,798,604	27.9
Over 65 years	3,795	19.6	926,670	9.2
Households	9,648	NA	3,298,210	NA
No vehicle households	6,505	67.4	671,214	20.3
Use public transportation	1,121	11.6	254,091	7.7
Households below poverty level	3,575	37.0	1,481,896	44.9

Source: SCAG, 2005 data and 2030 projections and U.S. Census Data Summary Files 1 and 3, 2000

Some of the project area's transit-dependent population lives within convenient walking distance (one-quarter to one-half mile) of the Regional Connector termini, while much of the rest of the area will be able to easily access the corridor and potential stops along the corridor.

The project area can be characterized as more transit-dependent than the County as a whole because of its dense population, proportionately low income levels, number of households with zero vehicles, and public transportation users. A significant portion of the County's transit riders live and/or work within the project area; this is projected to increase through 2035.

Transit dependent populations are particularly impacted by deficiencies in the transit system. The gap in the light rail system between the 7th Street/Metro Center Station and Union Station that creates travel delays affects these populations disproportionately.

Figure 5-14 shows the distribution of low-income households in 2005. Census tracts within the project area that have greater than 1,000 low-income households were:

- The area bounded by SR-110, Hill Street, 1st Street, and 3rd Street; and
- The area bounded by Hill Street, Alameda Street, 5th Street, and 7th Street.

Figure 5-15 shows the distribution of residents age 65 and over in the project area. The senior population is highest west of Hill Street and south of 1st Street. Figure -16 shows the distribution of residents age 18 and under in the project area. The youth population is found primarily in the southern part of the project area, south of 5th Street.

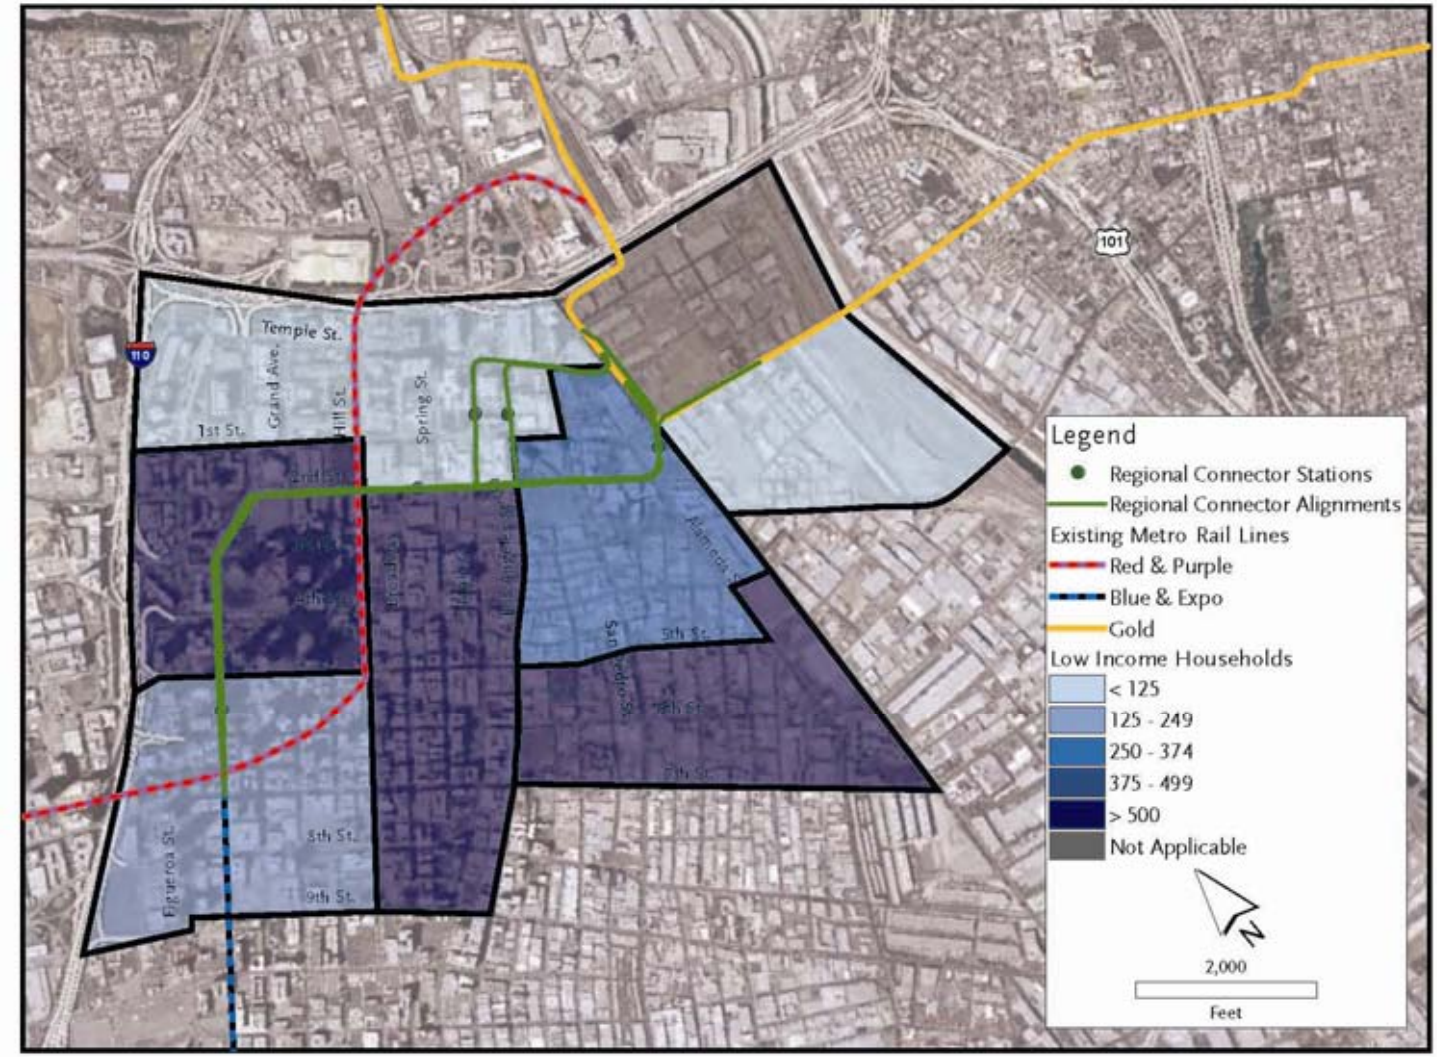

Figure 5-14. Distribution of Low Income Households in Project Area (2006)

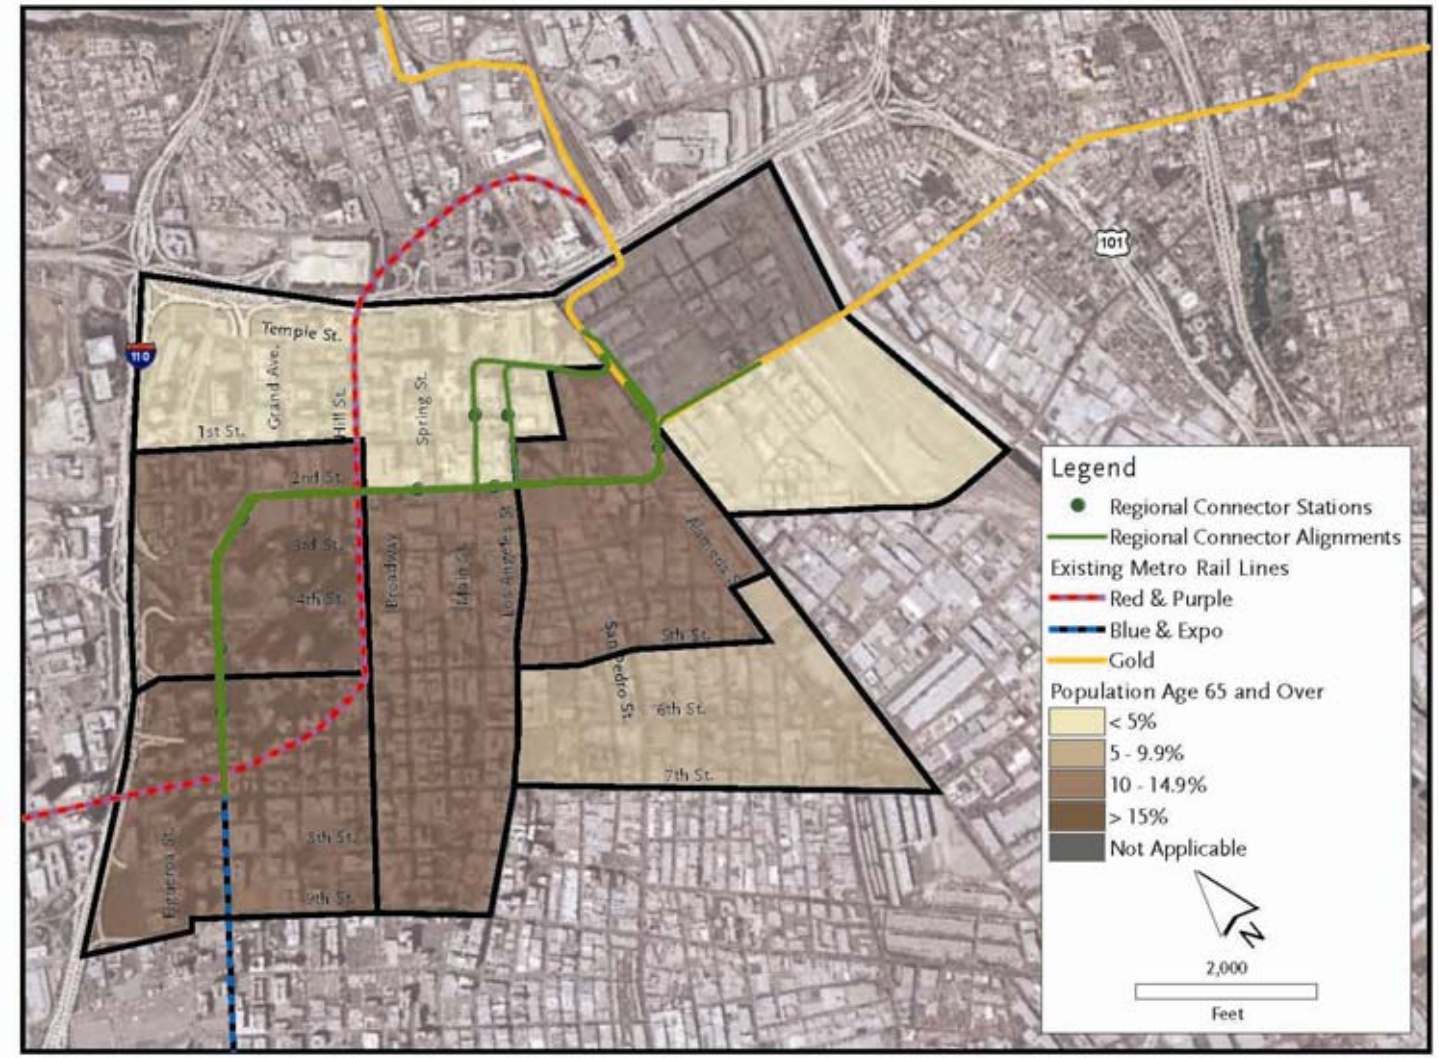

Figure 5-15. Distribution of Population Age 65 and Over in Project Area

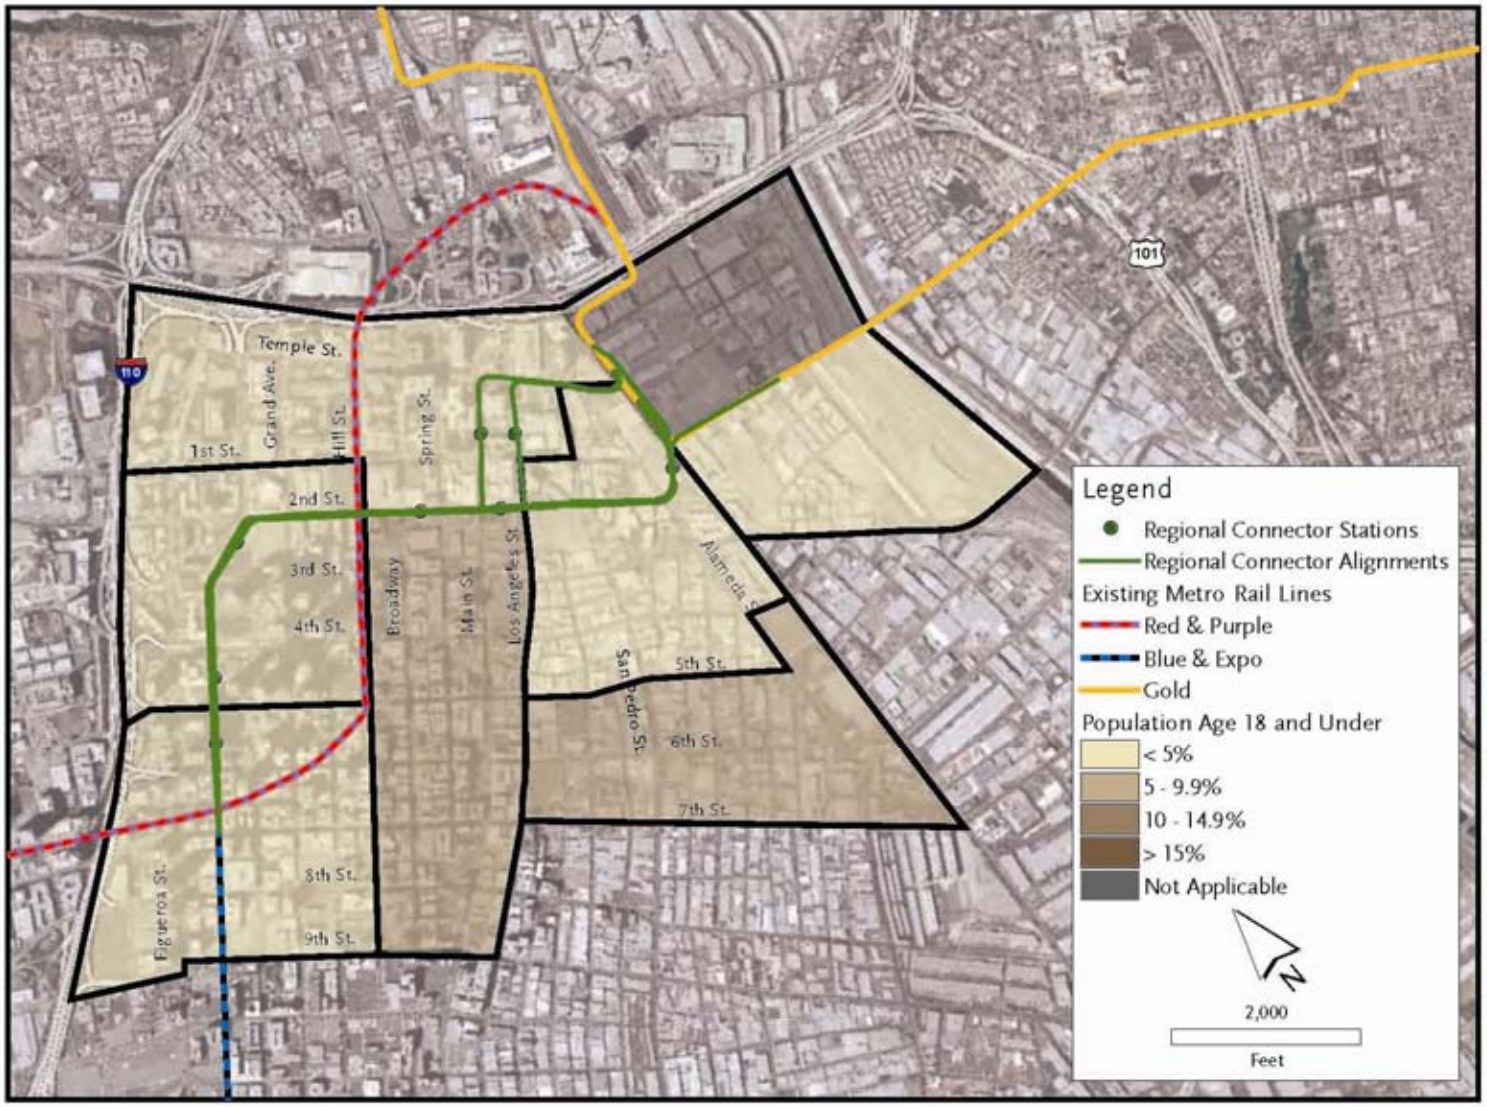

Figure 5-16. Distribution of Population Age 18 and Under in Project Area

5.4 Travel Demand

The majority of the congestion within the project area and the region is from travel on the highways and local arterial network regardless of transportation mode. If the current trend persists, travel delays are expected to rise to 5.7 million person hours by 2035, more than double currently experienced delays, which will deeply affect highway productivity (SCAG 2008).

Bus service runs in a grid pattern through the downtown area, with most lines terminating at the periphery after having passed through. Nearly all streets within the project area have bus service during peak hours. Transit service within the project area is highly dependent on the condition of the surface streets and connections to the freeway system.

Performance of intersections is measured by LOS. LOS D is a "fair" level of service with potential delays at the intersection between 35 and 55 seconds; LO F represents intersection failure with backups preventing movement out of the intersection. LOS is a measure of how congested an area is which helps to identify areas that need transportation improvements.

All of the key intersections currently operate at LOS D or better during both the AM and PM peak hours. Only the Figueroa Street and Wilshire Boulevard intersection is operating at LOS F in the PM peak hour. By 2035, up to 28 intersections in the project area will be at LOS E or F in the PM peak hour without transit improvements in the project area.

Demand for transit service in the project area is also high. There are 51 bus lines, mostly operated by Metro, with over 174,000 daily passenger boardings and alightings within the project area. On several routes, during rush hour the time between buses on a particular line shrinks to less than five minutes, and some stops are served by over a dozen lines.

Without transit improvements in the project area, service for all transportation modes within the project area will continue to decline.

5.5 Transit Usage

Downtown Los Angeles has long been considered a major destination for employment, education, and services; it is now experiencing a resurgence as a center for entertainment and the arts, and increasingly, residential living. However, travel to and from activity centers both in the project area and in the surrounding region often require more than one transfer. Examples of key activity centers include the University of Southern California, downtown Long Beach and Culver City, Old Town Pasadena, Chinatown, Los Angeles Coliseum, or the Los Angeles County Museum of Natural History.

The ridership benefits of increasing trip speeds have been demonstrated in Los Angeles by the Metro Rapid program. The 2002 Demonstration Program Final Report noted that the

implementation of the rapid bus service led to 23-29 percent improvement in trip speeds, an increase from 9mph to 12mph. While this difference may seem small, ridership on the Wilshire/Whittier corridor increased by 42 percent as a result.

According to Metro's 2004 Metro Rail Onboard Survey, 42 percent of Metro Gold Line riders indicated that they rode two trains on their one-way trips, and seven percent rode three trains. Since Union Station is the only current rail-to-rail transfer point on the Metro Gold Line, these results suggest that a large portion of Metro Gold Line riders are transferring to the Metro Red Line to complete their trips.

The transfer between the Metro Red or Purple Line and the Metro Gold Line at Union Station can take up to 20 minutes, and the platforms are approximately a four-minute walk apart. The transfer between the Metro Red or Purple Lines and the Metro Blue Line at 7th Street/Metro Center can also take up to 20 minutes.

The combination of these combined travel delays is a disincentive to riders wishing to travel in an east-west direction. As the number of transfers required increases, the number of people who will attempt a particular transit trip declines (Table 5-3).

Table 5-3. Train/Bus Use per Trip

Train or Bus	All Lines
1 Train	53%
2 Trains	38%
3 Trains	7%
4 Trains	2%
1 Bus/Train	22%
2 Bus/Train	34%
3 Bus/Train	25%
4+ Bus/Train	19%

Source: 2004 Metro Rail Onboard Survey

Metro's 2004 Metro Rail Onboard Survey indicates that relatively few Metro Gold Line riders currently continue beyond 7th Street/Metro Center Station toward Long Beach on the Metro Blue Line. The current bus ridership indicates that this is likely due to too many transfers

being needed. With the opening of the Metro Expo and Metro Gold Line to East Los Angeles it is likely that double transfers will increase due to the east-west travel demands.

5.6 Land Use Plans and Policies

Local land use plans and policies support increased transit alternatives, linking the regional system through downtown, and transit and pedestrian friendly design in downtown communities.

5.6.1 Regional Plans

In May of 2008, SCAG released its Regional Transportation Plan (RTP) entitled "Making the Connections". This document provides a basic policy and program framework to improve the transportation system and integrate it with the population growth patterns for the region through 2035.

5.6.2 Studies

Mobility issues throughout the region and the identified need to join the unconnected segments of the light rail system have been documented in several past studies, including the *Pasadena—Los Angeles Light Rail Transit Project Environmental Impact Report* (1993), the *Blue Line Connection Preliminary Planning Study* (1993), and the *Regional Light Rail Connector Study* (2004).

The *Pasadena - Los Angeles Light Rail Transit Project Environmental Impact Report* identified a need to connect the 7th Street/Metro Center Station with Union Station in 1993. However, this segment was not constructed with the development of the Metro Gold Line due to funding constraints.

Also in 1993, the *Blue Line Connection Preliminary Planning Study* identified a potential capacity problem for the Metro Red Line, as it was the sole rail connection between Union Station and the 7th Street/Metro Center Station.

5.6.3 Policies and Guidelines

Local land use plans and policies support the development of additional transit service within the project area. The City's General Plan establishes a number of goals and corresponding policies that support the development of public transit.

5.6.3.1 County of Los Angeles General Plan

The County's General Plan establishes a number of goals and corresponding policies that support the development of public transit.

- Goal C-1: An accessible circulation system that ensures the mobility of people and goods throughout the County.
    - Policy C1.1: Expand the availability of transportation options throughout the County
    - Policy C1.2: Encourage a range of transportation services at both the regional and local levels, especially for transit dependent populations.
    - Policy C1.3: Secure an affordable countywide transportation system for all users.
    - Policy C1.4: Maintain transportation right-of-way corridors for future transportation.
- Goal C-2: An efficient circulation system that effectively utilizes and expands multi-modal transportation options.
    - Policy C2.1: Support the linking of regional transportation systems.
    - Policy C2.2: Expand transportation options throughout the County.

5.6.3.2 Downtown Design Guidelines

The Community Redevelopment Agency of the City of Los Angeles (CRA) has drafted design guidelines for all new developments within downtown Los Angeles. These guidelines provide incentives for residential development by modifying code requirements such as density limits for projects that meet a number of criteria including providing accessible transportation with emphasis on walking, biking, and transit other than autos.

With the overall goal of creating a livable downtown, guidelines focus on providing the following:

- A broad range of housing types;
- Accessible transportation with emphasis on walking, biking, and transit other than autos;
- Shops and services within walking distance to housing;
- Safe, visually-pleasing and walkable streets;
- Parks and other gathering places near to shops and services; and
- Public recreational open space within walking distance to home.

The guidelines set forth specific standards for design and construction, including use of sustainable materials and practices, preserving historically- and culturally-significant buildings, and supporting environmental and aesthetic resources. The guidelines ultimately call for developers to consider pedestrians and not cars in their design process. The objective is to create a cohesive transition along blocks while creating inviting and open spaces that encourage pedestrian traffic. As outlined above, increasing public transit options is one way to meet this objective.

5.6.3.3 Little Tokyo Planning & Design Guidelines

The Little Tokyo Community Planning and Design Guidelines also promote pedestrian- and transit-friendly designs which support cohesiveness through the corridor while maintaining cultural integrity.

As a result of recent resurgence and popularity in the Little Tokyo district of downtown, a set of design guidelines was created with the intent of encouraging individual expression and continuity of the surrounding environment through building and street design, while enhancing elements and aesthetics that are significant to the Japanese-American Community. In addition to the preservation of existing physical and cultural spaces, the guidelines identify specific standards for new developments and streetscapes in order to maintain continuity throughout. Street dedication requirements, such as those in place for new development east of Alameda Street between Temple Street and 1st Street, promote pedestrian- and transit-friendly designs which support cohesiveness through the corridor while maintaining cultural integrity. This, in turn, will enhance pedestrian activity and increase the attractiveness of walking and transit use in the area.

5.6.3.4 CommuteSmart®

Metro provides services through CommuteSmart® to help people find alternatives to a single-person car commute such as carpooling, vanpooling, park-and-ride, and public transit. CommuteSmart® also assists employers to set up rideshare programs, create incentives for commuting, and perform ongoing assessments and training. Improvement of public transit options while promoting the use of public transit would increase ridership more than either done alone.

6.0 POTENTIAL TRANSIT MARKETS

Potential transit markets are two-fold for the Regional Connector:

- The activity centers and major destinations that include public and private uses, density of population and employment, and major travel patterns that traverse the project area;
- Travel patterns through the project area, since the Regional Connector would link over 50 miles of Metro LRT service from Pasadena to Long Beach, and from Culver City to the Eastside and everywhere in between.

This Draft EIS/EIR will result in projections of ridership generated by people moving within the project area and through the project area to get to and from homes, jobs, services, and entertainment.

Key advantages for the Regional Connector presented by the project area are the easy bus connections provided by the dense transit network, convenient regional and intercity rail interface, and the location of activities and services within walking and biking distance of each other.

6.1 Activity Centers and Destinations

Several activity centers exist within the project area. These include Educational, Recreational, Business/Industrial and Commercial centers.

Downtown has long been considered a major destination for employment and services; it is experiencing a resurgence as a center for entertainment and the arts, and increasingly, residential living.

6.1.1 Bunker Hill

The Bunker Hill District is located generally between First Street on the north, Hill Street on the east, Third Street on the south, and Figueroa Street on the west. Major downtown destinations located within Bunker Hill include the Walt Disney Concert Hall, Museum of Contemporary Art (MOCA) and several high-rise office towers, senior and market-rate housing, hotels and commercial/retail centers. Bunker Hill offers over 3,200 residential units mainly in mid- and high-rise buildings.

Large development projects planned for this area include Civic Park and the Grand Avenue Development Project, which will transform this area into a regional arts, entertainment, and residential destination. The Grand Avenue Development is a $3 billion project that includes

3.6 million square feet of development with 449,000 square feet of retail. It is currently planned for 2,600 housing units, almost doubling the existing number of units in the area.

6.1.2 Civic Center

Bordering Bunker Hill to the northeast is the Civic Center, which serves as a hub for City, County, State, and Federal government with the second-largest concentration of civic buildings in the country. The Cathedral of Our Lady of the Angels, the Ahmanson Theater, Mark Taper Forum, and the Dorothy Chandler Pavilion are other major destinations in this district.

Civic Center is undergoing active redevelopment. The new headquarters for the state Department of Transportation (Caltrans) District 7 has recently been completed, development of the new Los Angeles Police Department Headquarters is underway, and construction of a U.S. Federal Courthouse is soon to begin.

6.1.3 Little Tokyo

East of Civic Center is Little Tokyo, which serves as the center of the largest Japanese-American community in the continental United States. The Japanese American National Museum and The Geffen Contemporary at MOCA are located here, along with a lively shopping district.

The popularity of Little Tokyo is evidenced by the active residential development underway, with recently completed and current projects adding more than 2,000 residential units. Significant developments in the early planning stages include a 4.5-acre site adjacent to the Little Tokyo Arts District Station of the Metro Gold Line. Early concepts from developers identified high-density combination of office and housing with strong connections to the adjacent Metro Gold Line Eastside Expansion.

6.1.4 Toy District

The Toy District is a 12-block shopping area with over 500 retail businesses located south of Little Tokyo and north of Central City East. Development here is centered on mixed-use. The proposed Medallion building, one of several projects currently under construction, will provide 192 residential lofts and over 200,000 square feet of retail space.

6.1.5 Financial Core

The Financial Core District is located south of Bunker Hill and is dominated by high-rise office buildings. The Central Library, built in 1926, destroyed by fire in 1986, and rebuilt, expanded, and re-opened in 1993 is located here. Other landmarks in this district include the Millennium Biltmore Hotel (built in 1923) and Pershing Square (dating back as far as 1866 as a park).

The proposed 2.7-million square-foot, four-phase Metropolis mixed-use development will be located in the southwestern end of the Financial District. Phase I of this project, which began construction in 2008, will provide 360 residential units. Park Fifth is another major planned 76-story high-rise development across from Pershing Square and will include over 700 condos and a 200-room hotel.

6.1.6 Historic Core

To the east of the Financial Core is the Historic Core District, containing a large concentration of historic and architecturally-significant buildings, including the Bradbury Building (built in 1893). The Grand Central Market (dating back to 1917 as an open-air market) and the Broadway Historic Theater District (with theaters dating back to the early 1900s) are destinations in this district.

Development here is focused on conversion of old neglected buildings into lofts and apartments. The Historic Core experiences high volume retail sales on Broadway Street, which is a largely sidewalk-oriented retail district. Due to the shortage of parking in the area, the retail district is reliant on public transit to bring patrons to the neighborhood.

6.1.7 Jewelry District

The largest jewelry district in the U.S. and second largest in the world is located southwest of the Historic Core, where 5,000 businesses generate billions of dollars in revenue.

Development in this area includes the proposed construction of 875 condominium units at 8th Street and Grand Avenue. Like the Historic Core, parking is in short supply and the district attracts a high volume of retail sales.

6.1.8 Central City East

The Central City East District is located south of the Toy District and consists primarily of commercial uses, including wholesale buildings and warehouses. The Flower Market, produce, fish and food processing industries as well as import/export businesses employ nearly 20,000 people in this area. Housing in this district consists mainly of the 6,500 single-room occupancy hotel units. This area is also important in providing social services, including alcohol treatment, mental health services, and job training.

6.1.9 Outside of the Project Area

Other important downtown development projects outside of the project area include the recently-opened LA Live, a 4-million square foot complex of retail, restaurants, office, theater, hotel, parking, and residential space adjacent to the Staples Center.

6.1.10 Regional Activity Centers and Destinations

Due to the improved linkages provided by the Regional Connector, LRT will be enhanced throughout the region thereby attracting new ridership on existing lines.

Key regional activity centers that will attract riders to ride seamlessly through the project area to get destinations that, today, require more than one transfer, include:

- University of Southern California via Metro Expo Line
- Los Angeles Trade Technical College via Metro Blue Line
- Downtown Long Beach via Metro Blue Line
- Downtown Culver City via Metro Expo Line
- Crenshaw District via Metro Expo Line
- Downtown Pasadena via Metro Gold Line
- Old Town Pasadena via Metro Gold Line
- South Pasadena via Metro Gold Line
- Chinatown via Metro Gold Line
- City of Compton via Metro Blue Line
- Highland Park via Metro Gold Line
- Boyle Heights via Metro Gold Line
- Arts District via Metro Gold Line
- East Los Angeles Civic Center via Metro Gold Line
- East Los Angeles College via Metro Gold Line
- Los Angeles Coliseum via Metro Expo Line
- Los Angeles County Museum of Natural History via Metro Expo Line
- Watts via Metro Blue Line

6.2 Local Redevelopment Plans and Transit Improvements

Many of the communities in the project area are focusing on redevelopment projects to meet increasing residential and commercial demands. Several large commercial centers or mixed-use developments have been identified within the project area. These centers are typically ideal locations for public transit services due to the large number of patrons and opportunity to alleviate inbound and outbound traffic congestion.

Following are some of the current CRA projects in the project area:

- Downtown Streetcar – This transportation infrastructure project creates a 3 mile (approx) circulator using modern streetcar technology to connect the Broadway Corridor to LA Live and the Grand Avenue Project.
- Bunker Hill Design for Development – This project would amend the 1971 Design for Development (DFD) and increase the maximum floor area ratio in the Bunker Hill Redevelopment Area from 5.0 to 6.0. This would in turn allow 20 percent more square footage than the current DFD. The project is currently in the Environmental Impact Report (EIR) phase.
- Park Fifth – An EIR is currently being prepared for a new high-rise residential building on 5th Street between Hill and Olive Streets, proposed as the tallest U.S. residential structure west of Chicago. The project will contain market-rate condominium units, a five-star hotel, and ground floor commercial space.
- 8th & Grand – This is a condominium project with ground floor restaurants and retail located on 8th Street between Grand Avenue and Olive Street The project was approved by the CRA Board and the City Council in 2006.
- Medallion Phase I – Located at 334 S Main St this first of two phase project will create a mixed use development including apartments, commercial space, public parking and a mid-block paseo and central courtyard.
- Little Tokyo Business Incentive Program – This program provides financial assistance to business owners/tenants in the Little Tokyo area. It includes a façade improvement program and as well as a business loan program.
- Metropolis Project – Located on the southwest corner of 8th and Francisco Streets, this recently-approved development will add 2.8 million square feet of new condominium, office, hotel, and retail space.
- Grand Avenue Project – This project consists of a full-scale redesign of Grand Avenue as well as the addition of a 16-acre park in the Civic Center.

- Angelus Plaza Project – This project involves renovation of all units in the Angelus Plaza senior housing project. It will renovate over 1,000 affordable housing units on the site.

- Central Avenue Art Park - Development of a community park on City-owned surface parking lots, adjacent to the First Street Historic District, Geffen Museum of Contemporary Art (MOCA), Japanese American National Museum (JANM), and the Go For Broke Foundation.

- New Genesis Apartments - This affordable housing project includes efficiency residential units as well as ground-floor commercial retail space and supportive services offices, replacing the existing Genesis Hotel with new construction.

- Los Angeles Sports and Entertainment District/L.A. Live! – Large portions of this project are open as of this writing, but some are still under development. This project creates a major sports and entertainment destination just south of the Financial District, surrounding the existing Los Angeles Convention Center and Staples Center. Additional auditoriums and theaters, as well as retail and office space, have recently been added. Condominium and rental apartment buildings are presently under construction. This redevelopment project is located one block south of the project area, within one-quarter mile of the Pico Avenue on the Metro Blue and Expo Lines. The Regional Connector LRT alternatives directly connect the Metro Gold Line and Eastside Expansion lines to the complex.

- Downtown Women's Center Relocation/Expansion – This project will remove the existing Downtown Women's Center on San Pedro Street between 4th and 5th Streets in order to make way for The Medallion. The City will renovate its Renaissance Building as the new Women's Center, and will provide an additional 75 permanent housing units and eight day rest beds for homeless women. CRA is currently reviewing development plans for the relocation/expansion project.

- Residential Hotels Rehabilitation Program – Under this plan, CRA will acquire approximately 30 single-room occupancy hotels, lease them to non-profit housing operators, and preserve the units as low-income housing. CRA cites public ownership as a means of cleaning up crime-ridden slum hotel areas within the project area.

Additionally, CRA is preparing development plans for the Central Industrial District, located in the southeast portion of the project area. The City does not have any Specific Plan areas within the project area; however there are three in the downtown area that border the project area:

- Alameda District (North of the project area) covers Union Station and the surrounding parcels.
- Los Angeles Sports and Entertainment District (South of the project area) includes the L.A. Live development, Staples Center, the Convention Center, and surrounding parcels slated for high-density development.
- Central City West (West of the project area) covers the area immediately west of the 110 freeway.

6.3 Air Quality and Environmental Sustainability

The City is one of the most congested metropolitan areas in the nation and has been designated as a federal non-attainment area for air quality. The growing concern over global climate change and poor air quality is a predominant concern for Southern California. The use of fossil fuels for transportation generates large amounts of carbon dioxide (a greenhouse gas) emissions, which continue to disrupt progress toward improved air quality. Vehicle-related emissions account for over one-third of all air pollutants in the County (SCAG 2006).

During the 1990s, the County saw a significant increase in transit use. In 2002, SCAG reported that the City ranked 7th in the nation in public transit usage (SCAG 2002). These changes are due in large part to investments in the regional public transportation system.

Investments in public transportation can contribute to alleviating the air quality challenges faced by the region and mitigating the negative effects suffered by Southern California residents. The Regional Connector will contribute to improved mobility by increasing the speed and convenience of the rail system, thereby providing a more viable alternative to the automobile. As a result, projected degradation of air quality will be reduced (at a minimum) or reversed (at a maximum) through reduced automobile-related greenhouse gas emissions in the region.

6.4 Travel Demand and Patterns

Historic growth patterns have resulted in a multi-centered region with multiple transportation corridors converging in the project area. The transportation network includes 9,000 lane-miles of freeway, more than 42,000 lane-miles of arterials, and several large public transit service providers (SCAG RTP 2004). Yet growth of the transportation system has not kept pace with population growth and increases in transportation demand. As the population in the region doubled from 1960 to 2000, highway miles increased by less than 30 percent (SCAG RTP 2004). The congestion caused by insufficient transportation lanes affects both personal travel and goods movement. The majority of the congestion is from travel on the highways and local arterial network regardless of transportation mode. If the current trend persists, travel delays are expected to rise to 5.4 million person hours by 2035, more than

double currently experienced delays, which will deeply affect highway productivity (SCAG PEIR 2004). Expanding the public transportation system will provide more choices for commuters and potentially reduce travel demand and patterns on major highway and arterial systems.

The project area is at the central core of activity for the County. The project area is ranked very high as a destination zone for people coming from outside of the project area. For instance, over 50,000 daily trips (approximately 25 percent of external trip destinations) are made for work from the greater Eastside, to Central Los Angeles. The Central Business District (CBD) is also one of the top attractors of trips from the Westside. In 2006, of the more than 53,000 daily person trips from the project area to other parts of Central Los Angeles, 11,000 were on public transit.

Among passengers riding on the Metro Gold Line from Pasadena to Union Station, nearly three-quarters transfer to the Metro Red Line for continued service into other parts of the City. Figures 1-36 and 1-37 illustrate travel patterns to and from the project area.

6.5 Summary of Public Transit Markets

The project area is located in the crossroads of the region's transportation system because of historic development and population growth patterns. It contains the highest concentration of jobs in the County. Improving access to and through the project area is a vital part of a larger strategy for meeting the economic, social, and environmental goals of the region.

Areas with large and growing populations represent a large public transit market because of high travel demands on already-congested public transit, roads, and freeways. As described in Section 1.8.4, the total population in the project area is projected to increase by almost 16 percent by 2035, increasing the population density. High population densities can increase potential ridership on public transit.

Increasing economic development and employment opportunities in the project area also increases the size of the public transit market. Employment is expected to increase by about 7 percent by 2035. This will increase demands for public transit from commuters wishing to avoid travel in private vehicles during peak traffic hours on roads and freeways.

Improving public transit connectivity in the project area offers opportunities to increase ridership through access to regional transit markets. Balanced local land use and transportation policies can reduce auto travel and support more pedestrian-friendly, mixed-use and transit-oriented developments throughout the region.

Public transit provides an alternative means of personal mobility, supports increases in demands to alternatives to private transportation, and contributes to improving the quality of life in metropolitan communities.

Transit facilities, services and centers are best when they are customer-friendly, community-oriented and well-designed. A network of transit-based centers and corridors, supported by in-fill development, maximizes the use of existing infrastructure, supports transit ridership, reduces automobile air pollution and preserves natural areas. These improvements will help improve the region's economic vitality, quality of life, and environment.

7.0 GOALS AND OBJECTIVES

Based on the project purpose, Metro developed evaluation criteria. Metro applied the following goals and objectives in evaluating potential alternatives for the Regional Connector Corridor Project. These goals and objectives reflect Metro's mission to meet public transportation and mobility needs for transit infrastructure while also being a responsible steward of the environment and being considerate of affected agencies and community members when planning a fiscally responsible project.

Transportation goal:

- Improve mobility and accessibility both locally and regionally – Develop an efficient and sustainable level of mobility within Los Angeles County to accommodate planned growth and a livable environment

- Improve regional system functionality by minimizing transfers, improving travel times, maximizing ridership, and increasing transit accessibility

Environmental goal:

- Support efforts to improve environmental quality – Develop a project that minimizes adverse environmental impacts while providing environmental benefits, including providing air quality benefits

Land use goal:

- Support community planning efforts – Support the progression of the regional center area as an integrated destination and a dynamic livable area accommodating project growth in a sustainable manner

- Support adopted land use and transportation plans

Implementation goal:

- Provide a safe and secure alternative transportation system – Develop a project that is safe for riders, pedestrians, and drivers while meeting region's need for security

- Support public involvement and community preservation – Incorporate the public in the planning process and balance the benefits and impacts while preserving communities in the area, such as Little Toyko, the Arts District, Bunker Hill, Civic Center, and the Historic District

Financial goal:

- Provide a cost effective transportation system – Develop a project that provides sufficient regional benefits to justify the investment

- Achieve a financially feasible project – Develop a project that maximizes opportunity for funding and financing that is financially sustainable

8.0 CONCLUSIONS

The purpose of this project is to improve the region's public transit service and mobility by connecting the light rail service of the Metro Gold Line to the Metro Blue Line and the Metro Expo Line. This link would serve communities across the region, allowing greater accessibility while serving population and employment growth in downtown Los Angeles.

In addition to mobility benefits, the location of the Regional Connector project has the potential to improve the livability of the entire Los Angeles County region. Improved mobility to and through downtown Los Angeles has the potential to boost economic development and improve social justice by providing better access to employment. Improved transit connectivity will increase transit ridership which will also generate environmental benefits through reduced vehicle trips and less roadway congestion. The Regional Connector project sits at an ideal location where the region could realize tremendous benefits.

Since the completion of studies on the Metro Blue Line to Pasadena performed in 1993 and 1994, the Metro Rail system has grown substantially, with rail lines in operation and under construction extending over 80 track-miles within Los Angeles County. Currently, the Metro Red and Metro Purple subway lines serve as an interim connection between the Metro Blue Line at 7th Street/Metro Center and the Metro Gold Line at Union Station, but the transfers involved are time-consuming, contribute to crowding on the subway platforms and trains, and may dissuade passengers from riding. This may become more noticeable as the newly opened Metro Gold Line Eastside Extension (2009) becomes more widely used as well as when the Metro Expo Line opens in 2011, as it will share the Blue Line tracks at 7th Street/Metro Center Station and add to existing crowds.

The Regional Connector will improve service for communities locally and across the region, allowing greater mobility and accessibility while supporting the revitalization of downtown. New stations will provide greater coverage of the downtown area, thus enhancing the convenience of the existing rail and bus system.

1.0 SUMMARY

Projects receiving federal funding must be reviewed for potential impacts to minority and low-income communities. Executive Order 12898 enacts this federal requirement regarding environmental justice. Other communities of concern include the elderly and communities of limited English proficiency (LEP). Given that the Regional Connector Transit Corridor project area is primarily comprised of minority and low-income communities, the potential exists for disproportionate adverse impacts to these communities.

In general, the build alternatives would provide greater regional connectivity and additional light rail transit in or adjacent to predominantly minority and low-income areas. Increased regional connectivity would have a beneficial impact to minority communities in regards to job and recreation access. In addition, the reduced number of transfers would result in travel time benefits for all transit riders, including low-income and transit dependent populations. These results would be consistent with Metro's policies as presented in the 2009 *Long Range Transportation Plan* (LRTP) and meet the criteria of the Federal Transit Administration's (FTA) *Title VI Circular*.

Public outreach to minority, low-income, and LEP populations in the project area has been extensive and comprehensive. In addition to standard scoping meetings and public hearings, stakeholder meetings have been conducted. A Little Tokyo Working Group (LTWG) was formed to oversee specific concerns of residents and business owners in Little Tokyo. In addition, per the LTWG's request, Metro is funding an independent contractor to review the draft environmental impact statement (EIS) and environmental impact report (EIR) and to help the Little Tokyo community understand and formulate mitigations where appropriate. This contractor will provide insight on potential environmental justice issues, particularly during construction, and will represent LTWG's concerns regarding impacts and mitigations. Appendix A is a letter from the Little Tokyo Community Council thanking Metro for their outreach to and work with the community for developing the Fully Underground LRT Alternative – Little Tokyo Variation 1 in response to community concerns.

The alternatives under consideration for the Regional Connector are: the No Build Alternative, the Transportation System Management (TSM) Alternative, the At-Grade Emphasis Light Rail Transit (LRT) Alternative, the Underground Emphasis LRT Alternative, the Fully Underground LRT Alternative – Little Tokyo Variation 1, and the Fully Underground LRT Alternative – Little Tokyo Variation 2.

The No Build Alternative would only include transit investments already planned in the Metro *2009 Long-Range Transportation Plan* (LRTP). The No Build Alternative would maintain the current level of bus and rail transit access in the project area. The No Build Alternative would not result in increased regional connectivity of the light rail system. As a result, equitable access to jobs and services may not be available to low-income and minority populations in the project area (particularly Little Tokyo).

In addition, transfer costs (in terms of travel time) would remain the same. Traffic congestion throughout the region is anticipated to increase. Like automobile traffic, current transit services would be impacted by this congestion. This effect would occur throughout the project area and the Los Angeles region, and would not occur disproportionately in Little Tokyo. Therefore, the No Build Alternative would not result in direct, indirect, or cumulative disproportionate adverse impacts with respect to transit service equity.

The TSM Alternative would maintain local bus and rail transit in the project area and add new shuttle bus lines that would serve Little Tokyo and low-income communities in the project area. The TSM Alternative would not increase connectivity to regional mass transit as much as the build alternatives; therefore, low-income and minority populations in the project area may not have improved access to jobs and services. Traffic congestion throughout the region is anticipated to increase. Like automobile traffic, current transit services would be impacted by this congestion. This effect would occur throughout the project area and the Los Angeles region, and would not occur disproportionately in Little Tokyo. Therefore, the TSM Alternative would not result in direct, indirect, or cumulative disproportionate adverse impacts with respect to transit service equity.

The At-Grade Emphasis LRT Alternative would extend light rail tracks from the underground 7th Street/Metro Center Station to the Metro Gold Line at a 3-way junction north of the Little Tokyo/Arts District Station on Alameda Temple Streets. This alternative would not reduce the existing bus network in the project area. Beneficial impacts to transit equity would be anticipated.

Increased regional connectivity would reduce transit transfers and travel time. This would result in benefits to all transit riders, including minority and low-income communities. Increased regional connectivity would add access to major employment centers, including all civic employers downtown. Little Tokyo could suffer the following disproportionate adverse impacts under this alternative: parking loss, access to public facilities during operations, safe pedestrian crossing for residents and visitors, and construction-related impacts. Mitigation measures would address these concerns so that the project would result in no disproportionate adverse impacts.

The Underground Emphasis LRT Alternative would extend north from the 7th Street/Metro Center Station along Flower Street, travel east under 2nd Street, and emerge at an at-grade connection just southwest of the intersection of 1st and Alameda Streets. This alternative would not reduce the existing bus network in the project area. Beneficial impacts to transit equity would be anticipated.

Increased regional connectivity would reduce transit transfers and travel time. This would result in benefits to all transit riders, including minority and low-income communities. Increased regional connectivity would add access to major employment centers, including all civic employers downtown. Little Tokyo could suffer the following disproportionate adverse impacts under this alternative: parking loss, access to public facilities during operations, safe pedestrian crossing for residents and visitors, and construction-related impacts. Mitigation measures would address these concerns so that the project would result in no disproportionate adverse impacts.

Fully Underground LRT Alternative – Little Tokyo Variations 1 and 2 would extend north from the 7th Street/Metro Center Station along Flower Street then travel east under 2nd Street and under the intersection of Alameda Street and 1st streets. From there, tracks would emerge at an at-grade connection to the existing Metro Gold Line, north and east of intersection of Alameda and 1st Streets. These alternatives would not reduce the current bus system in the project area. Beneficial impacts to transit equity would be anticipated.

Increased regional connectivity would reduce transit transfers and travel time. This would result in benefits to all transit riders, including minority and low-income communities. Increased regional connectivity would add access to major employment centers, including all civic employers downtown.

Little Tokyo could suffer the following disproportionate adverse impacts under this alternative: parking loss during construction, access to public facilities during operations, safe pedestrian crossing for residents and visitors, and construction-related impacts. Mitigation measures would address these concerns so that the project would result in no disproportionate significant adverse impacts. The Little Tokyo Community Council (LTCC) has written to Metro to indicate that it supports the Fully Underground Variation 1 Alternative as being most consistent with community needs while addressing community concerns.

The California Environmental Quality Act (CEQA) does not contain thresholds of significance specific to environmental justice. CEQA does, however, contain criteria applicable to low-income communities. None of the proposed alternatives would displace affordable housing thus necessitating construction of replacement housing elsewhere. Project alternatives would not result in any significant impacts under a CEQA analysis. Consequently, no mitigation measures under CEQA are considered.

2.0 INTRODUCTION

Environmental justice deals with potentially disproportionate impacts to minority and low-income communities. This section describes key socioeconomic indicators in the project area that influence the assessment of environmental justice concerns. This memo discusses federal and state environmental justice regulations and provides a comparative demographic profile of the region, project area and proposed stations areas. In addition, this analysis includes a summary of outreach made to communities sensitive to environmental justice concerns. This memo concludes with an assessment of potential disproportionate adverse impacts to minority, low-income, elderly, and LEP communities.

3.0 METHODOLOGY FOR IMPACT EVALUATION

3.1 NEPA Guidelines

3.1.1 Federal Regulation

On February 4, 1994, President Bill Clinton signed Executive Order 12898*, Federal Actions to Address Environmental Justice in Minority Populations and Low-Income Populations*. Executive Order 12898 requires federal agencies to seek environmental justice by "identifying and addressing social and economic effects of... programs, policies, and activities on minority populations and low-income populations in the United States" (Federal Register, Volume 59, Number 32). Executive Order 12898 seeks fair treatment and meaningful involvement of all people regardless of race, color, national origin, or income with respect to the development, implementation, and enforcement of environmental laws, regulations, and policies.

Fair treatment means that no group of people, including a racial, ethnic, or socioeconomic group, should bear a disproportionate share of negative environmental consequences resulting from industrial, municipal, or commercial operations or policies. Meaningful involvement means that potentially affected community residents have an appropriate opportunity to participate in decisions about a proposed activity that will affect their environment and/or health; that the public's contribution can influence the regulatory agency's decision; that the concerns of all participants will be considered in the decision making process; and, that decision-makers will seek out and facilitate the involvement of those potentially affected.

In response to Executive Order 12898, the U.S. Department of Transportation (USDOT) issued the *Order to Address Environmental Justice in Minority Populations and Low-Income Populations* (Federal Register Volume 62, Number 72). This order, issued in April 1995, sets guidelines to ensure that all federally-funded transportation-related programs, policies, or activities that have the potential to adversely affect human health or the environment involve a planning and programming process that explicitly considers effects on minority and low-income populations. As a result of Executive Order 12898, the National Environmental Policy Act (NEPA) requires projects that receive federal funding to engage in an analysis of environmental justice concerns.

Executive Order 13166 requires programs funded by the federal government to develop and implement a system to provide meaningful access for LEP populations as part of their creation. Executive Order 13166 has a two-fold purpose. First, it provides enforcement and implementation of an existing obligation under Title VI of the Civil Rights Act of 1964. Title VI prohibits recipients of federal financial assistance from discriminating based on national origins, such as by failing to provide meaningful access to LEP individuals.

Secondly, Executive Order 13166 sets forth a new obligation that requires all federal agencies to meet the same standards as federal financial assistance recipients. Thus, federal agencies must provide meaningful access to LEP individuals as a part of federally conducted programs. Additionally, each federal agency must develop a plan to provide this access. Meaningful access can include availability of vital documents, printed and internet-based information in one or more languages, and translation services during public meetings that can be part of an official language assistance plan (LAP).

The Age Discrimination Act of 1975 prohibits discriminating against individuals based on age. It prohibits a federally funded program from denying meaningful access or participation to any certain age group.

3.1.2 State and Local Regulation

Following the lead of the federal government, California enacted a series of laws to implement environmental justice, starting in 1999. The Governor's Office of Planning and Research (OPR) has been designated the agency in state government for coordinating environmental justice programs. As part of its new environmental justice coordinator role, OPR must incorporate environmental justice considerations into local government planning decisions. California law requires OPR to coordinate with federal agencies regarding environmental justice and to consider Executive Order 12898.

Metro adopted guidelines and planning policies regarding environmental justice issues in its 2009 Long Range Transportation Plan (LRTP). Metro's 2009 LRTP discusses potential provision of additional transit service in areas with high transit dependency and minority and low-income populations. The 2009 LRTP includes extensive transit investments. The LRTP includes policies sensitive to investment in areas with minority and lower-income populations. The LRTP also discusses investing in transit to support job opportunities for residents in these areas. In addition, Metro files a Title VI compliance report every year.

3.2 CEQA Guidelines

Neither the CEQA statute nor its implementing guidelines refer specifically to the topic of environmental justice. CEQA focuses on identifying and disclosing potential significant impacts to the physical environment, and socioeconomic effects are of secondary importance. CEQA does, however, place major emphasis on the disclosure of environmental changes to all potentially affected communities regardless of socioeconomic status. CEQA recognizes in its guidelines that displacement of a substantial number of affordable housing units would constitute a significant environmental impact and necessitate building replacement housing.

3.3 Methodology

In assessing a transit improvement project's compliance with Executive Orders 12898 and 13166 regarding environmental justice and LEP populations there are three major considerations:

- Whether the project provides transit service equity
- Whether any potential adverse impacts during either construction or operations of the project would be disproportionately borne by low-income and minority communities
- Whether low-income and minority communities have had opportunities to actively participate in the planning of the project in a manner to shape route alignment alternatives, design elements, or other project features that would minimize or avoid impact to their community

This analysis used data from the 2005 to 2007 *American Community Survey (*ACS) by the Census Bureau for population and housing estimates. It used data from the 2000 United States (U.S.) Census

for most demographic and socioeconomic estimates. Although these data are almost ten years old, they are the most comprehensive available. The ACS did not update most demographic or socioeconomic data. This analysis supplemented 2000 U.S. Census Data for the Little Tokyo area with updated demographics provided by the Little Tokyo Service Center.

Consistent with Title IV of the Civil Rights Act of 1964, the USDOT defines "minority" as shown in the following table.

Black	a person having origins in any of the black racial groups of Africa
Hispanic	a person of Mexican, Puerto Rican, Cuban, Central or South American, or other Spanish culture or origin, regardless of race
Asian	a person having origins in any of the original peoples of the Far East, Southeast Asia, or the Indian subcontinent
American Indian	a person having origins in any of the original people of North America and who maintains cultural identification through tribal affiliation or community recognition
Native Hawaiian or other Pacific Islander	a person having origins in any of the original peoples of Hawaii, Guam Samoa, or other Pacific Islands

The Federal Highway Administration (FHWA) uses a definition from Title IV of the Civil Rights Act of 1964 to define a "low-income" person as a person whose household income (or in the case of a community or group, whose median household income) is at or below the U.S. Department of Health and Human Services (HHS) poverty guidelines.

HHS poverty guidelines simplify poverty thresholds established by the U.S. Census Bureau. The U.S. Census Bureau uses poverty thresholds primarily in statistical analyses. This analysis used these guidelines as the basis for determining low-income and poverty characteristics.

Table 3-1 shows HHS Thresholds.

Table 3-1. 2000 U.S. Census Poverty Thresholds

Household Size	Income Threshold
One-Person	$8,794.00
Two-Person	$11,239.00
Three-Person	$13,738.00
Four-Person	$17,603.00
Five-Person	$20,819.00
Six-Person	$23,528.00
Seven-Person	$26,754.00
Eight-Person	$29,701.00
Nine-Person	$35,060.00

Source: U.S. Census Bureau, Housing and Household Economic Statistics Division, 2000

4.0 AFFECTED ENVIRONMENT

The proposed project would be located in downtown Los Angeles. However, the proposed project would result in a region-wide, beneficial impact because it would connect most of the rail system in Los Angeles County. Therefore, the affected environment includes the entire region.

4.1 Areas of Potential Impact

4.1.1 County of Los Angeles

Table 4-1 shows certain characteristics of Los Angeles County. As of 2007, approximately 9.9 million persons reside in the County, living in approximately 3.4 million housing units. Approximately 69 percent of the County population is characterized as minority. The largest minority population is Hispanic, making up approximately 45 percent of the total population.

According to the 2000 U.S. Census, approximately 18 percent of households in the County live below the poverty level. LEP persons over the age of five make up 16 percent of Los Angeles County. Of this 16 percent, 12 percent speak only Spanish. The elderly (age 65 and older) make up 9.7 percent of county population. Los Angeles County has an unemployment rate of 12.5 percent (Bureau of Labor Statistics 2009).

4.1.2 City of Los Angeles

Table 4-1 shows certain characteristics of the City of Los Angeles (City). As of 2007, approximately 9.9 million persons reside in the City, living in approximately 3.4 million housing units. Approximately 53 percent of the City's population is characterized as minority. The largest minority population is Hispanic, making up approximately 47 percent of the population. According to the 2000 U.S. Census, approximately 22 percent of households live below the poverty level.

LEP persons over the age of five make up 33 percent of City population. Of this 33 percent, 25 percent speak only Spanish. The elderly (age 65 and older) make up 9.7 percent of City population. The City of Los Angeles has an unemployment rate of 11.7 percent (Bureau of Labor Statistics July 2009).

4.1.3 Project Area

The project area is located entirely within the City of Los Angeles. For the purposes of the environmental justice analysis, the project area contains the following census tracts: 2060.30, 2060.40, 2062, 2073, 2074, 2075, and 2077.10 (see Figure 4-1). The project area houses approximately 18,070 persons, living in 10,340 housing units (see Table 4-2). Minorities make up 83 percent of project area, and approximately 40 percent of the population lives below the poverty level.

Table 4-1. Summary of Characteristics for Los Angeles County and the City of Los Angeles

Characteristic	County of Los Angeles	City of Los Angeles
Total Population (persons) (2007) /a/	9,878,554	3,834,340
Total Housing Units(2007) /a/	3,374,211	1,356,808
Percent population below poverty level (2000) /b/	18%	22%
Median Household income (2000) /b/	$42,189	$36,687
Percent Minority (2000) /b/	69%	53%
Percent Limited English Proficiency, Age ≥ 5 (2000) /b/	16%	33%
Percent of Population over 65 years of Age (2000) /b/	9.7%	9.7%
Unemployment Rate (2009) /c/	12.5%	11.7%

Source: U.S. Census Bureau, 2000 and 2005-2007; Bureau of Labor Statistics, 2009
Notes:
/a/ From the 2005-2007 ACS.
/b/ From the 2000 U.S. Census, Summary File 3.
/c/ From Bureau of Labor Statistics.

The project area contains the communities of Little Tokyo, the Arts District, Boyle Heights, Bunker Hill, Historic Core, Financial District, Toy District, and South Park. Many of these communities contain historic resources, but the communities themselves have undergone significant changes in demographics and character. Most of the communities are predominantly minority and/or low-income. The most visible and concentrated minority community in the project area is Little Tokyo.

The project area is surrounded by predominantly minority and low-income neighborhoods such as South Los Angeles, Pico-Union, Westlake-MacArthur Park, Chavez Ravine, Lincoln Heights, and Chinatown. This analysis treated potential environmental justice impacts to Little Tokyo with special attention given its historical and cultural importance. Furthermore, construction activities would impact Little Tokyo under all build alternatives.

Table 4-2. Summary of the Project Area Characteristics

Characteristic	Value
Total Population (persons) /a/	18,067
Total Housing Units	10,339
Percent Population Below Poverty Level	39%
Percent Minority	83%

Note:
/a/ Excludes homeless population.

4.1.3.1 Census Tract 2060.30

Census tract 2060.30 is located in the eastern-most part of the project area. Census tract 2060.30 is bounded by Alameda Street on the west, 1st Street on the south, Pleasant Avenue on the east, and US 101 on the north (see Figure 4-1). Census tract 2060.30 includes parts of both Little Tokyo and Boyle Heights. Census tract 2060.30 is characterized by one and two-story buildings. Major corridors in this tract are Alameda Street, 1st Street, and Mission Road. Census tract 2060.30 is primarily industrial/commercial west of the Los Angeles River and residential east of the Los Angeles River. Bus lines serving this area run primarily on 1st Street. The Metro Gold Line Little Tokyo/Arts District Station is located in this tract.

4.1.3.2 Census Tract 2060.40

Census tract 2060.40 is located in the eastern-most part of the project area. Census tract 2060.40 is bounded by State Street on the east, 4th Street on the south, Alameda Street on the west, and 1st Street on the north (see Figure 4-1). Census tract 2060.40 includes the Arts District and part of Boyle Heights. Census tract 2060.40 is characterized by one and two-story buildings. Major corridors in this area are Alameda Street, 1st Street, 4th Street, and Mission Road. Census tract 2060.40 has a mix of residential, commercial, and light industrial uses. Bus transit serving this tract runs primarily on 1st Street. The Metro Gold Line Little Tokyo/Arts District Station is located adjacent to this Census tract.

4.1.3.3 Census Tract 2062

Census tract 2062 is located in the eastern-most part of the project area. Census tract 2062 is bounded by Alameda Street on the east, 5th Street on the south, Los Angeles Street on the west, and 1st Street and Temple Street on the north (see Figure 4-1). Census tract 2062 includes Little Tokyo, part of the Toy District, and part of Skid Row. Census tract 2062 is characterized by tall, multi-story buildings north of 3rd Street and smaller one and two-story buildings south of 3rd Street. Major corridors in this area are Alameda Street, 1st Street, 2nd Street, and Central Avenue. Census tract 2062 has a mix of residential, commercial, and light industrial uses. Bus transit serving tract 2062 runs primarily on 1st and Temple Streets. The Metro Gold Line Little Tokyo/Arts District Station is located adjacent to this tract.

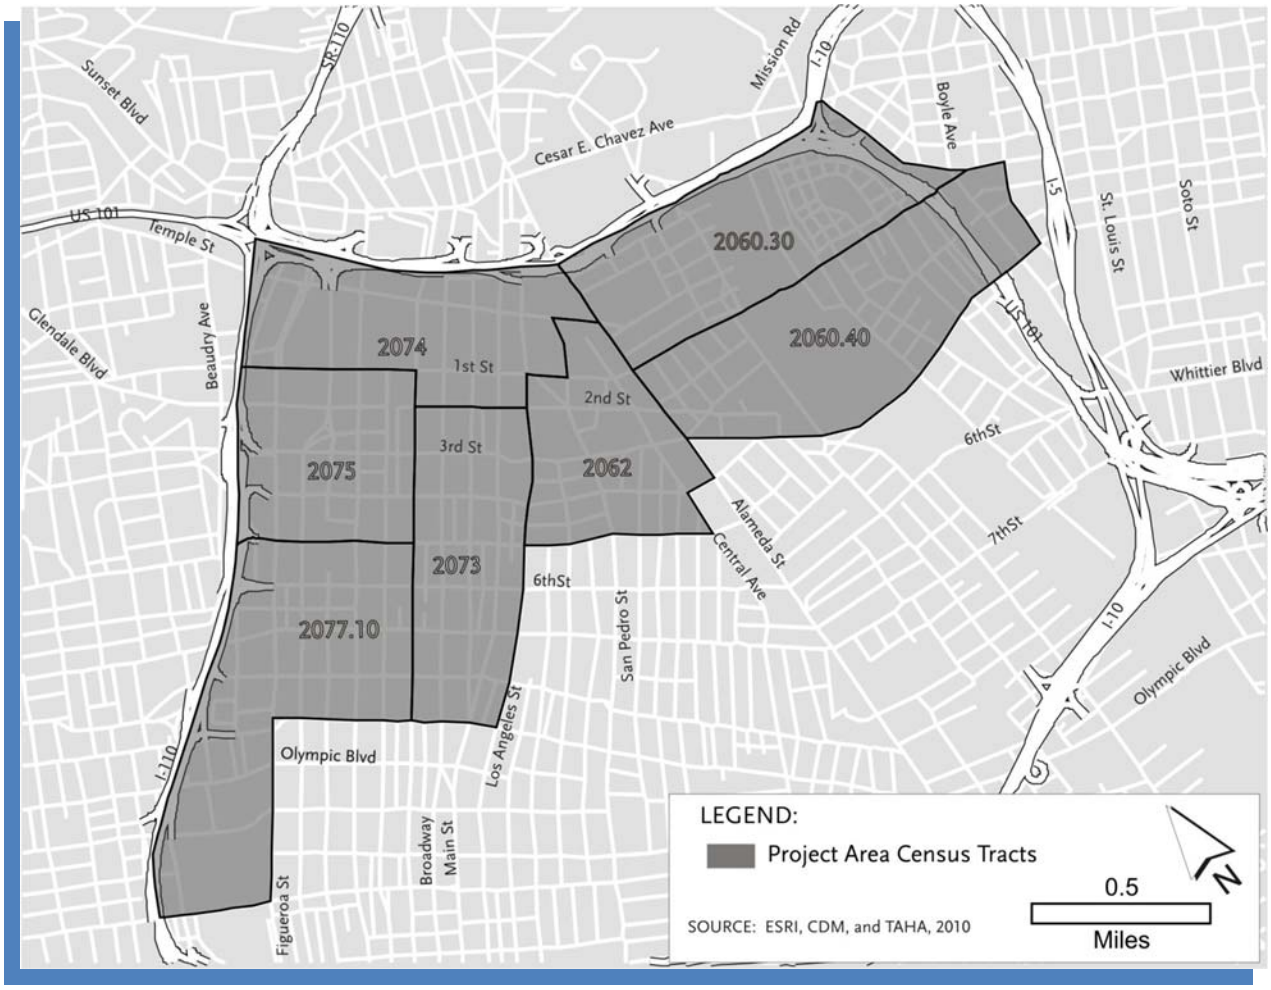

Figure 4-1. Project Area

4.1.3.4 Census Tract 2073

Census tract 2073 is bounded by Los Angeles Street on the east, 9th Street on the south, Hill Street on the west, and 2nd Street on the north (see Figure 4-1). Census tract 2073 includes the Historic Core, a portion of the Fashion District, and a portion of Skid Row. Census tract 2073 is characterized by tall, multi-story buildings. Major corridors in this area are Hill Street, Broadway, Spring Street, and Main Street. Census tract 2073 has a mix of residential, institutional, and commercial uses. Bus transit serving this tract runs along all major corridors. The Metro Pershing Square Station is located within census tract 2073.

4.1.3.5 Census Tract 2074

Census tract 2074 is bounded by Alameda Street, Judge John Aiso Way, and Los Angeles Street on the east, 1st and 2nd Streets on the south, State Route (SR) 110 on the west, and US 101 on the north (see Figure 4-1). Census tract 2074 includes the Civic Center and is characterized by tall, multi-story buildings and parking lots. Major corridors in this area are Hill Street, Broadway, Spring Street, Main

Street, 1st Street and Temple Street. Census tract 2074 has institutional, entertainment, and commercial uses. Bus transit serving this tract runs along all major corridors. The Metro Civic Center Station is located within this tract.

4.1.3.6 Census Tract 2075

Census tract 2075 is bounded by Hill Street on the east, 5th Street on the south, SR 110 on the west, and 1st Street on the north (see Figure 4-1). Census tract 2075 includes the Bunker Hill District and a portion of the Financial District. Census tract 2075 is characterized by mid-rise and high-rise commercial office towers. Major corridors in this area are Figueroa Street, Grand Avenue, Flower Street, Olive Street, 3rd Street, 4th Street, and 5th Street. Census tract 2075 has a mix of residential, institutional, and commercial uses. Bus transit in this tract runs along all major corridors. The Metro Pershing Square and Civic Center Stations are located adjacent to census tract 2075.

4.1.3.7 Census Tract 2077.10

Census tract 2077.10 is bounded by Hill Street on the east, 9th Street and Pico Boulevard on the south, SR 110 on the west, and 5th Street on the north (see Figure 4-1). Census tract 2077.10 includes portions of both the Financial and South Park districts. Census tract 2077.10 is characterized by tall skyscrapers, other multi-story buildings, and large entertainment venues including the Staples Center, L.A. Live and the Los Angeles Convention Center.

Major corridors in this area are Figueroa Street, Flower Street, Grand Avenue, Olympic Boulevard, 7th Street, Wilshire Boulevard, and 6th Street. Census tract 2077.10 has a mix of residential and commercial uses. Bus transit in this tract runs along all major corridors. The 7th Street/Metro Center Station is located within census tract 2077.10.

4.2 Demographics of the Project Area

Table 4-3 shows that approximately 80 percent of the population in the project area belongs to a minority group. Hispanic or Latinos make up 35 percent of the population in the project area. Asians are the second largest minority group and make up 26 percent of the population. Whites and Blacks or African American populations make 19 percent and 17 percent of the population respectively. Figure 4-2 shows the demographic character of the project area. The demographic character of census tracts in the project area is as follows:

- Census Tract 2060.30. Census tract 2060.30 includes part of Boyle Heights. According to the 2000 U.S. Census, 92 percent of the census tract population is minority. The minority group with the largest representation is Hispanics or Latinos (78 percent).

- Census Tract 2060.40. Census tract 2060.40 includes the Arts District and part of Boyle Heights. According to the 2000 U.S. Census, 88 percent of the census tract population is minority. The minority group with the largest representation is Hispanics or Latinos (80 percent).

- Census Tract 2062. Census tract 2062 includes the community of Little Tokyo. According to the 2000 U.S. Census, 88 percent of the census tract population is minority. The minority

groups with the largest representation in census tract 2062 are Blacks or African Americans (36 percent), Asians (31 percent), and Hispanics or Latinos (19 percent).

- Census Tract 2073. According to the 2000 U.S. Census, 73 percent of the census tract population is minority. The minority groups with the largest representation 2073 are Blacks or African Americans (35 percent), Hispanics or Latinos (21 percent), and Asians (14 percent).

- Census Tract 2074. Census tract 2074 includes a resident population of seven persons and a population of approximately 1,100 persons in jails (institutionalized group-living in census terms. According to the 2000 U.S. Census, 68 percent of the population is minority. The minority groups with the largest representation are Blacks or African Americans (34 percent) and Hispanics or Latinos (29 percent).

- Census Tract 2075. According to the 2000 U.S. Census, 76 percent of the census tract population is minority. The minority groups with the largest representation in are Asians (52 percent) and Hispanics or Latinos (12 percent).

- Census Tract 2077.10. According to the 2000 U.S. Census, 90 percent of the census tract population is minority. The minority groups with the largest representation are Hispanics or Latinos (51 percent) and Asians (31 percent).

4.2.1 Little Tokyo Historic District

Little Tokyo is a commercial and residential district located in the northeastern portion of downtown Los Angeles. It has served as a Japanese community center for decades. Little Tokyo is one of three remaining "Japan Towns" in the United States (the other two are in San Francisco and San Jose). Before World War II, Little Tokyo was the largest Japanese-American community.

Little Tokyo once encompassed a larger area than today. Little Tokyo currently consists of the blocks bounded by Los Angeles Street to the west, Alameda Street to the east, 1st Street to the north, and 3rd Street to the South. Little Tokyo is adjacent to the Arts District, Civic Center, and the Toy District (see Figure 4-3). Little Tokyo is located within census tract 2062.

Little Tokyo has existed since the early 1900s and has included residential and commercial uses. During World War II and Japanese internment, Little Tokyo was abolished and renamed Bronzeville. Bronzeville was comprised primarily of African-Americans and Hispanics. Upon the return of interned Japanese, Little Tokyo was revitalized as a Japanese-American community, though not on a pre-war scale. In 1970, Little Tokyo was designated a redevelopment area by the Community Redevelopment Agency of the City of Los Angeles (CRA/LA).

With the assistance of the CRA/LA, Little Tokyo became the entry point for Japanese corporations into Southern California. Japanese business influence led to further changes in the social, political, physical, and economic environment of Little Tokyo. Little Tokyo was declared a National Historic Landmark in 1995 and a Preserve America Community in 2008.

Table 4-3. Project Area Demographic Character

Race/Ethnicity in Census Tract/Project Area (Persons)										
White	Black or African American	American Indian or Native Alaskan	Asian	Native Hawaiian & Pacific Islander	Other Race	Two or More Races	Hispanic or Latino	Total Minority	Largest Racial/Ethnic Group in Census tract	Percent of Census tract Population that is Minority

Source: U.S. Census Bureau, Summary File 3, 2000
Note:
/a/ Census tract 2074 has a single-family residential population of seven persons. It has an additional institutionalized group-living population of 1,087 persons. For demographic character of this Census tract, the institutionalized group-living population was included.

Although it has shrunk significantly in size, and most of the Japanese-American population has migrated to the suburbs, Little Tokyo remains the historical focal point for Japanese-Americans in the Los Angeles region. It is the home of the Japanese American Cultural and Community Center, the Japanese American National Museum (JANM), the Go For Broke Monument, and the Nisei Week festival. Little Tokyo is home to several religious institutions significant to the Japanese-American community including the Koyasan and Los Angeles Hompa Hongwanji Buddhist Temples. Little Tokyo has a large number of Japanese restaurants and other retail stores. Japanese businesses are particularly concentrated around the Japanese Village Plaza on the block bounded by 1st Street, Central Avenue, 2nd Street, and San Pedro Street.

According to the Little Tokyo Service Center (LTSC), the current population of Little Tokyo is approximately 2,300 persons. The demographic character of Little Tokyo is approximately 45 percent Japanese, 34 percent Korean, 5 percent Chinese, 4 percent Hispanic or Latino, 2 percent Black or African American, 1 percent other Asian, 8 percent White, and 1 percent other (LTSC 2009).

4.3 Socioeconomic Character of the Project Area

The project area is characterized by a diverse demographic. However, economically, the project area houses a mostly low-wage workforce. In 2000, the median household income in the project area was approximately $15,630 (see Table 4-4). The median household income in the project area is substantially lower than both the City's ($36,687) and the County's ($42,189). In the project area, 39 percent of the population lives below poverty thresholds defined in Table 4-1. Additionally, approximately 60 percent of the population has no access to a vehicle. Thus, the resident population is highly transit-dependent (see Table 4-4). The socioeconomic character of census tracts comprising the project area is as follows:

- Census Tract 2060.30. According to the 2000 U.S. Census, the median income for census tract 2060.30 is $24,821, which is substantially less than the median income for the City and County ($36,687 and $42,189 respectively). Thirty three percent of the population in census tract 2060.30 lives below the poverty level compared to 22 percent in the City and 18 percent in the County. 38 percent of the population of census tract 2060.30 is transit dependant.

- Census Tract 2060.40. According to the 2000 U.S. Census, the median income for census tract 2060.40 is $22,143, which is substantially less than the median income for the City and County ($36,687 and $42,189 respectively). Thirty six percent of the population in census tract 2060.40 lives below the poverty level compared to 22 percent in the City and 18 percent in the County. Thirty seven percent of the population of census tract 2060.40 is transit dependent.

- Census Tract 2062. Census tract 2062 includes the community of Little Tokyo. According to the 2000 U.S. Census, the median income for census tract 2062 is $10,959, which is substantially less than the median income for the City and County ($36,687 and $42,189 respectively). Fifty seven percent of the population in census tract 2062 lives below the poverty level compared to 22 percent in the City and 18 percent in the County. Seventy one percent of the population of census tract 2062 is transit dependent.

- Census Tract 2073. According to the 2000 U.S. Census, the median income for census tract 2073 is $8,125, which is substantially less than the median income for the City and County ($36,687 and $42,189 respectively). Forty eight percent of the population in census tract 2073 lives below the poverty level compared to 22 percent in the City and 18 percent in the County. Eighty five percent of the population of census tract 2073 is transit dependent.

- Census Tract 2074. Census tract 2074 includes a residential population of seven persons and a population of approximately 1,100 persons in jails (institutionalized group-living in census terms). This analysis used only the residential population. According to the 2000 U.S. Census, the median income for census tract 2074 is $6,250, which is substantially less than the median income for the City and County ($36,687 and $42,189 respectively). The entire resident population of census tract 2074 lives below the poverty level and is transit dependant.

- Census Tract 2075. According to the 2000 U.S. Census, the median income for census tract 2075 is $25,721, which is less than the median income for the City and County ($36,687 and $42,189 respectively). The median income is the highest of any census tract in the project area. Nineteen percent of the population in census tract 2075 lives below the poverty level compared to 22 for the City and 18 percent for the County. Forty two percent of the population of census tract 2073 is transit dependent.

- Census Tract 2077.10. According to the 2000 U.S. Census, the median income for census tract 2077.10 is $11,442, which is substantially less than the median income for the City and County ($36,687 and $42,189 respectively). Forty two percent of the population in census tract 2077.10 lives below the poverty level compared to 22 percent in the City and 18 percent in the County. Seventy six percent of the population of census tract 2077.10 is transit-dependent.

Notes:
/a/ Census tract 2074 has a single-family residential population of seven persons. It has an additional institutionalized group-living population of 1,087 persons. For socioeconomic character of this Census tract, the institutionalized group-living population was excluded.
/b/ Poverty status is based on thresholds as shown in Table 4-1.

4.3.1 Homeless Population

Downtown Los Angeles is home to a major homeless and transient population. The U.S. Census Bureau does not include homeless people in its population calculations. The Los Angeles Homeless Services Authority (LAHSA) conducts homeless counts in its jurisdiction. The project area encompasses part of Skid Row, a fifty-block area home to 5,130 homeless persons. This area is home to approximately seven percent of the homeless population of Los Angeles County (LAHSA, 2007).

The project area contains many shelters that serve homeless and transient populations. The area offers five shelters (some year-round), 14 single-room occupancy establishments (SROs), and nine homeless service providers. Resources for the homeless population within the project area shown in Table 4-5 and Figure 4-5.

Eight of 14 SROs are located in census tract 2062. Most are located at the southern boundary of the census tract in the central part of Skid Row. Five of nine service providers in the project are located in census tract 2073.

Figure 4-5. Location of Homeless Services in the Project Area and Skid Row

4.4 Age Distribution in the Project Area

Table 4-6 shows age distribution in the project area population. Residents in the age range of 35-49 make up 26 percent of the population. Approximately 25 percent of the project area population is 65 years or older (3,390 persons) compared to approximately 10 percent in the City and County. Figure 4-6 shows the age distribution in the project area. The age distribution in census tracts comprising the project area is as follows:

- Census Tract 2060.30. According to the 2000 U.S. Census, 4 percent of the population in census tract 2060.30 is elderly compared to 10 percent in the City and County. The age group most represented in census tract 2060.30 is age 22 to 34, which accounts for 31 percent of the population.

- Census Tract 2060.40. According to the 2000 U.S. Census, 13 percent of the population in census tract 2060.40 is elderly compared to 10 percent in the City and County. The age group most represented in census tract 2060.40 is age 35 to 49, which accounts for 21 percent of the population.

- Census Tract 2062. Census tract 2062 includes the community of Little Tokyo. According to the 2000 U.S. Census, 22 percent of the population in census tract 2062 is elderly compared to 10 percent in the County and City. The age group most represented in census tract 2062 is ages 35 to 49, which accounts for 40 percent of the population.

- Census Tract 2073. According to the 2000 U.S. Census, 20 percent of the population in census tract 2073 is elderly compared to 10 percent in the City and County. The age group most represented in census tract 2073 is ages 50 to 64, which accounts for 31 percent of the population.

- Census Tract 2074. According to the 2000 U.S. Census, Census tract 2074 does not have an elderly population. The age group most represented in census tract 2074 is ages 22 to 34, which accounts for 62 percent of the population.

- Census Tract 2075. According to the 2000 U.S. Census, 33 percent of the population in census tract 2075 is elderly compared to 10 percent in the City and County. This tract has the highest percentage of elderly residents of any in the project area.

- Census Tract 2077.10. According to the 2000 U.S. Census, 35 percent of the population in census tract 2077.10 is elderly compared to 10 percent in the City and County. The elderly are the best represented age group in this tract.

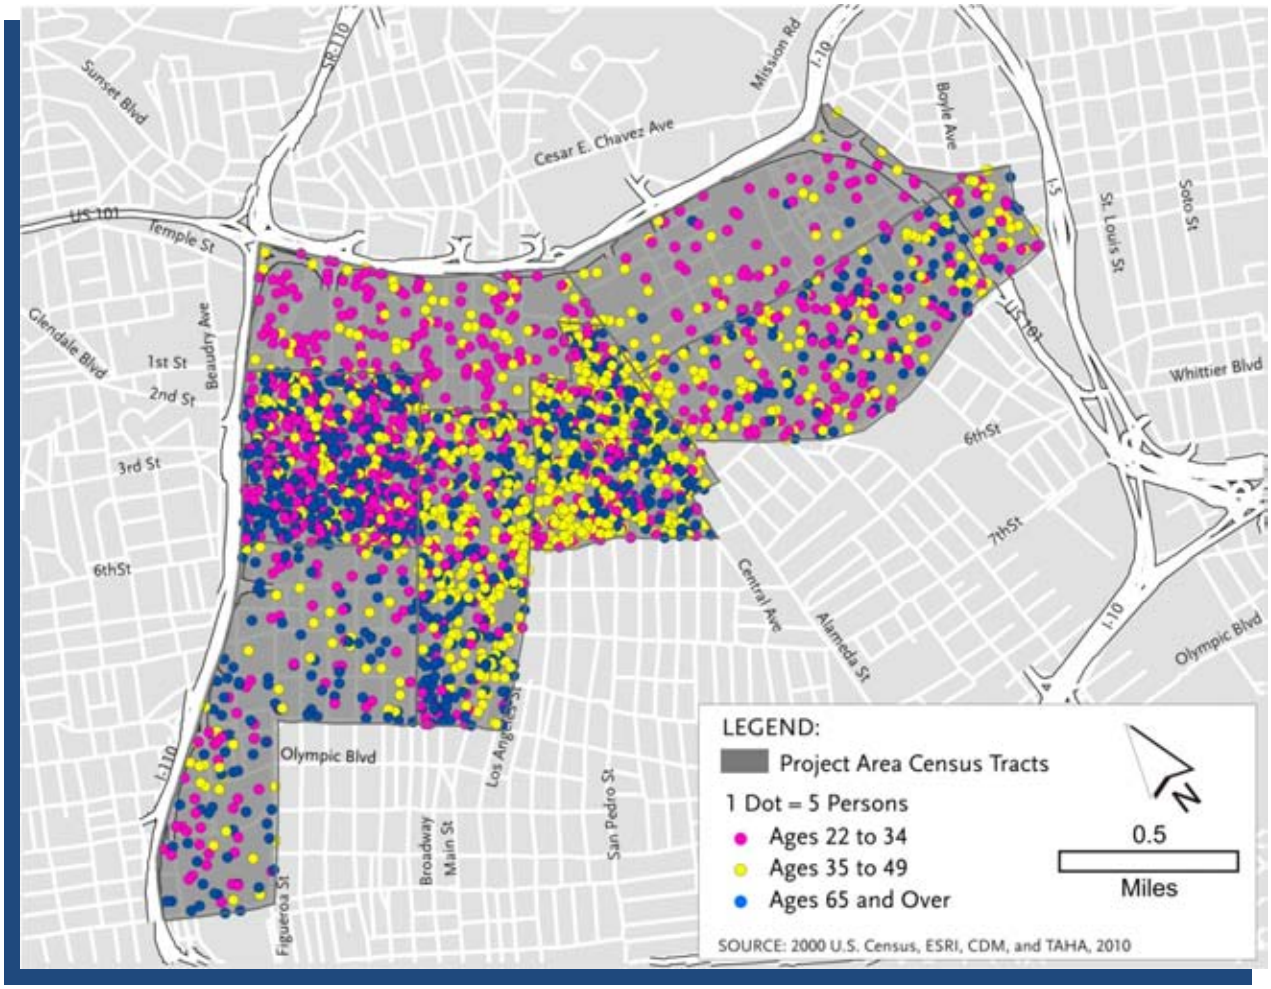

Figure 4-6. Age Distribution for Most Prominent Age Groups in the Project Area (Ages 22 to 34, 35 to 49, and 65 and Older)

4.5 Limited English Proficiency (LEP) Populations in the Project Area

Approximately 30 percent of households in the project area are linguistically isolated. This means that all members in the household over age five either speak English poorly or not at all. The percentage of LEP population in the project area is substantially higher than the County (16 percent) but lower than the City (33 percent).

Approximately 63 percent of the linguistically isolated population (1,804 persons) in the project area speaks an Asian or Pacific Island language. Approximately 35 percent (971 persons) speak Spanish. The geographic distribution of linguistically isolated households in the project area is shown in Figure 4-7. The LEP characteristic of each census tract in the project area is as follows (See Table 4-7):

- Census Tract 2060.30. According to the 2000 U.S. Census, 34 percent of households in census tract 2060.30 are linguistically isolated. The largest percentage of LEP households in this Census tract speak Spanish.

- Census Tract 2060.40. According to the 2000 U.S. Census, 42 percent of the households in census tract 2060.40 are linguistically isolated. The largest percentage of LEP households in this census tract speak Spanish.

- Census Tract 2062. Census tract 2062 includes the community of Little Tokyo. According to the 2000 U.S. Census, 42 percent of the households in census tract 2062 are linguistically isolated. The largest percentage of LEP households in this census tract speak an Asian or Pacific Island language.

- Census Tract 2073. According to the 2000 U.S. Census, 18 percent of the households in census tract 2073 are linguistically isolated. The largest percentage of LEP households in this census tract speak Spanish.

- Census Tract 2074. Census tract 2074 does not include any households that are linguistically isolated.

- Census Tract 2075. According to the 2000 U.S. Census, 31 percent of the households in census tract 2075 are linguistically isolated. The largest percentage of LEP households in this census tract speak an Asian or Pacific Island language.

- Census Tract 2077.10. According to the 2000 U.S. Census, 55 percent of the households in census tract 2077.10 are linguistically isolated). The largest percentage of LEP households in this census tract speak an Asian or Pacific Island language.

4.6 Public Participation

Executive Order 12898 requires meaningful public participation in the project development process. Meaningful involvement means that potentially affected community residents have an appropriate opportunity to participate in decisions about a proposed activity that will affect their environment and/or health, that the public's contribution can influence the regulatory agency's decision, that the concerns of all participants will be considered in the decision making process, and that the decision-makers will seek out and facilitate the involvement of those potentially affected.

In addition, Executive Order 13166 requires LEP persons be given meaningful access to the project development process. This would require providing materials and information in other languages as needed.

Table 4-7. Household Linguistic Isolation

Linguistically Isolated /a/				Not Linguistically Isolated /b/	Percentage of Census tract Households Linguistically Isolated	Language Spoken by Largest LEP Population in Census tract
Spanish	Asian/Pacific Island	Other Languages	Total			
Census tract 2060.30						
92	0	0	92	176	34%	Spanish
Census tract 2060.40						
408	64	0	472	652	42%	Spanish
Census tract 2062						
0	465	0	465	635	42%	Asian/Pacific Island
Census tract 2073						
258	244	44	546	2,406	18%	Spanish
Census tract 2074						
0	0	0	0	7	0%	N/A
Census tract 2075						
160	758	41	959	2,095	31%	Asian/Pacific Island
Census tract 2077.10						
53	273	0	326	264	55%	Asian/Pacific Island
Project Area						
971	1,804	85	2,860	6,235	31%	Asian/Pacific Island

Source: U.S. Census Bureau, Summary File 3, 2000
Note:
/a/ A linguistically isolated household is one in which no member 14 years old and over (1) speaks only English or (2) speaks a non-English language and speaks English "very well." In other words, all members 14 years old and over have at least some difficulty with English.
/b/ Non linguistically isolated households include households where members who speak another language other than English speak English well to very well.

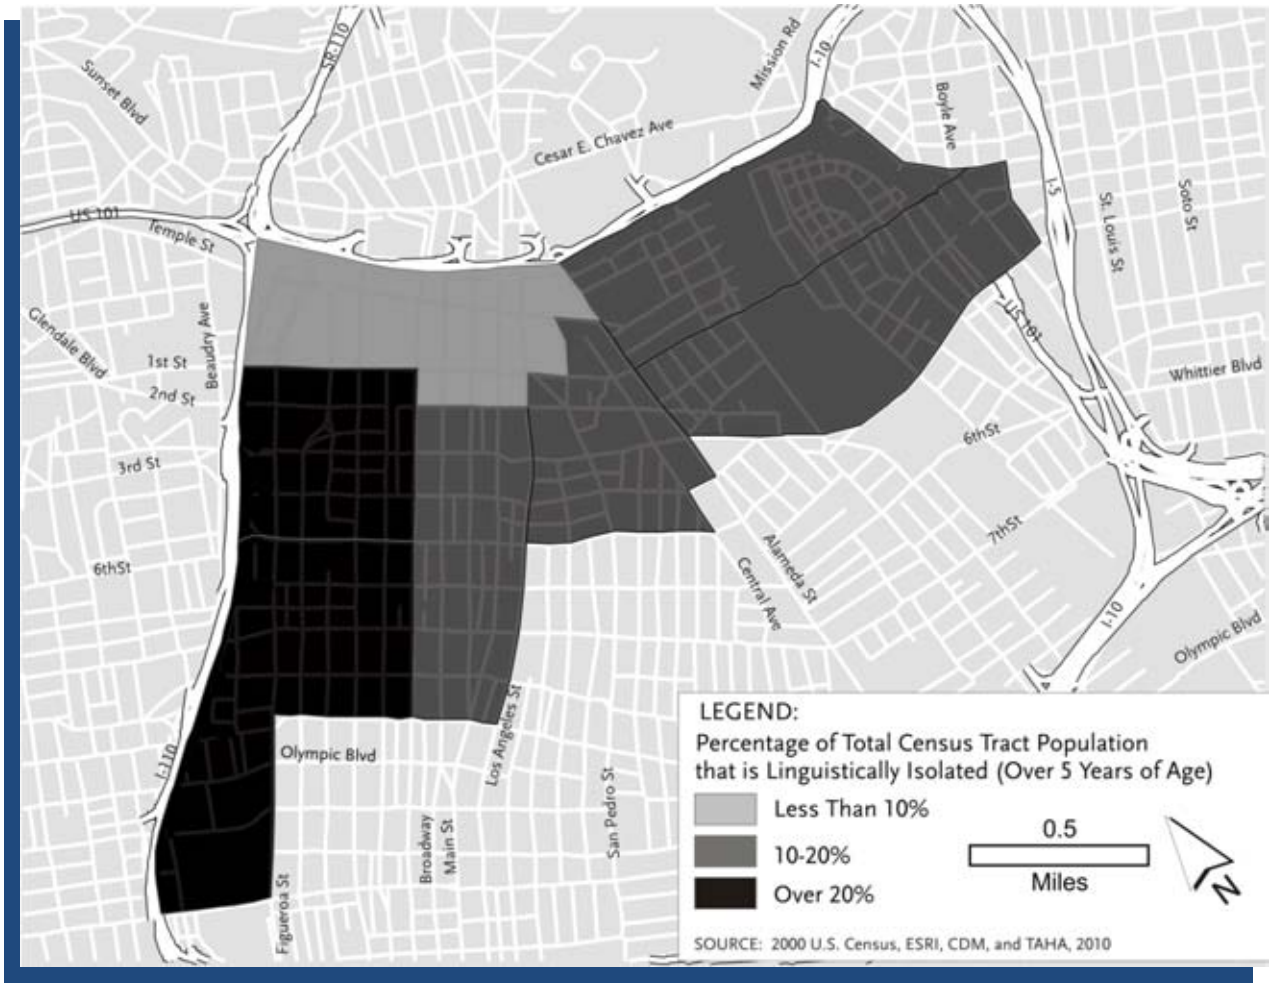

Figure 4-7. LEP Population Distribution in the Project Area

4.6.1 Alternatives Analysis Outreach

Metro has provided opportunities for public input since the beginning of the project development process. During the alternatives analysis (AA) phase of the project, Metro held two formal early scoping meetings as follows:

- November 6, 2007 – Los Angeles Central Library, Bunker Hill, Los Angeles
- November 7, 2007 – Japanese American National Museum, Little Tokyo, Los Angeles

One hundred seventeen persons attended these meetings, and Metro received 88 comments.

Metro presented a project update to the community on the following dates:

- February 26 and October 21, 2008 – Japanese American National Museum, Little Tokyo, Los Angeles
- February 28 and October 16, 2008 – Los Angeles Central Library, Bunker Hill, Los Angeles

One hundred and fourteen persons attended the February 2008 meetings, and 109 persons attended the October 2008 meetings. Metro received 57 comments from the February 2008 meetings and 51 comments from the October 2008 meetings.

Notices of these meetings were published in the *Los Angeles Downtown News* (English-language), *Los Angeles Garment and Citizen* (English/Spanish-language), and *Rafu Shimpo* (Japanese-language). Over 500 notices were mailed out with information about the meetings.

Metro held additional stakeholder meetings throughout the AA phase. Stakeholders include the LTCC, the LTSC, the Downtown Neighborhood Council, various Business Improvement Districts (BIDs), Bringing Back Broadway, and the Higgins Building Home Owners Association, among others.

4.6.2 Draft EIS/EIR Outreach

To ensure meaningful public participation during the project development process, Metro developed the Community Outreach and Public Participation Plan (PPP). The PPP includes policies relating to the following:

- Identifying stakeholders
- Establishing communication protocols
- Tracking public input
- Scheduling public involvement opportunities
- Generating publicity
- Identifying methods for disseminating information

The PPP is flexible and can be modified as public involvement progresses. The PPP reaches out to communities well beyond the proposed alignments, reflecting the region-wide impact this project could have.

Metro held four public scoping meetings. Metro gave notice of these meetings by sending 1,543 notices and 721 e-mails to residences and businesses in project area. Notices were published in the *Los Angeles Times*, *Daily Trojan*, *Pasadena Star News*, *Los Angeles Downtown News* (English-language), *Los Angeles Garment and Citizen* (English/Spanish-language), *La Opinión* (Spanish Language), and *Rafu Shimpo* (Japanese-language). The public scoping meetings were held as follows:

- March 30, 2009 – University of Southern California, South Los Angeles, Los Angeles
- March 31, 2009 – Lake Avenue Church, City of Pasadena

- April 1, 2009 – Japanese American National Museum, Little Tokyo, Los Angeles
- April 2, 2009 – Los Angeles Central Library, Bunker Hill, Los Angeles

Metro conducted public scoping meetings in an open house format, which allowed attendees the opportunity to review project information prior to the start of the presentation and comment period. Metro project team members attended the meetings to address public questions related to the project. Metro provided Spanish translators at all meetings and Japanese translators at the April 1st meeting.

Following the open house period, Metro gave a presentation regarding the purpose of the scoping meeting and the proposed project. Metro placed emphasis on the importance of community participation and noted comments could be made in person at the scoping meetings or by telephone, fax, postal mail, or e-mail. Following the presentation, the public had the opportunity to make verbal comments. A court reporter transcribed the public's comments.

Metro moderated public comments, providing two minutes for speakers who had submitted speaker cards and four minutes for speakers that required translation services. After the comment portion, staff remained to field additional questions or comments. Approximately 175 persons attended the four scoping meetings. Metro conducted a 49-day scoping period for receiving public comments, which was longer than the required 45-day period. Metro received a total of 127 comments from the public as letters, e-mails, comment cards, or oral testimony.

Metro held additional community update meetings during November 2009. Like the public scoping meetings, Metro gave notice of community update meetings through a variety of media and in multiple languages. Meetings involved an open house period, a presentation, and an opportunity for attendees to comment orally or in writing. These meetings were held as follows:

- November 5, 2009 – Lake Avenue Church, City of Pasadena
- November 7, 2009 – Wurlitzer Building, Historic Core, Los Angeles
- November 10, 2009 – Los Angeles Central Library, Bunker Hill, Los Angeles
- November 12, 2009 – Japanese American National Museum, Little Tokyo, Los Angeles

Metro also held additional meetings with stakeholders. The stakeholders included the LTCC, LTSC, and BIDs, among other groups.

4.6.3 Public Outreach in Little Tokyo

Little Tokyo is important because it is the only identified minority portion of the project area. The area has historic character and symbolic importance to Japanese-Americans. In the PPP, Metro set up a task force responsible for outreach to Little Tokyo. As a result, Metro held several meetings in Little Tokyo. Table 4-8 shows the schedule of meetings.

During alternatives analysis of the proposed project, Metro held a scoping meeting at the Japanese American National Museum (November 7, 2007) and two community update meetings (February 26 and October 21, 2008). During the draft EIS/EIR phase, Metro held a scoping meeting (April 1, 2009)

and three update community meetings (one on August 5, 2009 and two on November 12, 2009) in Little Tokyo. Metro has held meetings with Little Tokyo stakeholders including the LTCC, LTSC, the Japanese American National Museum (JANM), and the Japanese Chamber of Commerce of Southern California.

Metro established the Little Tokyo Working Group (LTWG), which is comprised of stakeholders in Little Tokyo and the Arts District. The LTWG is a regularly-scheduled forum that allows closer examination of community concerns related to the Regional Connector project. The group typically meets bi-weekly or as needed. Metro attends the meetings along with members of the environmental consultant team. The LTWG will function through the final EIS/EIR process. Although the LTWG gathers several stakeholders in one place, it is not intended to take the place of meetings with individual stakeholders. Appendix A is a letter from the Little Tokyo Community Council thanking Metro for their outreach to and work with the community and for developing the Fully Underground LRT Alternative – Little Tokyo Variation 1 in response to community concerns.

Metro sought to ensure participation by LEP populations near Little Tokyo. Accordingly, it published notices of meetings in the *Rafu Shimpo*, a local Japanese-language newspaper, and the *Los Angeles Garment and Citizen*, and English/Spanish-language newspaper. During the community meetings in Little Tokyo, Metro provided presentation materials in English, Spanish, and Japanese and provided translation services in Spanish and Japanese. Metro employed street canvassing to distribute information about meetings to pedestrians and businesses in Little Tokyo.

Appendix B shows a matrix of stakeholder meetings and presentation materials.

4.6.4 Comments Regarding Environmental Justice

Of 127 comments received during the scoping process, 20 directly related to environmental justice issues. Most comments focused on potential impacts to Little Tokyo. Issues of concern included the following:

- Impacts to local businesses during construction
- Access to local businesses and to Little Tokyo in general during construction
- Loss of parking during construction and operations
- Safety at the 1st Street/Alameda Street intersection
- Displacement of more businesses in Little Tokyo/Loss of space
- Community cohesion

Project impacts related to these concerns are discussed in the following section.

Table 4-8. Public Outreach in Little Tokyo

Meeting	Date	Location
General Community Meetings		
Early Scoping Meeting (AA Phase)	11/07/2007	JANM
Community Update Meeting #1 (AA Phase)	02/26/2008	JANM
Community Update Meeting #2 (AA Phase)	10/21/2008	JANM
Scoping Meeting (Draft EIS/EIR)	04/01/2009	JANM
Community Update Meeting #1(Draft EIS/EIR)	08/05/2009	JANM
Community Update Meeting #2 (Draft EIS/EIR) (two meetings the same day)	11/12/2009 2:00PM and 6:30PM	JANM
Stakeholder Meetings

Source: Metro, Final Alternatives Analysis Report, December 2008; The Roberts Group, 2010

5.0 IMPACTS

5.1 No Build Alternative

Under the No Build Alternative, transit infrastructure investment would be limited to improvements planned in the 2009 Metro LRTP. By 2035, several new Metro rail lines will exist and bus services will have been reorganized and expanded to connect with these rail lines. The transit network within the project area will otherwise be largely the same as it is now.

5.1.1 Transit Service Equity

Transit lines from several service providers currently serve the project area. Providers of transit include Metro, the City of Los Angeles Department of Transportation (LADOT), Foothill Transit, the Orange County Transit Authority (OCTA), and Montebello Bus Lines. The project area is served by the Metro Blue Line to Long Beach, the Metro Red Line to North Hollywood, the Metro Purple Line to Wilshire/Western, and the Metro Gold Lines to Pasadena and East Los Angeles. The Metro Gold Lines stop in Little Tokyo. The No Build Alternative would maintain the current level of bus and rail transit access in the project area.

The No Build alternative would not increase connectivity to regional public transit; therefore, low-income and minority populations in the project area may not have equitable access to jobs and services. This is particularly true of populations in Little Tokyo. Traffic congestion throughout the region is anticipated to increase. Like automobile traffic, current transit services would be impacted by this congestion. This effect would occur throughout the project area and the Los Angeles region, and would not occur disproportionately in Little Tokyo. Therefore, the No Build Alternative would not result in direct, indirect, or cumulative disproportionate adverse impacts with respect to transit service equity.

5.1.2 Traffic Congestion

Traffic congestion is expected to increase in the project area region. All communities, regardless of socioeconomic or minority status, would be affected. Downtown Los Angeles and Little Tokyo would remain common destinations for commuters in vehicles. Some congestion relief would occur under the No Build Alternative with transit improvements planned in the Metro 2009 LRTP. The No Build Alternative would not divert a disproportionate concentration of congestion to the Little Tokyo area. The No Build Alternative would not have direct, indirect, or cumulative disproportionate adverse impacts to traffic congestion.

5.1.3 Parking

On-street parking conditions are not anticipated to substantially change under the No Build Alternative. Therefore, no direct, indirect, or cumulative disproportionate adverse impacts related to parking are anticipated.

5.1.4 Displacement and Relocation

The No Build Alternative would not displace businesses or populations in the project area. No direct, indirect, or cumulative disproportionate adverse impacts associated with displacements are anticipated.

5.1.5 Community and Neighborhoods

The No Build Alternative would not involve street closures or result in disproportionate adverse impacts to community cohesion, access, or exclusion. Therefore, no direct, indirect, or cumulative disproportionate adverse impacts associated with communities are anticipated.

5.1.6 Visual Resources and Aesthetics

The No Build Alternative would not change visual elements that currently exist in the project area. Therefore, no direct, indirect, or cumulative disproportionate adverse impacts to visual resources and aesthetics are anticipated.

5.1.7 Air Quality

The No Build Alternative includes transit projects that would reduce regional criteria pollutant emissions. However, increased congestion would increase emissions. As a result, minority and low-income populations in the project area would be adversely impacted. Adverse air quality impacts associated with increased congestion would be spread over the entire region. All communities, regardless of minority status or income, would be affected. Therefore, no direct, indirect, or cumulative disproportionate impacts to air quality are anticipated.

5.1.8 Noise and Vibration

Transit projects would not be constructed in the project area under the No Build Alternative. Therefore, no direct, indirect, or cumulative disproportionate impacts associated with noise and vibration are anticipated.

5.1.9 Geotechnical/Subsurface/Seismic/Hazardous Materials

Transit project would not be constructed in the project area under the No Build Alternative. Therefore, no direct, indirect, or cumulative disproportionate impacts associated with geotechnical/subsurface/seismic/hazardous materials are anticipated.

5.1.10 Water Quality

The project area is heavily urbanized and covered largely by impervious surfaces. The No Build Alternative would not result in additional water runoff that could impact water quality in the project area. No direct, indirect, or cumulative disproportionate adverse impacts to water quality are anticipated.

5.1.11 Energy

Under the No Build Alternative, increased Vehicle Miles Traveled (VMT) would result in increased automobile fuel consumption throughout the project area and region. The region would be adversely impacted, but the impact would not fall disproportionately on the project area. No direct, indirect, or cumulative disproportionate adverse impacts related to energy are anticipated.

5.1.12 Climate Change

There would be emissions associated with construction and operation of transit projects under the No Build Alternative, but the effects would be regional, not localized. Transit projects would not be

constructed in the project area. No direct, indirect, or cumulative disproportionate adverse impacts associated with climate change are anticipated.

5.1.13 Historic, Archaeological, and Paleontological Resources

Construction of transit projects in the project area would not occur under the No Build Alternative. Thus, this alternative would not disturb archaeological or paleontological resources or alter historic or architectural resources. No direct, indirect, or cumulative disproportionate adverse impacts to historic, archaeological, or paleontological resources are anticipated.

5.1.14 Parklands and Other Community Facilities

Parklands and community facilities would not be acquired under the No Build Alternative. Therefore, no direct, indirect, or cumulative disproportionate adverse impacts to parklands or other community facilities are anticipated.

5.1.15 Economic Vitality and Employment Opportunities

Transit projects would not be constructed in the project area under the No Build Alternative. Economic vitality could change in Little Tokyo due to trends unrelated to this project alternative. No direct, indirect, or cumulative disproportionate adverse impacts to economic vitality and employment opportunities are anticipated.

5.1.16 Safety and Security

Transit projects would not be constructed in the project area. No direct, indirect, or cumulative disproportionate adverse impacts to safety and security are anticipated.

5.1.17 Construction Impacts

Transit projects would not be constructed in the project area. No direct, indirect, or cumulative disproportionate adverse impacts from construction are anticipated.

5.2 Transportation Systems Management (TSM) Alternative

The TSM Alternative would link the 7th Street/Metro Center Station and Union Station with two new express shuttle bus lines. These buses would run frequently, especially during peak hours. The buses may also have traffic signal priority like the Metro Rapid system. Signal priority is a traffic signal control system that grants longer green lights to oncoming transit vehicles. Bus stops would be located every two to three blocks to maximize transit access to the surrounding area. New bus stops and signage would be added. Additionally, like under the No Build Alternative, other, unrelated transit projects would be constructed in the region.

5.2.1 Transit Service Equity

Transit lines from several service providers currently serve the project area. Providers of transit include Metro, the City of Los Angeles Department of Transportation (LADOT), Foothill Transit, the Orange County Transit Authority (OCTA), and Montebello Bus Lines. The TSM Alternative would maintain local bus and rail transit in the project area and add new shuttle bus lines that would serve Little Tokyo and low-income communities in the project area.

The TSM Alternative would not increase connectivity to regional mass transit as much as the build alternatives, including the Locally Preferred Alternative; therefore, low-income and minority populations in the project area may not have improved access to jobs and services. Traffic congestion throughout the region is anticipated to increase. Like automobile traffic, current transit services would be impacted by this congestion. This effect would occur throughout the project area and the Los Angeles region, and would not occur disproportionately in Little Tokyo. Therefore, the TSM Alternative would not result in direct, indirect, or cumulative disproportionate adverse impacts with respect to transit service equity.

5.2.2 Traffic Congestion

The TSM Alternative would enhance the link between Union Station and the 7th Street/Metro Center Station. To a limited extent, the enhanced connection would increase transit ridership on connecting rail lines and reduce vehicle trips into the downtown area. A modest, beneficial impact to traffic congestion is anticipated.

There may be increased delays for vehicular traffic if new buses are given signal priority. The downtown area is characterized by short block segments and interaction between intersections. Thus, the Little Tokyo community would not be disproportionately impacted by the TSM Alternative. No direct, indirect, or cumulative disproportionate adverse impacts to traffic congestion are anticipated.

5.2.3 Parking

5.2.3.1 Direct Impacts

The TSM Alternative would result in the permanent loss of up to 24 on-street parking spaces. Parking spaces would be lost from installation of new bus stops on 2nd Street between Hill Street and Central Avenue. Up to twelve of the lost spaces would be found in Little Tokyo where the community has expressed concern over parking loss. Disproportionate adverse impacts related to parking in Little Tokyo are anticipated.

5.2.3.2 Indirect Impacts

There would be no indirect disproportionate adverse impacts to parking under the TSM Alternative.

5.2.3.3 Cumulative Impacts

There would be no cumulative disproportionate adverse impacts to parking under the TSM Alternative.

5.2.4 Displacement and Relocation

The TSM Alternative would not displace businesses or populations in the project area. No direct, indirect, or cumulative disproportionate adverse impacts associated with displacements are anticipated.

5.2.5 Community and Neighborhoods

The TSM Alternative would not involve changes, such as street closures, resulting in disproportionate effects to community cohesion, access, and exclusion. Construction of new bus stops and signage would not impact the viability of neighborhoods. Up to 24 parking spaces would be displaced on 2nd Street, and this may introduce the perception of a negative effect on nearby businesses. However, this

would be an insignificant amount of parking loss, compared to the amount of readily available off-street parking and other curb parking in the area. Therefore, no direct, indirect, or cumulative disproportionate adverse impacts to community cohesion or access are anticipated.

5.2.6 Visual Resources and Aesthetics

The TSM Alternative would not introduce visual elements inconsistent with the current aesthetic of Little Tokyo or the project area. New bus stop shelters and signage would be similar to existing ones and would not block building frontages. Therefore, no direct, indirect, or cumulative disproportionate adverse impacts to visual resources and aesthetics are anticipated.

5.2.7 Air Quality

The TSM Alternative would enhance the link between Union Station and the 7th Street/Metro Center Station. To a limited extent, the enhanced connection would increase transit ridership on connecting rail lines and reduce vehicle trips into the downtown area. A modest beneficial impact to regional criteria pollutant emissions is anticipated. Increased transit traffic could lead to increased travel times for vehicle traffic. Adverse air quality impacts associated with increased congestion would be spread over the entire region. All communities, regardless of minority status or income, would be affected. Therefore, no direct, indirect, or cumulative disproportionate impacts to air quality are anticipated.

5.2.8 Noise and Vibration

The TSM Alternative would introduce new bus service in the project area. Bus activity would have to more than double to noticeably increase bus-related noise. Noise and vibration from increased bus activity in the project area would be similar to existing levels. Therefore, no direct, indirect, or cumulative disproportionate impacts from noise and vibration are anticipated.

5.2.9 Geotechnical/Subsurface/Seismic/Hazardous Materials

Construction of bus shelters under this alternative would result in minimal excavation of soil. Therefore, no direct, indirect, or cumulative disproportionate impacts associated with geotechnical/subsurface/seismic/hazardous materials are anticipated.

5.2.10 Water Quality

The project area is heavily urbanized and covered largely by impervious surfaces. The TSM Alternative would not result in additional water runoff that could impact water quality in the project area. No direct, indirect, or cumulative disproportionate adverse impacts to water quality are anticipated.

5.2.11 Energy

Construction under the TSM Alternative would use minimal amounts of energy. New buses would run on Compressed Natural Gas (CNG), which would result in a one percent increase in energy consumption. This alternative would reduce regional VMT. Beneficial impacts to energy consumption from reduced VMT are anticipated in the project area.

5.2.12 Climate Change

The TSM Alternative would add two new bus lines to the project area. Effects from emissions of new buses would result regionally, not locally. The TSM Alternative would be consistent with State Bill (SB)

375 because it increases regional transportation capacity and decreases emissions from passenger vehicles. No direct, indirect, or cumulative disproportionate adverse impacts associated with climate change are anticipated.

5.2.13 Historic, Archaeological, and Paleontological Resources

The TSM Alternative would introduce new bus service in the project area. Buses would not differ from existing area transit. No direct, indirect, or cumulative disproportionate adverse impacts to historic, archaeological, or paleontological resources are anticipated.

5.2.14 Parklands or Other Community Facilities

The TSM Alternative would not have adverse impacts on parklands and community facilities. New buses would operate on existing right-of-ways and involve minimal infrastructure construction. Therefore, no direct, indirect, or cumulative disproportionate adverse impacts to parklands or other community facilities are anticipated.

5.2.15 Economic Vitality and Employment Opportunities

The TSM Alternative would introduce new shuttle service in the project area. New shuttle service would increase transportation access to Little Tokyo. As such, beneficial impacts to economic vitality and employment opportunities are predicted.

5.2.16 Safety and Security

5.2.16.1 Direct Impacts

The TSM Alternative would add two bus lines to the project area. The TSM Alternative could potentially change street crossing times in Little Tokyo and impact safety for elderly pedestrians. However, these effects would be spread throughout the entire project area. In addition, Metro would coordinate with LADOT regarding the signalization of shuttle service in Little Tokyo. Metro would conduct a pedestrian education program in Little Tokyo focusing on transit safety for the new shuttles. Disproportionate adverse impacts to safety and security are not anticipated.

5.2.16.2 Indirect Impacts

This alternative would not result in disproportionate adverse impacts to safety or security.

5.2.16.3 Cumulative Impacts

This alternative would not result in cumulative disproportionate adverse impacts to safety or security.

5.2.17 Construction Impacts

Construction under the TSM Alternative would be minimal (stops and signage). Construction methods would not be unique. Bus stops would use the existing right-of-way. Street closures would be unnecessary, so mobility would not be limited. Table 5-1 shows potential disproportionate construction-related impacts for the proposed TSM Alternative. Disproportionate impacts associated with parking during construction are not anticipated. No other direct, indirect, or cumulative disproportionate adverse construction-related impacts are anticipated.

Table 5-1. Summary of Construction Impacts for the TSM Alternative

Topic	Impact Determination	Disproportionate Impact	EJ Mitigation	EJ Impact After Mitigation
Traffic, Circulation, and Parking	Not Adverse	Not Adverse	None	Not Adverse
Land Use and Development	Not Adverse	Not Adverse	None	Not Adverse
Displacement and Relocation	Not Adverse	Not Adverse	None	Not Adverse

Source: TAHA, 2010

5.3 At-Grade Emphasis LRT Alternative

The At-Grade Emphasis LRT Alternative would start tracks at the 7th Street/Metro Center Station, head north under Flower Street, resurface north of 4th Street, cross 3rd Street, enter Bunker Hill, and turn northeast through a new entrance to the existing 2nd Street tunnel. The alignment would continue along 2nd Street and split into an at-grade couplet configuration traveling north on Main and Los Angeles Streets (one track on each roadway).

The alignment would then head east on Temple Street, realign into a dual track configuration just east of Los Angeles Street, and connect to Metro Gold Line tracks in a 3-way junction north of the Little Tokyo/Arts District Station on Alameda Street. An automobile underpass and pedestrian overpass will be constructed at the intersection of Temple and Alameda Streets to eliminate pedestrian-train and automobile-train conflicts. Traffic lanes and parking on 2nd Street would be reduced.

5.3.1 Transit Service Equity

Transit lines from several service providers currently serve the project area. Providers of transit include Metro, the LADOT, Foothill Transit, the OCTA, and Montebello Bus Lines. The At-Grade Emphasis LRT Alternative would create new transit stations in the project area, increasing access to the project area. This alternative would increase regional mobility for minority and low-income communities. Increased regional connectivity would reduce transit transfers. This would have a beneficial economic impact to elderly and low-income communities.

Increased regional connectivity would enhance access to major employment centers, including to civic employers in downtown. This alternative would not create a new station in Little Tokyo, but would connect to the Metro Gold Line, which currently serves Little Tokyo. This alternative would have direct, beneficial impacts to transit equity.

5.3.2 Traffic Congestion

The At-Grade Emphasis LRT Alternative would significantly impact traffic at several intersections. During AM peak hours, 17 intersections would experience significant congestion compared to the No Build Alternative. Of these 17 intersections, four are in Little Tokyo. During PM peak hours, 26 intersections would experience significant congestion compared to the No Build Alternative. Four of these 26 intersections are in Little Tokyo. Despite a potentially significant increase in traffic congestion in the project area, the congestion would not be concentrated in Little Tokyo. Therefore, no disproportionate impacts to traffic congestion are anticipated.

5.3.3 Parking

5.3.3.1 Direct Impacts

The At-Grade Emphasis LRT Alternative would result in the permanent loss of up to 51 on-street parking spaces, 29 on-street loading spaces and 77 pay-to-park spaces. Of these, 33 pay to-park spaces, 23 on-street parking spaces, and five on-street loading spaces are in Little Tokyo. Both on- and off-street parking is limited in Little Tokyo. The Little Tokyo community has expressed concern over potential loss of parking. Disproportionate adverse impacts to parking availability for Little Tokyo are anticipated.

5.3.3.2 Indirect Impacts

The removal of parking spaces under the At-Grade Emphasis LRT Alternative could adversely impact businesses in the project area. Business revenue could drop if vehicular access to businesses is reduced. New transit would provide increased pedestrian access to businesses, which may offset some adverse impact. However, disproportionate impacts are anticipated within the Little Tokyo community area.

5.3.3.3 Cumulative Impacts

The At-Grade Emphasis LRT Alternative would result in the permanent displacement of 128 parking spaces (including 51 on-street parking spaces), 56 of them in Little Tokyo. The community has expressed concern over potential loss of parking. Many older businesses in the project area do not provide as many parking spaces as code requires. Thus, surface lots are an important community resource in the project area.

Transit projects compensate for loss of parking because they reduce vehicle traffic and the demand for parking. This alternative would increase non-automobile, transit access to the project area. Therefore, the proposed At-Grade Emphasis LRT Alternative would partially offset potential adverse impacts to parking. Still, disproportionate cumulative impacts to parking are expected within the Little Tokyo community.

5.3.4 Displacement and Relocation

The At-Grade Emphasis LRT Alternative would not displace businesses or result in the loss of jobs in Little Tokyo. No direct, indirect, or cumulative disproportionate adverse impacts associated with displacements are anticipated.

5.3.5 Community and Neighborhoods

5.3.5.1 Direct Impacts

The At-Grade Emphasis LRT Alternative would not result in street closures. The parcels or portions of parcels that would be permanently displaced are currently vacant or occupied by civic uses or paid parking lots. Partial takes of civic parcels would displace primarily ornamental landscape elements. Therefore, takes would not reduce the amount of public services, open space, or building space that is available to the community.

This alternative would not adversely impact the cohesion or identity of Little Tokyo. However, this alternative would displace several on-street parking spaces in Little Tokyo. Increased access to and mobility within the project area would be a beneficial impact to the project area. This increased access through transit would offset some loss of parking. However, disproportionate impacts to community and neighborhood cohesion are expected.

The Alameda Street underpass at Temple Street would provide enough frontage road to continue to permit deliveries to the Japanese American National Museum (JANM) along Alameda Street. Bus loading areas on Alameda Street in front of the museum would be removed. Other bus loading spaces would be available adjacent to the museum on 1st Street. Other bus loading spaces could be created.

The Go For Broke Monument is located south of the proposed alignment along Temple Street. While the At-Grade Emphasis LRT Alternative would remove parking spaces in the parking lot adjacent to the Monument, the Monument would not be displaced. After mitigation measures are employed, no direct adverse impacts to culturally-significant community and neighborhood facilities are anticipated.

5.3.5.2 Indirect Impacts

A loss of parking under the At-Grade Emphasis LRT Alternative could result in indirect disproportionate impacts because the majority of displaced parking would be in Little Tokyo. Increased transit access in the project area may partially offset the loss of parking, but Little Tokyo would be adversely impacted. Local businesses that rely on paid parking lots and on-street parking could be adversely impacted. The community of Little Tokyo has expressed concern over parking loss and the corresponding effect on businesses. Indirect disproportionate adverse impacts to this minority community are anticipated.

5.3.5.3 Cumulative Impacts

Approximately 12 new land development construction projects are anticipated in the project area between now and 2014. An additional 54 new land development construction projects are anticipated between 2014 and 2018. Twelve major renovation projects are anticipated between now and 2014, and eight are expected between 2014 and 2018. Several projects would occur in Little Tokyo or the close vicinity and would involve the removal of public paid-parking lots. Thus, parking loss under the At-Grade Emphasis LRT Alternative would contribute cumulatively to parking loss in Little Tokyo. Loss of parking would result in cumulative disproportionate adverse impacts.

5.3.6 Visual Resources and Aesthetics

The At-Grade Emphasis LRT Alternative would run underground through the Financial District and at-grade in Bunker Hill, Civic Center, and on the periphery of Little Tokyo. New visual elements like pedestrian bridges, catenary poles and overhead wires and stations would be created in the project area. Two major visual elements of the At-Grade Emphasis LRT Alternative, the Alameda Street underpass at Temple Street and the potential pedestrian bridge at Temple Street and Alameda Street, would be located adjacent to Little Tokyo. This would result in a disproportionate visual impact.

5.3.7 Air Quality

Under the At-Grade Emphasis LRT Alternative, VMT would decrease by approximately 673,000 miles. A beneficial impact to criteria pollutant emissions is anticipated.

5.3.8 Noise and Vibration

The operation of the At-Grade Emphasis LRT Alternative would have moderate noise impacts on two sensitive receptors. These receptors are not located in Little Tokyo, so no disproportionate adverse impact from noise is expected. No direct, indirect, or cumulative disproportionate adverse impacts from vibration are anticipated.

5.3.9 Geotechnical/Subsurface/Seismic/Hazardous Materials

Under the At-Grade Emphasis LRT Alternative, there is the potential for intrusion of subsurface gases in the underground portion of the alignment. Mitigation measures would address these impacts. The At-Grade Emphasis LRT Alternative is located underground beneath the Financial District and Bunker

Hill, and is not located underground in Little Tokyo. Therefore, no direct, indirect, or cumulative disproportionate adverse impacts associated with geotechnical/subsurface/ seismic/hazardous materials are anticipated.

5.3.10 Water Quality

The project area is heavily urbanized and covered largely by impervious surfaces. The At-Grade LRT Alternative would not result in additional water runoff that could impact water quality in the project area. No direct, indirect, or cumulative disproportionate adverse impacts to water quality are anticipated.

5.3.11 Energy

This alternative would reduce VMT in the project area by approximately 673,000 miles, which would be a beneficial impact in the project area. Energy usage for new rail lines and stations would result in a less than one percent increase in consumption in the Los Angele Department of Water and Power (LADWP) service area. Therefore, no direct, indirect, or cumulative disproportionate adverse impacts to energy consumption are anticipated. In fact, a beneficial impact to energy consumption from reduced VMT is anticipated in the project area.

5.3.12 Climate Change

Under the At-Grade Emphasis LRT Alternative, Greenhouse Gas (GHG) emissions in 2035 would decrease compared to the No Build Alternative and increase compared to existing 2009 emissions due to regional growth between 2009 and 2035 unrelated to the project. These effects would be regional and not localized. The At-Grade Emphasis LRT Alternative would be consistent with SB 375 in increasing regional transportation capacity and decreasing emissions from passenger vehicles. No direct, indirect, or cumulative disproportionate adverse impacts associated with climate change are anticipated.

5.3.13 Historic, Archaeological, and Paleontological Resources

The At-Grade Emphasis LRT Alternative would not have direct, indirect, or cumulative disproportionate adverse impacts to historic, archaeological, or paleontological resources.

5.3.14 Parklands or Other Community Facilities

5.3.14.1 Direct Impacts

The At-Grade Emphasis LRT Alternative alignment would run adjacent to a park in the project area (City Hall) but would not impede access to it. The At-Grade Emphasis LRT Alternative would eliminate uncontrolled, mid-block left turns. This could impede access to community facilities on 2nd Street, Los Angeles Street, and Main Street. Disproportionate adverse impacts to community facilities could occur but would be partially offset by the increased access provided by the LRT and thus would be less than significant.

5.3.14.2 Indirect Impacts

There would be no indirect disproportionate adverse impacts to parklands or other community facilities.

5.3.14.3 Cumulative Impacts

There would be no cumulative disproportionate adverse impacts to parklands or other community facilities.

5.3.15 Economic Vitality and Employment Opportunities

The At-Grade Emphasis LRT Alternative would enhance transportation access to Little Tokyo. Thus, beneficial impacts to economic vitality are anticipated.

5.3.16 Safety and Security

5.3.16.1 Direct Impacts

This alternative could increase potential conflicts between pedestrians or vehicles and trains. New underground stations could raise security concerns, particularly at night. These safety and security issues are applicable to light rail regardless of the socioeconomic or ethnic status of the surrounding community.

In the Little Tokyo area, Metro would offer to build a pedestrian bridge, across Alameda Street, just north of the Little Tokyo/Arts District Station. This bridge would separate pedestrian movements from LRT and motorized vehicle movements. If the community opts against construction of the pedestrian bridge, Metro would use design to enhance pedestrian safety.

Metro would create pedestrian queuing and refuge areas around proposed stations. Adding wide crosswalks would also facilitate pedestrian mobility. No disproportionate impacts to safety or security are anticipated.

5.3.16.2 Indirect Impacts

There would be no indirect disproportionate adverse impacts to safety and security under the At-Grade Emphasis LRT Alternative.

5.3.16.3 Cumulative Impacts

There would be no cumulative disproportionate adverse impacts to safety and security under the At-Grade Emphasis LRT Alternative.

5.3.17 Construction Impacts

Table 5-2 shows potential construction impacts under this alternative. Table 5-2 shows whether such impacts would be disproportionately adverse.

Construction of the At-Grade Emphasis LRT Alternative would potentially have adverse impacts associated with the following environmental topics:

- Parking and Circulation
- Visual Resources
- Community and Neighborhood Impacts

- Noise and Vibration
- Community Facilities
- Economic and Fiscal

Table 5-2. Summary of Construction Impacts for the At-Grade Emphasis LRT Alternative

Topic	Impact Determination	Disproportionate Impact	EJ Mitigation	Impact After EJ Mitigation
Traffic, Circulation, & Parking	Potentially Adverse	Potentially Adverse for Parking and Circulation	Yes	Not Adverse
Land Use & Development	Not Adverse	Not Adverse	None	Not Adverse
Displacement & Relocation	Potentially Adverse, 2 temporary construction easements	Not Adverse	None	Not Adverse
Community & Neighborhood Impacts	Potentially Adverse, mobility and access reduced	Indirectly Potentially Adverse	Yes	Not Adverse

Source: TAHA, 2010

5.3.17.1 Direct Impacts

Traffic Circulation

Construction of the At-Grade Emphasis LRT Alternative would result in temporary closure of several streets in the project area. In particular, construction of the Alameda Street underpass at Temple Street could result in disproportionate adverse impacts to Little Tokyo and the Japanese American National Museum. Unlike other street closures, closure of Alameda Street could be long term, unless the cut-and-cover method is used to construct the underpass. Alameda Streets is a major arterial providing access to Little Tokyo.

In addition, 2nd Street would be temporarily closed from Bunker Hill to the western border of Little Tokyo. Traffic would divert to 1st Street, which is already congest in Little Tokyo. Although construction impacts are short-term and intermittent, they would result in disproportionate adverse impacts.

Parking

Construction of the At-Grade Emphasis LRT Alternative would result in temporary displacement of on-street parking. Construction could restrict access to parking lots like the parking lot at the southwest corner of the intersection of Alameda and Temple Streets. This parking lot would be further restricted once Alameda Street is closed for underpass construction. Restricting access to the parking lot and curb parking would have disproportionate adverse impacts to Little Tokyo and the Japanese American National Museum. Construction impacts are short-term and intermittent, but they would result in disproportionate adverse impacts.

Community Facilities

Construction of the At-Grade Emphasis LRT Alternative would temporarily restrict access to the Japanese American National Museum. Access to the museum would be decreased during construction of the Alameda Street underpass and pedestrian bridge. Loading spaces along Alameda Street would be temporarily displaced, and congestion would increase on 1st Street when 2nd Street is

closed. Overall, access to the building would be maintained. Construction impacts are short-term and intermittent, but they would result in disproportionate adverse impacts.

Visual Resources

Most construction of this alternative would occur outside Little Tokyo. However, several large components of construction would occur near Little Tokyo including the Alameda Street underpass and pedestrian bridge. This construction could result in disproportionate adverse impacts to Little Tokyo and the Japanese American National Museum. Construction equipment and work areas in this area would be larger than most laydown areas in the alignment. Construction impacts are short-term and intermittent, but they would result in disproportionate adverse impacts.

Parklands and Other Community Facilities

During construction of the At-Grade Emphasis LRT Alternative, street closures could restrict access to facilities adjacent to construction sites, such as the Little Tokyo Branch Public Library, MOCA, JANM, and the Go for Broke Monument, in addition to other facilities throughout the project area. Automobile and pedestrian detours would be needed. Annual festivals in the downtown area could also be temporarily affected. Emergency service response times could also be affected by the temporary street closures and detours. Construction impacts would be temporary and short-term, but they would be disproportionate.

5.3.17.2 Indirect Impacts

Community and Neighborhood Impacts

Construction of the At-Grade Emphasis LRT Alternative would result in temporary closure of several streets near Little Tokyo. Though temporary, these closures could restrict access to businesses in Little Tokyo. Impacts to businesses would affect the entire community.

In particular, construction of the Alameda Street underpass and potential pedestrian bridge could result in disproportionate adverse impacts to Little Tokyo and the Japanese American National Museum. A closure of Alameda Street here could be particularly long. Alameda Street is one of the main arterials providing access to Little Tokyo. Construction impacts are short-term and intermittent, but they would result in disproportionate adverse impacts.

Economic and Fiscal

Construction of the At-Grade Emphasis LRT Alternative would result in temporary closure of several streets in the project area. Construction of the Alameda Street underpass could result in disproportionate adverse impacts to Little Tokyo and the Japanese American National Museum. A closure of Alameda Street here could be particularly long. Alameda Street is one of the main arterials providing access to Little Tokyo.

2nd Street would be closed for construction from Bunker Hill to the western border of Little Tokyo. Traffic would divert to 1st Street, which is already heavily congested in Little Tokyo. Construction impacts could adversely affect the economic viability of some businesses in Little Tokyo. Construction impacts are short-term and intermittent, but they would result in disproportionate adverse impacts.

5.3.17.3 Cumulative Impacts

One major development is anticipated in Little Tokyo, the Nikkei Center. However, this alternative would not contribute cumulatively to disproportionate adverse impacts.

5.4 Underground Emphasis LRT Alternative

The Underground Emphasis LRT Alternative would extend from the 7th Street/Metro Center Station north along Flower Street. A new station would be constructed north of 5th Street. At 2nd Street, an underground tunnel would extend east. A new underground station would be constructed near 2nd and Hope Streets, providing access to Bunker Hill. Another new underground station would be located either between Broadway and Spring Street or between Main and Los Angeles Streets.

A tunnel would emerge to the surface just southwest of the intersection of 1st and Alameda Streets. At 1st and Alameda Streets, a vehicle underpass and pedestrian overpass would be constructed. This would reduce pedestrian and vehicle conflicts with trains. This alternative would have a single, at-grade crossing at the intersection of 1st and Alameda Streets.

5.4.1 Transit Service Equity

5.4.1.1 Direct Impacts

Several transit lines serve the project area. Transit providers include Metro, the LADOT, Foothill Transit, the OCTA, and Montebello Bus Lines. The Underground Emphasis LRT Alternative would create new transit stations, increasing access to the project area. Additionally, the Underground Emphasis LRT Alternative would increase regional mobility for minority and low-income communities.

Increased mobility includes a reduced number of transit transfers. Having fewer transfers would have a beneficial economic impact to elderly and low-income communities. Increased connectivity would add access to major employment centers, like all civic employers in downtown. The Underground Emphasis LRT Alternative would create a new transit station in Little Tokyo and increase this area's connectivity to the region. Beneficial impacts to transit equity are anticipated.

5.4.1.2 Indirect Impacts

There would be no indirect disproportionate adverse impacts to transit service equity under the Underground Emphasis LRT Alternative.

5.4.1.3 Cumulative Impacts

There would be no cumulative disproportionate adverse impacts to transit service equity under the Underground Emphasis LRT Alternative.

5.4.2 Traffic Congestion

Traffic at few intersections would be significantly impacted by operations of the Underground Emphasis LRT Alternative. In the AM peak hours, three intersections would experience new, significant traffic delays. Of these three intersections, two are located in the vicinity of Little Tokyo.

In the PM peak hours, seven intersections would experience new, significant traffic delays. Of these seven intersections, four would be located in and around Little Tokyo. Significant traffic impacts are

anticipated throughout the project area, but the majority would affect the Little Tokyo area. Therefore, disproportionate adverse impacts to traffic congestion are anticipated.

5.4.3 Parking

5.4.3.1 Direct Impacts

The Underground Emphasis LRT Alternative would permanently remove 148 to 281 pay-to-park parking spaces, 17 on-street parking spaces, and three on-street loading spaces. Of these spaces, 139 (49 to 94 percent of the total parking loss) pay-to-park spaces, ten on-street parking spaces, and the three on-street loading spaces are located in Little Tokyo. Parking opportunities in Little Tokyo are already limited.

The Little Tokyo community has expressed the importance of parking to their community. This alternative would partially offset the loss of parking due to increased transit use. However, disproportionate adverse impacts to parking availability in Little Tokyo are expected.

5.4.3.2 Indirect Impacts

Removal of off-street parking spaces would indirectly impact businesses in Little Tokyo. Business revenue could decrease if vehicular access to businesses is reduced. New transit would provide increased pedestrian access to businesses and may offset some adverse impacts from decreased vehicular access. However, disproportionate impacts associated with loss of parking are expected.

5.4.3.3 Cumulative Impacts

The Underground Emphasis LRT Alternative would result in permanent displacement of 149 parking spaces in Little Tokyo. The Little Tokyo community has expressed concerns regarding loss of parking space. Many older businesses in the project area do not provide as many parking spaces as code requires. Thus, surface lots are an important community resource in the project area.

Transit projects compensate for loss of parking because they reduce vehicle traffic and the demand for parking. This alternative would increase non-automobile, transit access to the project area. Therefore, this alternative would partially offset potential adverse impacts to parking. Still, disproportionate cumulative impacts to parking in the Little Tokyo community are expected.

5.4.4 Displacement and Relocation

5.4.4.1 Direct Impacts

The Underground Emphasis LRT Alternative would require seven partial takes, 12 full takes, 13 temporary construction easements, and 11 permanent underground easements. This alternative would require these properties for Traction Power Substation (TPSS) site locations, construction staging, right-of-way, below grade tunneling, and stations. In Little Tokyo, seven full takes would be required. Takes of these properties would displace three businesses and approximately 90 jobs. This is a more significant impact than displacement in the rest of the project area. Thus, there would be a disproportionate adverse impact associated with displacement.

5.4.4.2 Indirect Impacts

There would be no indirect disproportionate adverse impacts associated with displacement under the Underground Emphasis LRT Alternative.

5.4.4.3 Cumulative Impacts

There would be no cumulative disproportionate adverse impacts associated with displacement under the Underground Emphasis LRT Alternative.

5.4.5 Community and Neighborhoods

5.4.5.1 Direct Impacts

Construction of the Underground Emphasis LRT Alternative would displace approximately 13 businesses. Approximately 130 jobs would be displaced. Approximately 70 percent of these jobs would be lost in Little Tokyo (approximately 90 jobs). Given that Little Tokyo is fully developed, the jobs would have to be relocated in another community. Thus, Little Tokyo would necessarily lose jobs and businesses.

Displacement of properties would reduce the stock of commercial space in Little Tokyo. However, transit-oriented development could occur on properties where businesses were displaced. This development could generate additional commercial space and jobs. Still, disproportionate adverse impacts to community cohesion are anticipated.

The Underground Emphasis LRT Alternative would run primarily underground but would cross the intersection of Alameda and 1st Streets at grade. The portal and crossing here would not insurmountably divide the community. Access will be enhanced across the portal, reducing the chance of pedestrian-train conflict. No disproportionate adverse impacts associated with division of a community are anticipated.

The vehicular underpass on Alameda Street at 1st Street would provide enough frontage road to maintain delivery access for the JANM. Bus loading zones here would be displaced. Other bus loading spaces would be available adjacent to the museum on 1st Street. Additional replacement bus loading spaces could be created. School buses could still load passengers along 1st Street at the current loading zone.

The parking lot across the street from the JANM (which is the primary parking area for the museum) would not be displaced. No other culturally significant community facility would be directly impacted by the Underground Emphasis LRT Alternative. After employment of mitigation measures, direct, adverse impacts to culturally-significant community and neighborhood facilities are not anticipated.

5.4.5.2 Indirect Impacts

The loss of parking under this alternative could result in indirect disproportionate effects by decreasing business viability in Little Tokyo. Little Tokyo has expressed concern that a loss of parking could hurt businesses crucial to the area's cultural identity. The Underground Emphasis LRT Alternative could partially offset losses in parking through increasing transit access. However, local businesses that rely on paid parking lots and on-street parking could be adversely impacted. Indirect, disproportionate, adverse impacts to this minority community are anticipated.

Displacement of businesses and loss of the commercial space in Little Tokyo would have indirect, disproportionate, adverse impacts to the community. Little Tokyo is a redevelopment area. The CRA/LA focuses on redevelopment of commercial areas for economic development. The reduction in physical commercial space could greatly reduce the availability of redevelopment area. Therefore, potential for increased economic development in a primarily low-income community would be reduced.

The Underground Emphasis LRT Alternative could result in the creation of new, high-quality commercial development and related jobs in Little Tokyo. However, indirect, disproportionate adverse impacts to the Little Tokyo community are anticipated.

5.4.5.3 Cumulative Impacts

Approximately 12 new construction projects are anticipated in the project area by 2014. Fifty four new construction projects are planned between 2014 and 2018. Twelve major renovation projects are anticipated by 2014, and eight are anticipated between 2014 and 2018. Several of these projects would occur in Little Tokyo or its close vicinity and would involve the removal of public paid-parking lots. As such, parking loss that would occur under the Underground Emphasis LRT Alternative would contribute cumulatively to parking loss in Little Tokyo. Loss of parking is anticipated to have cumulative, disproportionate, adverse impacts.

5.4.6 Visual Resources and Aesthetics

The majority of the Underground Emphasis LRT Alternative alignment would run below ground. This would minimize impacts to visual resources. Surface elements of the alignment would include station entrances, portals, and pedestrian bridges.

A portal and pedestrian bridge would be located in Little Tokyo. Portal construction in Little Tokyo would remove the majority of structures in the block bounded by Alameda Street, 1st Street, 2nd Street, and Central Avenue. Depending on its final design, the pedestrian bridge could adversely impact the aesthetic character of the area. Disproportionate, adverse impacts to visual resources are anticipated.

5.4.7 Air Quality

VMT would be reduced by 833,000 miles under this alternative. A beneficial effect to criteria pollutant emissions is anticipated. No direct, indirect, or cumulative disproportionate impacts to air quality are anticipated.

5.4.8 Noise and Vibration

The operation of the Underground Emphasis LRT Alternative would have moderate noise impacts on one sensitive receptor (the Savoy residences). The Savoy is adjacent to Little Tokyo, and this would create a disproportionate noise impact.

No direct, indirect, or cumulative disproportionate adverse impacts associated with operational vibration are anticipated.

5.4.9 Geotechnical/Subsurface/Seismic/Hazardous Materials

This alternative involves the potential for intrusion of subsurface gases in the underground portions of the alignment. Underground portions of the alignment traverse a primarily minority and low-income area. Thus, exposure to subsurface gases, in particular methane, could be substantially higher for these populations. Residents of Bunker Hill and Little Tokyo could be particularly affected.

Mitigation measures have been developed to address these impacts. No direct, indirect, or cumulative disproportionate adverse impacts associated with geotechnical/ subsurface/seismic/hazardous materials are anticipated.

5.4.10 Water Quality

The project area is heavily urbanized and covered largely by impervious surfaces. The Underground LRT Alternative would not result in additional water runoff that could impact water quality in the project area. No direct, indirect, or cumulative disproportionate adverse impacts to water quality are anticipated.

5.4.11 Energy

New transit under this alternative would reduce VMT in the project area by approximately 833,300 vehicle miles. This would be a beneficial impact in the project area. Operations of new rail lines and stations would result in a less than one percent increase in consumption in the LADWP service area. Therefore, no direct, indirect, or cumulative disproportionate adverse impacts to energy consumption are anticipated. In fact, beneficial impacts to energy consumption from reduced VMT are anticipated in the project area.

5.4.12 Climate Change

Under the Underground Emphasis LRT Alternative, GHG emissions in 2035 would decrease compared to the No Build Alternative and increase compared to existing 2009 emissions due to regional growth between 2009 and 2035 unrelated to the project. These effects would be regional, not localized. Also the Underground Emphasis LRT Alternative would be consistent with SB 375 by increasing regional transportation capacity and decreasing emissions from passenger vehicles. No direct, indirect, or cumulative disproportionate adverse impacts associated with climate change are anticipated.

5.4.13 Historic, Archaeological, and Paleontological Resources

The Underground Emphasis LRT Alternative would not adversely impact historic, archaeological, or paleontological resources. No direct, indirect, or cumulative disproportionate, adverse impacts to historic, archaeological or paleontological resources are anticipated.

5.4.14 Parklands or Other Community Facilities

The Underground Emphasis LRT Alternative would not displace parkland or recreational facilities. Underground Emphasis LRT Alternative would not impede access to any community facility. Therefore, no direct, indirect, or cumulative disproportionate, adverse impacts to parklands or other community facilities are anticipated.

5.4.15 Economic Vitality and Employment Opportunities

The Underground Emphasis LRT Alternative would enhance transportation access to Little Tokyo. A potential new station at 2nd/Los Angeles Streets would benefit businesses in Little Tokyo. Another option would be to place to station at 2nd/Broadway instead, which is two blocks farther from Little Tokyo. Office Depot and Starbucks on the block bounded by Central Avenue, 1st Street, 2nd Street, and Alameda Street would be removed. This would reduce the amount of commercial space and jobs in Little Tokyo. Little Tokyo is fully developed, and it is unlikely Office Depot would relocate to another location in Little Tokyo.

However, Little Tokyo is a redevelopment area. As such, there are economic incentives for commercial redevelopment. No direct, indirect, or cumulative disproportionate, adverse impacts to economic vitality or employment opportunities are expected.

5.4.16 Safety and Security

5.4.16.1 Direct Impacts

The Underground Emphasis LRT Alternative could result in adverse impacts to pedestrian safety and security. A conflict could exist between pedestrians or vehicles and trains. A portal would be constructed adjacent to residences, museums and commercial uses with high pedestrian and vehicle traffic.

Residents around the portal would be disproportionately impacted by impacts from activity around the egress/ingress area of the proposed alignment. Underground stations could raise security concerns, particularly at night. These safety and security issues are applicable to light rail in general. They exist regardless of the socioeconomic or ethnic status of the surrounding community.

In the Little Tokyo area, Metro would offer to build a pedestrian bridge, across Alameda Street, just south of the Little Tokyo/Arts District Station. This bridge would separate pedestrian movements from LRT and motorized vehicle movements. If the community opts against construction of the pedestrian bridge, Metro would use design to enhance pedestrian safety. Metro would create pedestrian queuing and refuge areas around proposed stations. Adding wide crosswalks would also facilitate pedestrian mobility. No disproportionate, adverse impacts to safety and security are anticipated.

5.4.16.2 Indirect Impacts

There would be no indirect, disproportionate, adverse impacts to safety and security under the Underground Emphasis LRT Alternative.

5.4.16.3 Cumulative Impacts

There would be no cumulative, disproportionate, adverse impacts to safety and security under the Underground Emphasis LRT Alternative.

5.4.17 Construction Impacts

Table 5-3 shows potential construction impacts under this alternative. Table 5-3 shows whether such impacts would be disproportionately adverse.

Table 5-3. Summary of Construction Impacts for the Underground Emphasis LRT Alternative

Topic	Impact Determination	Disproportionate Impact	EJ Mitigation	Impact After EJ Mitigation

Source: TAHA, 2010

Construction of the Underground Emphasis LRT Alternative would potentially have adverse impacts associated with the following environmental topics:

- Parking and Circulation
- Visual Resources
- Community and Neighborhood Impacts
- Noise and Vibration
- Community Facilities
- Economic and Fiscal

5.4.17.1 Direct Impacts

Traffic Circulation

Construction of the Underground Emphasis LRT Alternative would result in temporary closure of several streets in the project area. In particular, construction of the Alameda Street underpass at Temple Street could result in disproportionate adverse impacts to Little Tokyo and the Japanese American National Museum. Unlike other street closures, closure of Alameda Street could be long term, unless cut-and-cover methods are used to construct the underpass. Alameda Streets is a major arterial providing access to Little Tokyo.

In addition, 2nd Street would be temporarily closed between Alameda Street and Central Avenue. Traffic would divert to 1st Street, which is already congested in Little Tokyo. Although construction impacts are short-term and intermittent, they would result in disproportionate adverse impacts.

Parking

Construction of the Underground Emphasis LRT Alternative would result in temporary displacement of on-street parking. Construction could restrict access to parking lots like the parking lot at the southwest corner of the intersection of Alameda and 1st Streets. This parking lot would be further

restricted once Alameda Street is closed for underpass construction. Restricting access to the parking lot and curb parking would have disproportionate adverse impacts to Little Tokyo and the Japanese American National Museum. Construction impacts are short-term and intermittent, but they would result in disproportionate adverse impacts.

Community Facilities

Construction of the At-Grade Emphasis LRT Alternative would temporarily restrict access to the Japanese American National Museum. Access to the museum would be decreased during construction of the Alameda Street underpass and pedestrian bridge. Loading spaces along Alameda Street would be temporarily displaced, and congestion would increase on 1st Street when 2nd Street is closed. School bus loading zones along 1st Street could be affected by construction-related traffic. Overall, access to the museum building would be maintained. Construction of the proposed 2nd Street station -Los Angeles Street Option could impede access to the Little Tokyo Library Branch. Overall, access to the library branch would be maintained. Construction impacts are short-term and intermittent, but they would result in disproportionate adverse impacts.

Visual Resources

Several large components of construction would occur near Little Tokyo including the Alameda Street underpass and pedestrian bridge. This construction could result in disproportionate adverse impacts to Little Tokyo and the Japanese American National Museum. Construction equipment and work areas in this area would be larger than most laydown areas in the alignment. Construction impacts are short-term and intermittent, but they would result in disproportionate adverse impacts.

Parklands and Other Community Facilities

During construction of the Underground Emphasis LRT Alternative, street closures could restrict access to facilities adjacent to construction sites, such as the Little Tokyo Branch Public Library and JANM, in addition to other facilities throughout the project area. Automobile and pedestrian detours would be needed. Annual festivals in the downtown area could also be temporarily affected. Emergency service response times could also be affected by the temporary street closures and detours. These construction activities would affect the entire proposed alignment. Cut-and-cover construction in the Financial District and Bunker Hill areas would require surface excavation along the entire LRT route. However, TBM construction would be used in Little Tokyo on 2nd Street, so access restrictions on 2nd Street would be limited to staging areas.

5.4.17.2 Indirect Impacts

Community and Neighborhood Impacts

Construction of the Underground Emphasis LRT Alternative would result in temporary closure of several streets near Little Tokyo. Though temporary, these closures could restrict access to businesses in Little Tokyo. Impacts to businesses would affect the entire community.

In particular, construction of the Alameda Street underpass could result in disproportionate adverse impacts to Little Tokyo and the Japanese American National Museum. A closure of Alameda Street here could be particularly long. Alameda Street is one of the main arterials providing access to Little

Tokyo. Construction impacts are short-term and intermittent, but they would result in disproportionate adverse impacts.

Economic and Fiscal

Construction of the At-Grade Emphasis LRT Alternative would result in temporary closure of several streets in the project area. Construction of the Alameda Street underpass could result in disproportionate adverse impacts to Little Tokyo and the Japanese American National Museum. A closure of Alameda Street here could be particularly long. Alameda Street is one of the main arterials providing access to Little Tokyo. Construction impacts could adversely affect the economic viability of some businesses in Little Tokyo. Construction impacts are short-term and intermittent, but they would result in disproportionate adverse impacts.

5.4.17.3 Cumulative Impacts

One major development is anticipated in Little Tokyo, the Nikkei Center. However, this alternative would not contribute cumulatively to disproportionate adverse impacts.

5.5 Fully Underground LRT Alternative – Little Tokyo Variation 1

Editor's Note: The Fully Underground LRT Alternative – Little Tokyo Variation 1 was designated by the Metro Board of Directors as the Locally Preferred Alternative and has been refined to further reduce impacts. No changes to the conclusion of this report for the Fully Underground LRT Alternative – Little Tokyo Variation 1 would occur as a result of the refinements.

The Fully Underground LRT Alternative – Little Tokyo Variation 1 would extend north from the 7th Street/Metro Center Station through a tunnel below Flower Street to a new, underground station north of 5th Street. An underground tunnel would extend east from 3rd Street to a new, underground station near 2nd and Hope Streets. The tunnel would be constructed using either the cut-and-cover method or the sequential excavation method.

A tunnel, excavated by a tunnel boring machine, would continue east beneath 2nd Street. A second, underground station would be located between Broadway and Spring Street. The tunnel would continue under Little Tokyo to a third underground station at the block bounded by Central Avenue and 1st, 2nd, and Alameda Streets. The alignment would emerge to at-grade connections with the Metro Gold Line tracks. The north-south line would connect north of Temple and Alameda Streets and the east-west line would connect on 1st Street east of Alameda Street.

Direct, indirect, and cumulative impacts under the Fully Underground LRT Alternative – Little Tokyo Variation 1 would mirror those from Underground Emphasis LRT Alternative for the following environmental justice topics:

- Transit Service Equity (Section 5.4.1)
- Parking (Section 5.4.3) (construction only)
- Displacement and Relocation (Section 5.4.4)

- Community and Neighborhood (Section 5.4.5)
- Air Quality (Section 5.4.7)
- Geotechnical/Subsurface/Seismic/Hazardous Materials (Section 5.4.9)
- Water Quality (Section 5.4.10)
- Climate Change (Section 5.4.12)
- Historic, Archaeological & Paleontological (Section 5.4.13)
- Parklands or Other Community Facilities (Section 5.4.14)
- Economic Vitality and Employment Opportunities (5.4.15)

5.5.1 Traffic Congestion

Under the Fully Underground LRT Alternative – Little Tokyo Variation 1, the intersection of Alameda Street/1st Street would remain unchanged. The proposed alignment grade would be separated from automobile and pedestrian traffic. Trains would not have to cross 1st Street when travelling to or from the Little Tokyo/Arts District Station. The traffic signal cycle at this intersection would be improved.

Under this alternative, traffic congestion would be reduced in Little Tokyo. Reduced congestion would benefit the elderly, transit-dependent population. Beneficial impacts to traffic congestion are anticipated in Little Tokyo and the project area.

5.5.2 Noise and Vibration

Operation of the Fully Underground LRT Alternative – Little Tokyo Variation 1 would not have noise or vibration impacts to the Los Angeles Hompa Hongwanji Temple on 1st Street. Therefore, no direct, indirect, or cumulative disproportionate, adverse impacts from operational noise or vibration are anticipated.

5.5.3 Visual Resources

Fully Underground LRT Alternative – Little Tokyo Variation 1 would run underground until surfacing near a connection to the Metro Gold Line. Adverse impacts to scenic resources, vistas, lighting and shade and shadows are not anticipated. However, the visual character of Little Tokyo would be impacted. The majority of the structures on the block bounded by Alameda Street, 1st Street, 2nd Street, and Central Avenue would be demolished. Therefore, direct and indirect, disproportionate, adverse impacts to visual resources are anticipated.

5.5.4 Energy

Fully Underground LRT Alternative – Little Tokyo Variation 1 would reduce VMT in the project area by approximately 1.13 million vehicle miles. This would result in a beneficial impact to the project area. New rail operations would increase energy consumption in the LADWP service area by less than one percent. Therefore, beneficial impacts to energy consumption are anticipated.

5.5.5 Safety and Security

The Fully Underground LRT Alternative – Little Tokyo Variation 1 would run almost entirely underground. Therefore, the potential for conflict between pedestrians or vehicles and trains would be low. Underground stations could raise security concerns, particularly at night. These safety and security issues are applicable to light rail in general. They exist regardless of the socioeconomic or ethnic status of the surrounding community. No disproportionate direct, indirect, or cumulative adverse impacts to safety and securities are anticipated.

5.5.6 Construction Impacts

Table 5-4 shows a comparison of construction impacts between this alternative and the Underground Emphasis LRT Alternative.

Table 5-4. Comparison of Construction Impacts under the Fully Underground LRT – Little Tokyo Variation 1 and under the Underground Emphasis LRT Alternative

Topic	Disproportionate Impact	
	Underground Emphasis LRT Alternative	Fully Underground LRT Alternative – Little Tokyo Variation 1
Traffic, Circulation, & Parking	Potentially Adverse for Parking and Circulation	Potentially Adverse for Parking during construction
Land Use & Development	Not Adverse	Not Adverse
Displacement & Relocation	Not Adverse	Not Adverse
Community & Neighborhood Impacts	Indirectly Potentially Adverse	Yes
Visual Resources & Aesthetics	Potentially Adverse	Not Adverse
Air Quality	Not Adverse	Not Adverse
Noise & Vibration	Not Adverse	Not Adverse
Ecosystems/Biological Resources	Not Adverse	Not Adverse
Geotechnical/Subsurface/ Seismic/Hazardous Materials	Not Adverse	Not Adverse
Water Resources	Not Adverse	Not Adverse
Energy	Not Adverse	Not Adverse
Climate Change	Not Adverse	Not Adverse
Historic, Archaeological & Paleontological	Not Adverse	Not Adverse

Table 5-4. Comparison of Construction Impacts under the Fully Underground LRT – Little Tokyo Variation 1 and under the Underground Emphasis LRT Alternative (continued)

Topic	Disproportionate Impact	
	Underground Emphasis LRT Alternative	Fully Underground LRT Alternative – Little Tokyo Variation 1
Parklands or Other Community Facilities	Not Adverse	Not Adverse
Economic & Fiscal	Indirectly Potentially Adverse	Not Adverse
Safety & Security	Not Adverse	Not Adverse

Source: TAHA, 2010

5.5.6.1 Direct Impacts

Parking

Construction of the Fully Underground LRT Alternative – Little Tokyo Variation 1 would temporarily displace on-street parking and could restrict access to parking lots. Access to the parking lot at the southeast corner of the intersection of 1st Street and Central Avenue could be particularly restricted. Restricting access to the parking lot and curb parking would have disproportionate adverse impacts to Little Tokyo and the Japanese American National Museum. Construction impacts are short-term and intermittent, but they would result in disproportionate, adverse impacts.

Community and Neighborhoods/Community Facilities

Construction of the Fully Underground LRT Alternative – Little Tokyo Variation 1 would temporarily restrict access to the Los Angeles Hompa Hongwanji Temple. However, access to the building would be maintained. Construction impacts are short-term and intermittent, but they would result in disproportionate adverse impacts to community facilities.

5.5.6.2 Cumulative Impacts

One major development is anticipated in Little Tokyo, the Nikkei Center. However, this alternative would not contribute cumulatively to disproportionate adverse impacts.

5.6 Fully Underground LRT Alternative – Little Tokyo Variation 2

The Fully Underground LRT Alternative – Little Tokyo Variation 2 would extend north from the 7th Street/Metro Center Station through a tunnel below Flower Street to a new, underground station north of 5th Street. At underground tunnel would extend east from 3rd Street to a new, underground station near 2nd and Hope Streets. The tunnel would be constructed using either the cut-and-cover method or the sequential excavation method.

A tunnel, excavated by a tunnel boring machine, would continue east beneath 2nd Street. A second, underground station would be located between Broadway and Spring Street. The tunnel would continue under Little Tokyo to a third underground station at the block bounded by Central Avenue and 1st, 2nd, and Alameda Streets. The alignment would emerge to at-grade connections with Metro Gold Line tracks via three portals. The portal for the north-south line would be located north of Temple and Alameda Streets. Two, staggered portals for the east-west line would be located on 1st Street east of Alameda Street.

Direct, indirect, and cumulative impacts under the Fully Underground LRT Alternative – Little Tokyo Variation 2 would mirror those from Fully Underground LRT Alternative – Little Tokyo Variation 1 for the following environmental justice topics. Although direct, indirect, and cumulative impacts for Variation 2 would be similar to those of Variation 1, it should be noted that the representatives of the Los Angeles Hompa Hongwanji Temple feel that the portal placement for Variation 2 would be more intrusive to them. The temple's board members issued a statement indicating that one of the proposed Variation 2 portals on 1st Street would be physically too close to the building's main entrance, and they prefer Variation 1 as a result.

- Transit Service Equity (Section 5.4.1)
- Parking (Section 5.4.3) (construction only)
- Displacement and Relocation (Section 5.4.4)
- Community and Neighborhood (Section 5.4.5)
- Visual Resources (Section 5.4.6)
- Air Quality (Section 5.4.7)
- Geotechnical/Subsurface/Seismic/Hazardous Materials (Section 5.4.9)
- Water Quality (Section 5.4.10)
- Climate Change (Section 5.4.12)
- Historic, Archaeological & Paleontological (Section 5.4.13)
- Parklands or Other Community Facilities (Section 5.4.14)
- Economic Vitality and Employment Opportunities (5.4.15)
- Traffic Congestion (5.5.1)
- Noise and Vibration (5.5.2)
- Energy (5.5.3)

- Safety and Security (5.5.4)
- Construction Impacts (5.5.5)

No additional analysis is required for this alternative.

6.0 POTENTIAL MITIGATION MEASURES

6.1 No Build Alternative

The No Build Alternative would not result in disproportionate adverse effects. Consequently, mitigation measures are not considered.

6.2 Transportation Systems Management (TSM) Alternative

Metro would conduct a parking needs assessment in Little Tokyo. This assessment would gauge the supply of and demand for business and resident parking in Little Tokyo. If demand exceeds supply, Metro would consider providing replacement parking for spaces lost as a result of the project. Metro would consider replacing lost parking spots for the duration of construction and operation of the project.

If parking supply exceeds demand, Metro would work with Little Tokyo and surrounding communities to show visitors and residents where parking is available. This effort could include adding signage. After implementation of these mitigation measures, adverse impacts related to parking would not be disproportionately significant.

6.3 At-Grade Emphasis LRT Alternative

6.3.1 Direct Impacts

6.3.1.1 Parking

Metro would conduct a parking needs assessment in Little Tokyo. This assessment would gauge the supply of and demand for business and resident parking in Little Tokyo. If demand exceeds supply, Metro would consider providing replacement parking for spaces lost as a result of the project. Metro would consider replacing lost parking spots for the duration of construction and operation of the project.

If parking supply exceeds demand, Metro would work with Little Tokyo and surrounding communities to show visitors and residents where parking is available. This effort could include adding signage. After implementation of these mitigation measures, adverse impacts related to parking would not be disproportionately significant.

6.3.1.2 Community and Neighborhoods

Regarding parking loss, refer to mitigation measures in Section 6.3.1.1. Upon implementation of these mitigation measures, direct impacts associated to parking loss in Little Tokyo would not be considered disproportionately adverse.

6.3.1.3 Parklands or Other Community Facilities

Construction of parts of the new alignment would remove uncontrolled mid-block left turns. Metro would maintain adequate access to businesses and community facilities near the alignment. Metro would coordinate with LADOT to create signage that would indicate new ways to access businesses affected by construction. After implementation of these mitigation measures, direct impacts to access to community facilities would not be disproportionately adverse.

6.3.1.4 Visual and Aesthetic Impacts

Metro could build a pedestrian bridge under this alternative. The pedestrian bridge would be constructed to be minimally obtrusive. However, a bridge structure would be a unique visual element in Little Tokyo. Thus, visual impacts from the bridge may be significant and unavoidable. The Little Tokyo community is a redevelopment area.

6.3.1.5 Construction Impacts

Parking spots temporarily moved by construction would be either temporarily replaced nearby in the Nikkei Center lot or signage would be created indicating locations of nearby parking structures and parking lots. Access to the Little Tokyo Library Branch, the Japanese American National Museum, and the Go For Broke Monument would be maintained during construction of the At-Grade Emphasis LRT Alternative.

Access to bus stops would be maintained, and signage would indicate changes in access where necessary. Where bus stops would be closed, bus routes would be altered accordingly, and signage would indicate these changes. Metro would work with the community to create signage showing detour routes. This would help drivers and pedestrians maintain access to Little Tokyo businesses. After implementation of these mitigation measures, construction impacts would not be disproportionately adverse.

6.3.2 Indirect Impacts

6.3.2.1 Parking

Metro would conduct a parking needs assessment in Little Tokyo. This assessment would gauge the supply of and demand for business and resident parking in Little Tokyo. If demand exceeds supply, Metro would provide replacement parking for spaces lost as a result of the project. Metro would consider replacing lost parking spots for the duration of construction and operation of the project.

If parking supply exceeds demand, Metro would work with Little Tokyo and surrounding communities to show visitors and residents where parking is available. This effort could include adding signage. After implementation of these mitigation measures, indirect impacts to parking would not be disproportionately adverse.

6.3.2.2 Community and Neighborhoods/Community Facilities

See the discussion under 6.3.2.1. After implementation of these mitigation measures, indirect impacts to community and neighborhoods would not be disproportionately adverse.

This alternative could result in long-term displacement of commercial space. Displaced commercial space in Little Tokyo could be replaced with high quality commercial development opportunities consistent with Little Tokyo's community identity. This could include a development above the portal near 2nd Street and Central Avenue, or a possible future development at the Nikkei Center. New development would create at least as many jobs as had been displaced. After implementation of this mitigation measure, indirect impacts associated with loss of commercial space in Little Tokyo would not be disproportionately adverse. The Alameda Street undercrossing and associated frontage roads would provide space for delivery activities at the JANM during operation of this alternative.

Full mitigation of the community cohesion impacts of the proposed underpass and at-grade rail junction would not possible. The new light rail service may encourage new growth that would offset the permanent conversion of the block bounded by 1st Street, Central Avenue, 2nd Street, and Alameda Street to transit facility use, but it would not necessarily occur at this central location. Disproportionate impacts would remain after mitigation.

6.3.3 Cumulative Impacts

6.3.3.1 Parking

See the discussion under 6.3.2.1. After implementation of these mitigation measures, cumulative impacts to parking would not be disproportionately adverse.

6.3.3.2 Community and Neighborhoods/Community Facilities

See the discussion under 6.3.2.1 and 6.3.3.1. After implementation of these mitigation measures, cumulative impacts to parking would not be disproportionately adverse.

6.4 Underground Emphasis LRT Alternative

6.4.1 Direct Impacts

6.4.1.1 Traffic Congestion

Mitigation measures would address impacts to intersection operations during the operation of this alternative (Transportation Technical Memorandum 2010). After mitigation measures are implemented, impacts to traffic congestion would remain significant at intersections in Little Tokyo. These disproportionate, adverse impacts would be significant and unavoidable.

6.4.1.2 Parking

Metro would conduct a parking needs assessment in Little Tokyo. This assessment would gauge the supply of and demand for business and resident parking in Little Tokyo. If demand exceeds supply, Metro would provide replacement parking for spaces lost as a result of the project. Metro would consider replacing lost parking spots for the duration of construction and operation of the project.

If parking supply exceeds demand, Metro would work with Little Tokyo and surrounding communities to show visitors and residents where parking is available. This effort could include adding signage. After implementation of these mitigation measures, impacts to parking would not be disproportionately adverse.

6.4.1.3 Displacement and Relocation

Some acquisitions and relocations would be unavoidable with this alternative. Metro would comply with the Uniform Relocation Assistance and Real Property Acquisition Regulations for Federal and Federally Assisted Programs adopted by the USDOT. All real property acquired by Metro would be appraised to determine its fair market value. Metro would provide effected property holders just compensation not less than the approved appraisal. Metro would give advanced notice to each displaced renter, business, or nonprofit organization. This notice would provide information about eligibility for aid and assistance.

6.4.1.4 Community and Neighborhoods/Community Facilities

Regarding parking loss, refer to mitigation measures in Section 6.4.1.2. After implementation of these mitigation measures, direct impacts to parking loss in Little Tokyo would not be disproportionately adverse.

This alternative could result in long-term displacement of commercial space. Displaced commercial space in Little Tokyo could be replaced with high quality commercial development opportunities consistent with Little Tokyo's community identity. This could include a development above the portal, or a possible future development at the Nikkei Center. New development would create at least as many jobs as had been displaced. After implementation of this mitigation measure, indirect impacts associated with loss of commercial space in Little Tokyo would not be disproportionately adverse. The Alameda Street undercrossing and associated frontage roads would provide space for delivery activities at the JANM during operation of this alternative.

6.4.1.5 Visual Resources

To minimize impacts associated with visual resources in Little Tokyo, Metro would design a portal trench. The portal trench would minimize the amount of track and tunnel visible to pedestrians, residences across Alameda Street and Central Avenue, and visitors to the Japanese American National Museum.

Metro could build a pedestrian bridge under this alternative. The pedestrian bridge would be constructed to be minimally obtrusive. However, a bridge structure would be a unique visual element in Little Tokyo. Thus, visual impacts from the bridge may be significant and unavoidable. The Little Tokyo community is a redevelopment area.

Metro would work with the CRA/LA to create joint development opportunities for the block bounded by Alameda Street, 1st Street, 2nd Street, and Central Avenue. Commercial space would be reduced, but Metro and the CRA/LA would work to encourage commercial and mixed-use development to replace lost jobs.

6.4.1.6 Safety and Security

In the Little Tokyo area, Metro would offer to build a pedestrian bridge, across Alameda Street, just south of the Little Tokyo/Arts District Station. This bridge would separate pedestrian movements from LRT and motorized vehicle movements. If the community opts against construction of the pedestrian bridge, Metro would use design to enhance pedestrian safety.

Metro would create pedestrian queuing and refuge areas around proposed stations. Adding wide crosswalks would also facilitate pedestrian mobility. After implementation of these mitigation measures, direct impacts to safety would not be disproportionately adverse.

6.4.1.7 Noise and Vibration

Under this alternative, a moderate noise impact from operation was predicted at the Savoy Condominiums on Alameda and 1st Streets. The noise impact would be due to track switches near the intersection of 1st and Alameda Streets. However, a spring-rail or movable frog switch could be used at this location to reduce potential noise by covering the gap in the central part of the switch. Using

this measure would reduce switch noise to a FTA criteria level of no impact. This would eliminate the disproportionate noise impact in Little Tokyo.

6.4.1.8 Construction Impacts

Parking spots temporarily moved by construction would be either temporarily replaced nearby in the Nikkei Center lot or signage would be created indicating locations of nearby parking structures and parking lots. Access to the Little Tokyo Library Branch, the Japanese American National Museum, and the Go For Broke Monument would be maintained during construction of the Underground Emphasis LRT Alternative.

Access to bus stops would be maintained, and signage would indicate changes in access where necessary. Where bus stops would be closed, bus routes would be altered accordingly, and signage would indicate these changes. Metro would work with the community to create signage showing detour routes. This would help drivers and pedestrians maintain access to Little Tokyo businesses. This would help lessen indirect, adverse effects to business viability. After implementation of these mitigation measures, construction impacts would not be disproportionately adverse.

6.4.2 Indirect Impacts

6.4.2.1 Parking

Refer to mitigation measures in Section 6.4.1.2. Upon implementation of these mitigation measures, indirect impacts associated with parking loss in Little Tokyo would not be disproportionately adverse.

6.4.2.2 Community and Neighborhoods

Refer to mitigation measures in Section 6.4.1.2. Upon implementation of these mitigation measures, indirect impacts associated with parking loss in Little Tokyo would not be disproportionately adverse.

This alternative could result in long-term displacement of commercial space. Displaced commercial space in Little Tokyo could be replaced with high quality commercial development opportunities consistent with Little Tokyo's community identity. This could include a development above the portal at 2nd Street and Central Avenue, or a possible future development at the Nikkei Center. New development would create at least as many jobs as had been displaced. After implementation of this mitigation measure, indirect impacts associated with loss of commercial space in Little Tokyo would not be disproportionately adverse. The Alameda Street undercrossing and associated frontage roads would provide space for delivery activities at the JANM during operation of this alternative.

6.4.3 Cumulative Impacts

6.4.3.1 Parking

Refer to mitigation measures in Section 6.4.1.2. Upon implementation of these mitigation measures, cumulative impacts associated with parking would not be disproportionately adverse.

6.4.3.2 Community and Neighborhoods

Refer to mitigation measures in Section 6.4.1.2. Upon implementation of these mitigation measures, cumulative impacts associated with community and neighborhoods would not be disproportionately adverse.

6.5 Fully Underground LRT Alternative – Little Tokyo Variation 1

Adverse impacts from the Fully Underground LRT Alternative – Little Tokyo Variation 1 would be similar or less adverse than impacts from the Underground Emphasis LRT Alternative, except for two additional businesses (Weiland's Brewery and Café Cuba) that would be displaced. The same mitigation analysis applies for the Fully Underground LRT Alternative – Little Tokyo Variation 1 as for the Underground Emphasis LRT Alternative.

6.6 Fully Underground LRT Alternative – Little Tokyo Variation 2

Adverse impacts from the Fully Underground LRT Alternative – Little Tokyo Variation 2 would be similar or more adverse than impacts from the Fully Underground LRT Alternative – Little Tokyo Variation 1. The Los Angeles Hompa Hongwanji Temple feels that portal placement under this alternative is more intrusive than under the Fully Underground LRT Alternative – Little Tokyo Variation 1. The same mitigation analysis applies for the Fully Underground LRT Alternative – Little Tokyo Variation 1 as for the Underground Emphasis LRT Alternative.

7.0 CONCLUSIONS

7.1 No Build Alternative

7.1.1 NEPA Findings

The No Build Alternative would include transit investment planned in the Metro 2009 LRTP. Current transit service in the project area would be maintained. Little to no construction in the project area would be associated with transit infrastructure. The No Build Alternative would not have direct, indirect, or cumulative disproportionate adverse impacts. Therefore, no mitigation measures would be required.

7.1.2 CEQA Determinations

CEQA does not list thresholds of significance specific to environmental justice. The No Build Alternative would not displace affordable housing. Thus, the project would not necessitate construction of replacement housing under CEQA. No significant impacts are anticipated under the No Build Alternative. Therefore, no mitigation measures would be required.

7.2 Transportation Systems Management (TSM) Alternative

7.2.1 NEPA Findings

The TSM Alternative would include transit investment planned in the Metro 2009 LRTP. Two new bus shuttles would be added in the project area. The TSM Alternative would result in a disproportionate loss of curb parking spaces in Little Tokyo, but this impact would not remain disproportionate after mitigation. No other disproportionate adverse impacts are anticipated.

7.2.2 CEQA Determinations

CEQA does not list thresholds of significance specific to environmental justice. The TSM Alternative would not displace affordable housing. Thus, the project would not necessitate construction of replacement housing under CEQA. No significant impacts are anticipated under this alternative. Therefore, no mitigation measures would be required.

7.3 At-Grade Emphasis LRT Alternative

7.3.1 NEPA Findings

The At-Grade Emphasis LRT Alternative would extend light rail tracks from the 7th Street/Metro Center Station to the Metro Gold Line. The tracks would meet the Metro Gold Line at a 3-way junction north of the Little Tokyo/Arts District Station on Alameda Street at Temple Street.

The following adverse impacts could weigh disproportionately on relevant communities under this alternative:

- Parking loss in Little Tokyo (direct, indirect, and cumulative impacts)
- Decreased access to public facilities during operations (direct impacts only)

- Construction-related, decreased traffic circulation, parking, access to community facilities, and changed visual resources (direct impacts only)
- Construction-related, decreased economic and fiscal viability (indirect impacts only)
- Visual impacts of the pedestrian bridge at Temple and Alameda Streets

Mitigation measures would result in any adverse impacts weighing proportionally on relevant communities, except the visual impacts of the proposed pedestrian overpass at Temple and Alameda Streets, which would be significant and unavoidable.

7.3.2 CEQA Determinations

CEQA does not list thresholds of significance specific to environmental justice. The At-Grade Emphasis LRT Alternative would not displace affordable housing. Thus, the project would not necessitate construction of replacement housing under CEQA. No significant impacts are anticipated under this alternative. Therefore, no mitigation measures would be required.

7.4 Underground Emphasis LRT Alternative

7.4.1 NEPA Findings

The Underground Emphasis LRT Alternative would extend north from the 7th Street/Metro Center Station along Flower Street. It would continue east under 2nd Street to an at-grade connection just southwest of the intersection of 1st and Alameda Streets.

The following adverse impacts could occur disproportionately on relevant communities under this alternative:

- Parking loss and permanently increased traffic congestion in Little Tokyo (direct, indirect and cumulative impacts)
- Displacement of businesses in Little Tokyo (direct impacts only)
- Decreased community cohesion in Little Tokyo due to loss of commercial space (direct and indirect impacts)
- Decreased access to public facilities during operations (direct impacts only)
- Construction-related, decreased traffic circulation, parking, access to community facilities, and changed visual resources (direct impacts)
- Construction-related, decreased economic and fiscal viability (indirect impacts only)
- Operational noise impacts at the Savoy condominium building
- Visual impacts of the pedestrian bridge at 1st and Alameda Streets and removal of structures on the block bounded by 1st Street, Alameda Street, 2nd Street, and Central Avenue

Mitigation measures would result in no adverse impacts weighing disproportionately on relevant communities, except the visual impacts of the pedestrian bridge at 1st and Alameda Streets, traffic circulation impacts, and impacts to community cohesion, which would be significant and unavoidable.

7.4.2 CEQA Determinations

CEQA does not list thresholds of significance specific to environmental justice. The Underground Emphasis LRT Alternative would not displace affordable housing. Thus, the project would not necessitate construction of replacement housing under CEQA. No significant impacts are anticipated under this alternative. Therefore, no mitigation measures would be required.

7.5 Fully Underground LRT Alternative – Little Tokyo Variation 1

7.5.1 NEPA Findings

The Fully Underground LRT Alternative – Little Tokyo Variation 1 would extend north from the 7th Street/Metro Center Station north along Flower Street. It travels east under 2nd Street to an at-grade connection just northeast of the intersection of 1st and Alameda Streets.

The following adverse impacts could weigh disproportionately on relevant communities under this alternative:

- Parking loss in Little Tokyo during construction (direct, indirect, and cumulative impacts)
- Displacement of businesses in Little Tokyo (direct impacts only)
- Decreased community cohesion in Little Tokyo due to loss of commercial space (direct and indirect impacts)
- Construction-related traffic congestion, decreased access to community facilities (direct impacts)
- Visual changes to the neighborhood due to removal of structures from the block bounded by 1st Street, Alameda Street, 2nd Street, and Central Avenue

Mitigation measures would result in no adverse impacts weighing disproportionately on relevant communities.

7.5.2 CEQA Determinations

CEQA does not list thresholds of significance specific to environmental justice. The Fully Underground LRT Alternative – Little Tokyo Variation 1 would not displace affordable housing. Thus, the project would not necessitate construction of replacement housing under CEQA. No significant impacts are anticipated under this alternative. Therefore, no mitigation measures would be required.

7.6 Fully Underground LRT Alternative – Little Tokyo Variation 2

7.6.1 NEPA Findings

The Fully Underground LRT Alternative – Little Tokyo Variation 2 would extend north from the 7th Street/Metro Center Station along Flower Street. It would continue east under 2nd Street to an at-grade connection just northeast of the intersection of 1st and Alameda Streets.

The following adverse impacts could weigh disproportionately on relevant communities under this alternative:

- Parking loss in Little Tokyo during construction (direct, indirect, and cumulative impacts)
- Displacement of businesses in Little Tokyo (direct impacts only)
- Decreased community cohesion in Little Tokyo due to loss of commercial space (direct and indirect impacts)
- Decreased access to public facilities during operations (direct impacts only)
- Construction-related, decreased parking and access to community facilities (direct impacts)

Mitigation measures would result in no adverse impacts weighing disproportionately on relevant communities.

7.6.2 CEQA Determinations

CEQA does not list thresholds of significance specific to environmental justice. The Fully Underground LRT Alternative – Little Tokyo Variation 2 would not displace affordable housing. Thus, the project would not necessitate construction of replacement housing under CEQA. No significant impacts are anticipated under this alternative. Therefore, no mitigation measures would be required.

November 24, 2009

Mr. Arthur T. Leahy
Chief Executive Officer
Metropolitan Transportation Authority
One Gateway Plaza
Los Angeles, California 90012

Re: Commendation & Appreciation

Dear Mr. Leahy:

On behalf of the Little Tokyo community, the Board of Directors of the Little Tokyo Community Council, an organization of over 100+ businesses, resident associations, religious and educational institutions and community-based organizations, would like to commend and thank the Metro Team for their hard work and efforts to develop the concept of the Fully Underground Alternative plan for consideration by the Metropolitan Transportation Authority Board of Directors for the Metro Regional Connector.

At today's meeting, the following motion was adopted by the Board of Directors:

MOTION

The Board of Directors commend and applaud the efforts of the Metro staff and the consultants for developing the concept plans of the Fully Integrated Alternative for the Regional Connector, for consideration by the Metropolitan Transit Authority Board of Directors.

The LTCC Board of Directors thank the Metro staff for listening to the concerns of the community; for creating the option specifically in response to the community's concerns by developing a conceptual plan that would clearly eliminate the at-grade train crossings at First Street and Alameda Street.

"The Little Tokyo Community Council is a nonprofit 501(c)(3) which has 90+ member organizations whose mission is to ensure that Little Tokyo would be a viable center for the Japanese American community and the Los Angeles Downtown community. The Council shall work to create a vision of what Little Tokyo should be in the future and serve as an advocate on behalf of the Little Tokyo community."

We wish to express our deep appreciation for the Metro Team's hard work and sensitivity to the community. In particular:

Dolores Roybal Saltarelli, Metro Project Manager
Ann Kerman, Metro Constituent Project Manager
Ray Sosa, CDM Consultants
Virginia Jackson, CDM Consultants
Ginny-Marie Brideau, Project Manager, The Robert Group
Clarissa Filgioun, The Robert Group

We are looking forward to continuing to work with the Metro Team on this option, which we hope will be added to the Draft Environmental Impact Statement/Report (Draft EIS/R) by the MTA Board of Directors.

Sincerely,

Bill Watanabe
Chair, Little Tokyo Community Council

Metro Regional Connector LRT
Meeting Matrix

Organization	Date	Location	Project Team Attendance *Anticipated*	Attendees	Action Items	Summary
Central City East Association	4/7/10	Central City East Association 725 S Crocker St Los Angeles	Dolores Roybal Saltarelli, Ann Kerman, Ginny Brideau	CCEA Board members and Estela Lopez		
Elected Officials Briefing	02/12/10	Metro Headquarters, Windsor Room Los Angeles	Dolores Roybal Saltarelli, Ann Kerman, Ray Sosa, Virginia Jackson, Kansai Uchida, Ginny Brideau			
Nishi Temple	02/12/10	Nishi Temple 815 E 1st St, Los Angeles	Dolores Roybal Saltarelli, Ann Kerman, Ray Sosa, Virgina Jackson			
Central City East Association	2/3/10	Central City Association – Arts District Office 948 E 2nd St Los Angeles	Ginny Brideau	Arts District Committee and Estela Lopez	None at this time	Briefed Arts District Committee on progress of study. Supportive of the Fully Underground Alternative.
Higgins Building HOA	01/25/10	Higgins Building 108 W 2nd St Los Angeles	Dolores Roybal Saltarelli, Ann Kerman, Kansai Uchida, Ginny Brideau	Higgins Building Homeowners Association Board members and property owners	Continue to provide updates as needed.	
Higgins Building HOA	01/20/10	Office of Lambert Giessinger 200 N Spring St Rm 620 Los Angeles	Dolores Roybal Saltarelli, Ann Kerman, Ginny Brideau, Helene Kornblatt, Kansa Uchida	Stacey Chaiken, Lambert Giessinger, Joan Springhetti, Martin Berg	Continue to provide updates as needed. Identify "historic preservation as art" funding options.	
Central City East Association	01/12/10	Central City East Association 725 S Crocker St Los Angeles	Diego Cardoso, Dolores Roybal Saltarelli, Ann Kerman, Ginny Brideau	Estela Lopez	Plan to attend the April 7, 2010 Board of Directors meeting. Contact owners of Fukui Mortuary and offer project briefing.	Concerned about the potential for the increased separation of the Arts District on 1st Street. Supports the FUG alternative, and looks forward to additional technical information becoming available.
Councilman Jose Huizar	01/07/10	Los Angeles City Hall Room	Diego Cardoso, Ann Kerman, Ginny Brideau	Jessica Wethington McLean	Continue to provide updates as needed.	Supports the FUG alternative, particularly with the potential for a station connecting directly to Broadway and the Bringing Back Broadway Streetcar. Wants to be sure to coordinate the construction effort in order to avoid duplicating construction impacts.

Metro Regional Connector LRT
Meeting Matrix

Organization	Date	Location	Project Team Attendance *Anticipated*	Attendees	Action Items	Summary
Central City Association	01/05/10	626 Wilshire Blvd Los Angeles	Dolores Roybal Saltarelli, Ann Kerman Randy Lamm, Devon Cichoski (For other projects)	David Wright, Sara Crestin, Jeff Moore, Gene Bougdanos, Richard Macias, Walter Okitsu, Fernando Chavez, Ryan Aubrey, RJ Noonan, Wilber Watts, Phil Recht, Jennifer Cohen, Mark Waie, Andy Leeka, Sammy Feuerci, Edward Carfdyno, Aaron Kelly, Sauli Dampour, Melani Smith, Michelle Boehm, Russ Brown, Hilary Norton	Continue to provide updates as needed.	Group approved a motion asking Metro to study the FUG alternative and supporting a station connecting to Broadway.
Little Tokyo Working Group	12/17/09	Japanese American Cultural and Community Center 244 S San Pedro St Los Angeles	Dolores Roybal Saltarelli, Laura Cornejo, Gerry Alvarez, Ann Kerman, Eric Carlson, Ann Kerman, Ray Sosa, Kansai Uchida, Ginny Brideau	Roy Nakahara, Goro Endo, Robert Volk, Kristin Fukashima, Sean Miura, Wilbur Takashima, Jerard Wright, Yukio Kawaratani , Bill Watanabe, Ron Fong, Chris Komai, Evelyn Yoshimura, Kim Tachiki-Chin, Eric Kurimura, Alan Nishio, Kei Nagao, Chris Aihara, James Okazaki, Jeff Carpenter, Jeff Liu, Satori Uyeda, Mary Graybill, Susie Tae	LTCC to begin solicitations for EIR Mitigation Consultant	The purpose of the meeting was to discuss the draft consultant agreement and updates to the potential build alternative. The agreement was positively received, with most of the questions focused on the process to identify a potential consultant. Ann Kerman presented a draft scope of work identifying the process for securing a consultant to assist the LTWG during the environmental process. A copy of this memo is attached to this document. Ann further explained that the consultant would be the choice of the LTCC, but Metro is asking the LTCC to identify a person or firm who has understanding of and expertise in light rail operations, right-of-way requirements, construction impacts, transportation planning, economic and community development, the EIS/R process, urban design, and station area planning. The consultant would work with the LTWG/LTCC until the release of the Draft EIS/R. LTCC needs to decide internally how the consultant will be managed, who will manage this person. Chris Aihara and Don Watanabe asked if Metro could provide any direction or suggestions

Organization	Date	Location	Project Team Attendance *Anticipated*	Attendees	Action Items	Summary
						on how to best reach out to the professional community. Chris Aihara wanted to set up a small committee to identify a potential consultant. The committee will meet on the 28th and 29th of December. The committee includes Chris Aihara, Alan Nishio, Ron Fong, and Yukio Kawaratani. The consultant will complete their work before the DEIS will be released to the public. Metro reviewed the decision making process, including the multiple opportunities to review and fine tune mitigations, and the station and urban designs. The consultant is not intended to replace Metro's consultant team.
Japanese American National Museum	12/16/09	Japanese American National Museum 369 W 1st St Los Angeles	Diego Cardoso, Dolores Roybal Saltarelli, Ann Kerman, Ray Sosa, Helene Kornblatt, Kansai Uchida	Akemi Kikumura, Chris Komai, Nancy Araki	Distribute electronic copy of the new build alternative Plan to brief prior to the distribution of the Draft EIS/R JANM requesting that Metro reschedule the briefing with JANM's Board of Directors	Dolores presented the conceptual designs for the "5th Build Alternative", which was well received by JANM representatives. JANM would like to see if a station entrance can be located close to JANM's main entrance. They continued to have questions about specific construction impacts and mitigations in Little Tokyo. JANM would like to know if any of the Little Tokyo buildings have been identified to be historic. Helen noted that one of the technical studies currently underway will identify properties that are recognized by the State and Federal Historic offices. Chris Komai noted his appreciation that Metro has become willing to work with the Little Tokyo community. He is hopeful that the positive relationship and continued communications will continue to improve the project as it moves forward. He is excited about the project in the current form. This combined with the Nikkei Center development will lead to the first expansion

Metro Regional Connector LRT
Meeting Matrix

Organization	Date	Location	Project Team Attendance *Anticipated*	Attendees	Action Items	Summary
						of Little Tokyo in decades.
Thomas Properties Group	12/10/09	Thomas Properties Group 515 S Flower St Los Angeles	Dolores Roybal Saltarelli, Ann Kerman, Ray Sosa, Virginia Jackson, Kansai Uchida, Ginny Brideau	Thomas Ricci, Glen Berryhill, Jeanet Babauta, Ayahlushim Hammond, Alix Wisnher, Paul Rutter, Steve Achorn, Kent Handleman	Anticipate next meeting in April Distribute mitigation measure examples to Glen Berryhill	Continued uncertainties about support for the project as a whole. Would like more information regarding the construction and operational impacts to their properties.
Little Tokyo Business Association	12/10/09	Oiwake Restaurant 122 Japanese Village Plz Los Angeles	Dolores Roybal Saltarelli, Ann Kerman, Ray Sosa, Kansai Uchida, Ginny Brideau	Elizabet Viray, Akira Yuhara, David Kudo, Wilson Liu, Shigeko Katjiya, Yuriko Shikai, Joanne Kumamoto, Frances Hashimoto	Distribute electronic copy of the new build alternative to Wilson Liu	Provided an update on the project, including presentation of the new build alternative. Group plans to take a position to support the FUG alternative.
Downtown Los Angeles Neighborhood Council	12/07/09	Los Angeles Theater 615 S Broadway Los Angeles	Dolores Roybal Saltarelli, Ray Sosa, Helene Kornblatt, Kansai Uchida, Ginny Brideau	DLANC Board of Directors	Continue to provide periodic updates to the neighborhood council	Provided an update on the project, including presentation of the new build alternative.
Savoy Homeowners Association	11/30/09	100 S Alameda St Los Angeles	Dolores Roybal Saltarelli, Ann Kerman, Ray Sosa, Virginia Jackson, Kansai Uchida, Ginny Brideau	Bobby Garza, Paul Yeh, Susie Tae, Sidney Wang, Lynne Collmann, Alfred Chang, Andrew Lin	Invite the Savoy Homeowners Association to the urban design meeting to discuss the potential Little Tokyo station.	Concerns that remain focus on potential construction impacts, and future meetings would need to discuss potential mitigation activities. The group would prefer the tunnel boring machine (TBM) be launched at 2nd and Hope Streets, rather than 2nd Street and Central Avenue. The Homeowners Association would like to work closely with Metro when deciding the construction timing and sequencing.
Little Tokyo Working Group	11/19/09	Japanese American Cultural and Community Center 244 S San Pedro St Los Angeles	Dolores Roybal Saltarelli, Ann Kerman, Gerry Alvarez, Eric Carlson, Ray Sosa, Helene Kornblatt, Clarissa Filgioun, Ginny Brideau	Complete list attached to report	Provide update on consultant procurement process and new alternative.	Presentation of grade-separated build alternative, discussion of consultant, and distribution of mitigation plan examples.
Elected Officials Briefing	11/04/09	Metro Headquarters, Windsor Room Los Angeles	Dolores Roybal Saltarelli, Ann Kerman, Ray Sosa, Virginia Jackson, Kansai Uchida, Ginny Brideau	<u>City of Los Angeles: Office of the Mayor</u> Jaime De La Vega, Maria Rountree, Borja Leon <u>Office of U.S. Representative</u>		Comprehensive Report Available

Little Tokyo Service Center	10/13/09	Japanese American Cultural and Community Center 244 S San Pedro St	Dolores Roybal Saltarelli, Ann Kerman, Ray Sosa, Monica Villalobos,			

Metro Regional Connector LRT
Meeting Matrix

Organization	Date	Location	Project Team Attendance *Anticipated*	Attendees	Action Items	Summary
		Los Angeles	Clarissa Filgioun			
Little Tokyo Working Group	10/01/09	Japanese American Cultural and Community Center 244 S San Pedro St Los Angeles	Dolores Roybal Saltarelli, Ann Kerman, Gerry Alvarez, Eric Carlson, Ray Sosa, Monica Villalobos, Yara Jasso, Helene Kornblatt, Clarissa Filgioun, Ginny Brideau	Complete list attached to report		Discuss At-Grade Emphasis impacts and potential mitigations.
Savoy Homeowners Association	09/29/09	100 N Alameda St Los Angeles	Dolores Roybal Saltarelli, Ann Kerman, Ray Sosa, Ginny Brideau	Savoy Homeowners Association members, including Paul Yeh, Susan Tae, Bobby Garza, and Lynne Collemann (Manager)	Schedule follow up meeting with Savoy's MTA Committee	Concerned about project impacts. Homeowners Association would like to meet again to discuss potential mitigations.
Little Tokyo Community Council	09/22/09	Japanese American National Museum 369 W 1st St Los Angeles	Dolores Roybal Saltarelli, Ann Kerman, Ray Sosa,	Complete list attached to report	LTCC and Metro to hold LTCC:PCPC meetings. This group is known at the Little Tokyo Working Group	Presented a project update to the full board of directors
Little Tokyo Working Group	09/17/09	Japanese American Cultural and Community Center 244 S San Pedro St Los Angeles	Dolores Roybal Saltarelli, Ann Kerman, Ray Sosa, Ginny Brideau	Complete list attached to report		Comprehensive Report Available
Little Tokyo CAC	09/16/09	Japanese American Cultural and Community Center 244 S San Pedro St Los Angeles	Eric Carlson, Ann Kerman, Ray Sosa, Ginny Brideau	Complete list attached to report	None at this time	LTCAC requested an update on the project.
MOCA Senior Staff	09/15/09	250 South Grand Avenue Los Angeles	Dolores Roybal Saltarelli, Diego Cardoso, Ray Sosa, Ginny Brideau	Charles E. Young, CEO Ari Wiseman, Deputy Director Jennifer Arceneaux, Director of Development Richard Weil, Interim CFO Lyn Winter, Director of Communications Suzanne Isken, Director of Education Michael Nauyok, Director of Operations		Metro provided a project overview, and discussed the impact the project would have on the entire LRT system. MOCA was interested in the shuttle system, and if it was possible to begin operations on that particular alternative once the study was completed. They would like additional information regarding the at-grade alternative, specifically finding out how fast the trains would travel in front of the Geffen. They are supportive of the Alameda underpass, and removing regional truck traffic, but would like to maintain a visual presence from Alameda.

Metro Regional Connector LRT
Meeting Matrix

Organization	Date	Location	Project Team Attendance *Anticipated*	Attendees	Action Items	Summary
						They are supportive of any station that would provide a direct connection to either MOCA and/or The Geffen. They would also like to see the station closest to Bunker Hill to have a unique identity, and encouraging people to visit MOCA.
City of Los Angeles: Cultural Affairs	09/02/09		Dolores Roybal Saltarelli	Edgar Garcia		Would like to participate in the TAC
Little Tokyo Community Council	08/25/09	Japanese American National Museum 369 W 1st St Los Angeles	Dolores Roybal Saltarelli, Ann Kerman, Ray Sosa, Ginny Brideau			Presented project update
Central City East Association	08/19/09	St. Xavier Catholic Church 222 S Hewitt St Los Angeles	Dolores Roybal Saltarelli, Ann Kerman, Ray Sosa, Monica Villalobos, Chris Robert, Ginny Brideau	Complete list attached to report	Continue to provide periodic updates to CCEA.	CCEA hosted a community meeting to discuss the Regional Connector. Metro staff provided an overview of the project. Questions from the community focused on the alternatives, how Metro identified the alternatives, and the price differences between each alternative. There were also questions about the Alameda undercrossing regarding construction, timing, and impacts.
Japanese Chamber of Commerce of Southern California	08/18/09	Japanese American Cultural and Community Center 244 S San Pedro St Los Angeles	Dolores Roybal Saltarelli, Ann Kerman, Ray Sosa, Ginny Brideau	Terry Handa, President of JCCSC, Lee Aoki, Mike Okamoto, Shinji Abe	Schedule meeting prior to release of Draft EIS/R	Comprehensive Report Available
Little Tokyo Community Council	08/13/09	Little Tokyo Service Center 231 E 3rd St Los Angeles	Dolores Roybal Saltarelli, Ann Kerman, Ray Sosa, Ginny Brideau	Bill Watanabe, Chair of LTCC Lee Aoki, Small Business Advocate LTSC Ron Fong, LTSC	Attend October 20th Board of Directors Meting for project briefing. Attend August 19th Planning and Cultural Preservation Committee meeting for Working Group adoption	Provided project update, discussed the development of working groups and business mitigation measures. Also discussed the decision making process, the 2nd Street stations, and project alternatives. (Comprehensive Report Available)
Little Tokyo Community Council: Parking, Planning, and Cultural Preservation	07/22/09	Japanese American Cultural and Community Center 244 S San Pedro St Los Angeles	Dolores Roybal Saltarelli, Ray Sosa	Parking, Planning, and Cultural Preservation Committee of the Little Tokyo Community Council	Address concerns at the August 5th Little Tokyo Working Group meeting	Addressed concerns of the committee on specific issues on the project. For example, they were concerned that an alternative had been chosen, discussed impacts of the underground alternative, and funding.

Metro Regional Connector LRT
Meeting Matrix

Organization	Date	Location	Project Team Attendance *Anticipated*	Attendees	Action Items	Summary
Los Angeles Conservancy	07/22/09	CDM Los Angeles Offices 523 W 6th St, Ste 400 Los Angeles	Dolores Roybal Saltarelli, Gerardo Alvarez, Ray Sosa, Monica Villalobos, Kansai Uchida, Helene Kornblatt	Jim Steely, SWCA Francesca Smith, SWCA Cara Corsetti, SWCA Mike Buhler, Los Angeles Conservancy	Meet with LA Conservancy in advance of the release of the Draft EIS/EIR to discuss the results of the historical resources analysis	Metro provided a project overview, explaining the reason for studying two possible station locations on Second Street between Broadway and Los Angeles, the impacts of the construction impacts at Little Tokyo, the project's relation to Bringing Back Broadway. Members of the Conservancy asked several specific questions, including whether: vibration impacts had been studied both during and after construction; the team had identified old buildings that will be demolished; the team had identified buildings with basements; the cost of both build alternatives being studied.
Japanese American National Museum	07/14/09	Japanese American National Museum 369 W 1st St Los Angeles	Diego Cardoso, Dolores Roybal Saltarelli, Ray Sosa, Monica Villalobos, Ann Kerman, Ginny Brideau	Miyoko Oshima, Nancy Araki, June Burke, Chris Komai	Schedule briefing for Japanese Chamber of Commerce, MOCA, Tom Kamei, Honda Plaza	The purpose of Metro's initial visit with the museum staff was to begin to understand the potential impacts to JANM, discuss potential mitigation activities, and answer questions about the project. Representatives from JANM specifically mentioned strong reservations about the "Origami Bridge" concept. They would prefer a "plaza" approach to the intersection of First and Alameda Streets. Any bridge would obscure their retail space that is located on the corner of First and Alameda. (Comprehensive Report Available)
Central City East	07/13/09	Central City East Association Offices 725 S Crocker St Los Angeles	Dolores Roybal Saltarelli, Ray Sosa, Monica Villalobos, Ann Kerman, Ginny Brideau	Estela Lopez, Qathryn Brehm	Schedule briefing for Arts District Community	Concerned that too much of the focus is on Little Tokyo impacts. Requested a briefing for the Arts District community. (Comprehensive Report Available)
Little Tokyo Community Council	07/13/09	Japanese American Cultural and Community Center 244 S San Pedro St Los Angeles	Dolores Roybal Saltarelli, Ray Sosa, Monica Villalobos, Ann Kerman, Ginny Brideau	Chris Aihara	Schedule briefing with Bill Wantanabe, incoming chair	Metro began by providing Ms. Aihara with a project update, including information about the Urban Design workshops hosted by Metro in June 2009. Ms. Aihara was concerned that the timing of the workshops seemed to imply the project is closer to construction than is the reality.

Metro Regional Connector LRT
Meeting Matrix

Organization	Date	Location	Project Team Attendance *Anticipated*	Attendees	Action Items	Summary
						One of the overarching questions was "how can we show the benefits of the project to Little Tokyo"? Ms. Aihara thought that it is difficult for the community to visualize the Regional Connector, what construction might look like, and what the project means to the neighborhood. (Comprehensive Report Available)
Thomas Properties Group	07/07/09	Thomas Properties Group Offices 515 S Flower 6th Floor Los Angeles	Robin Blair, Dolores Roybal Saltarelli, Ray Sosa, Monica Villalobos, Yara Jasso, Ann Kerman, Ginny Brideau	Thomas Ricci, Glen Berryhill, Jeanet Babauta, Stephen Achorn, Dennis Watsabaugh	Metro to provide cross section of Station Area Design	The City National Plaza is located close to 5th and Flower Streets in Downtown Los Angeles. The building is situated nearby the proposed Financial District station. This was the first informational meeting with TPG to provide background on the project, and to understand the inter-relationship between the building and the proposed station. (Comprehensive Report Available)
Los Angeles County: Public Works Los Angeles County: Flood Control	07/01/09	Los Angeles County Department of Public Works 900 S Fremont Ave Alhambra	Gerardo Alvarez, Eric Carlson, Girish Roy, Ray Sosa, Amanda Elioff, Zafer Mudar	Tsujii, Masashi Tsujii (LACDPW); Allen Ude (LACDPW); Ed Torran (LAC Flood Control); Amir Zandig (LACDPW); Bill Bowers (LACDPW)	Project Team to return with different conceptual drawings, the supporting documentation, and model runs of the existing conditions, along with a cover letter from Metro describing the project with its submittal. LACDPW and Metro to check to see if we have a cooperative agreement in place between the two agencies.	The purpose of this meeting was to initiate discussion with the Los Angeles County Department of Public Works and LA County Flood Control District (a department within LACDPW) and discuss the project's impacts on a large county storm drain running underneath Second Street near Central Ave in downtown Los Angeles as well as see if the County Department of Public Works had any additional concerns after being walked through the alignment.
City of Los Angeles: Public Works: Bureau of Engineering	06/18/09	Metro Headquarters Los Angeles	Dolores Roybal Saltarelli, Ray Sosa, Gerardo Alvarez, Monica Villalobos, Virgina Wade,	Curtis Tran, Calvin Chow, Farid Naguib	Design team to revisit current plans to minimize impacts to streets, especially with regards to	The purpose of this meeting was to discuss the design of the underpass at 1st/Alameda Streets, related issues such as the storm drain on 2nd street, the possible reconfigurations of nearby

Metro Regional Connector LRT
Meeting Matrix

			Lana Terry, Zafer Mudar		underground option	streets; and to discuss the 4th Street bridge at Flower Street.
City of Los Angeles: Transportation	06/10/09	Metro Headquarters Los Angeles	Dolores Roybal Saltarelli, Girish Roy, Gerardo Alvarez, Ray Sosa, Monica Villalobos	Kang Hu, Calvin Chow, Tom Carranza	Set up meeting with LA BOE Revisit vehicular traffic circulation in the 2nd street tunnel	Shared the conceptual plan for both alternatives
University of Southern California	05/22/09	USC: Town and Gown Building 665 Exposition Blvd Los Angeles	Diego Cardoso, Dolores Roybal Saltarelli, Ray Sosa	David Roberts (Associate Director of USC Local Government), David Galaviz (Executive Director of USC Local Government), Bing Cherrie (Associate VP of Planning of USC Capital Construction Development)	Provide updates through the project development process	Briefed the attendees of the project and illustrated its benefits to the university. The project was well received. They saw the project's potential in regards to campus life and access to the rest of county car free.
Go For Broke	05/11/09	HMC Architects 633 W 5th St 3rd Fl Los Angeles	Dolores Roybal Saltarelli, Ray Sosa, Zapher Mudar	Raymond Pan, Diane Tanaka, Edward Avila	Provide project updates as they become available.	The Go for Broke project will break ground sometime mid year of 2010. Want to know of any engineering issues with the at-grade alterative. The at-grade alternative will impact their project the most.
Little Tokyo Community Council	05/05/09	Japanese American National Museum 369 W 1st St Los Angeles	Dolores Roybal Saltarelli, Ann Kerman, Yvette Rapose, Gerry Alvarez, Laura Conejo, Ray Sosa, Monica Villalobos, Yara Jasso, Clarissa Filgioun	Executive Board of LTCC	Provide project updates as they become available.	Comprehensive Report Available
Bringing Back Broadway	05/04/09	Central City Association Offices 626 Wilshire Blvd Ste 200 Los Angeles	Ginny-Marie Case	Bringing Back Broadway Streetcar Committee	Metro to advise this group about when Metro Board of Directors will consider the LRTP. TRG staff to attend July 1, 2009 meeting	This was a regular meeting of the Streetcar, Transportation and Parking Committee of the Bringing Back Broadway organization. The agenda included a brief discussion regarding parking needs in the project area, and an update on the three potential LA Streetcar alignments currently under consideration. Comprehensive Report Available
Little Tokyo Community Council	04/28/09	Japanese American National Museum 369 W 1st St	Ann Kerman, Dolores Roybal Saltarelli, Ray Sosa	Little Tokyo Community Council	Additional meetings to be scheduled as needed	Ann Kerman, Community Relations Coordinator and the consultants presented an update report on the Metro Regional Transit Corridor Project at

1.0 SUMMARY

The alternatives under consideration for the Regional Connector Transit Corridor are: the No Build Alternative, the Transportation Systems Management (TSM) Alternative, the At-Grade Emphasis Light Rail Transit (LRT) Alternative, the Underground Emphasis LRT Alternative, the Fully Underground LRT Alternative – Little Tokyo Variation 1, and the Fully Underground LRT Alternative – Little Tokyo Variation 2. This technical memorandum discusses the potential construction-related impacts associated with the TSM Alternative and the build alternatives. Construction of any of the build alternatives is estimated to last approximately four years. Construction impacts would be temporary, short-term.

The No Build Alternative would include the transit investments already planned as described in the Metro *2009 Long-Range Transportation Plan* (LRTP). The No Build Alternative would not result in direct or indirect construction impacts. Furthermore, the No Build Alternative would not have adverse cumulative construction impacts.

The TSM Alternative would include the same transit improvements as the No Build Alternative and would also include two new shuttle bus routes that would serve as a connection between Union Station and the existing 7th Street/Metro Center Station. The TSM Alternative would not involve major infrastructure construction and, therefore, would not result in any direct or indirect adverse construction impacts. Furthermore, the TSM Alternative would not have adverse cumulative impacts during construction.

Construction of the At-Grade Emphasis LRT Alternative is anticipated to result in potentially adverse impacts related to traffic circulation; displacements and relocation; community and neighborhoods; visual and aesthetic resources; air quality; noise and vibration; geotechnical, subsurface, seismic hazards and hazardous materials; water resources; cultural/archeological resources; paleontological resources; parklands and community facilities; and economic and fiscal resources. Measures to minimize harm have been identified for these anticipated potentially adverse construction impacts. Upon implementation of these measures, the potential impacts would not be considered adverse under the National Environmental Policy Act (NEPA) and would be less than significant under the California Environmental Quality Act (CEQA), except for air quality and traffic circulation. The remaining potential impacts on air quality and traffic circulation could not be feasibly mitigated and would be significant and unavoidable. The At-Grade Emphasis LRT Alternative would also contribute to potential impacts on air quality and traffic circulation, resulting in potentially adverse cumulative impacts to air quality and traffic circulation during construction.

Construction of the Underground Emphasis LRT Alternative would result in similar construction-related potential impacts as the At-Grade Emphasis Alternative. Specifically, the Underground Emphasis LRT Alternative would potentially impact traffic circulation; displacements and relocation; community and neighborhoods; visual and aesthetic resources;

air quality; noise and vibration; geotechnical, subsurface, seismic hazards and hazardous materials; water resources; cultural/archeological resources; paleontological resources; parklands and community facilities; and economic and fiscal resources. The level of impact may be more intense than the At-Grade Emphasis LRT Alternative due to the larger volume of soil excavated and the greater potential to encounter archeological, cultural, or paleontological resources. Measures to minimize harm have been identified for these anticipated potentially adverse construction impacts. Upon implementation of these measures, impacts would not be considered adverse under NEPA and would be less than significant under the CEQA, except for air quality and traffic circulation. The remaining potential impacts on air quality and traffic circulation could not be feasibly mitigated and would be significant and unavoidable. The Underground Emphasis LRT Alternative would also contribute to potential impacts on air quality and traffic circulation, resulting in potentially adverse cumulative impacts to air quality and traffic circulation during construction.

Construction of the Fully Underground LRT Alternative – Little Tokyo Variation 1 would result in similar construction-related potential impacts as the Underground Emphasis LRT Alternative. Specifically, the Fully Underground LRT Alternative – Little Tokyo Variation 1 would impact traffic circulation; displacements and relocation; community and neighborhoods; visual and aesthetic resources; geotechnical, subsurface, seismic hazards and hazardous materials; and water resources. The level of impact may be more intense than the Underground Emphasis LRT Alternative due to the larger volume of soil excavated and the potential to encounter archeological, cultural, or paleontological resources. Measures to minimize harm have been identified for these anticipated potentially adverse construction impacts. Upon implementation of these measures, impacts would not be considered adverse under NEPA and would be less than significant under CEQA, except for air quality and traffic circulation. The remaining potential impacts on air quality and traffic circulation could not be feasibly mitigated and would be significant and unavoidable. The Fully Underground LRT Alternative – Little Tokyo Variation 1 would also contribute to potential impacts on air quality and traffic circulation, resulting in potentially adverse cumulative impacts to air quality and traffic circulation during construction.

Construction of the Fully Underground LRT Alternative – Little Tokyo Variation 2 would result in similar construction-related potential impacts as the Underground Alternative – Little Tokyo Variation 1. Specifically, the Fully Underground LRT Alternative – Little Tokyo Variation 2 would impact traffic circulation; displacements and relocation; community and neighborhoods; visual and aesthetic resources; geotechnical, subsurface, seismic hazards and hazardous materials; and water resources. The level of impact may be more intense than the other build alternatives due to the larger volume of soil excavated and the potential to encounter archeological, cultural, or paleontological resources. Measures to minimize harm have been identified for these anticipated potentially adverse construction impacts. Upon implementation of these measures, the potential impacts would not be considered adverse

under NEPA and would be less than significant under CEQA, except for air quality and traffic circulation. The remaining potential impacts on air quality and traffic circulation could not be feasibly mitigated and would be significant and unavoidable. The Fully Underground LRT Alternative – Little Tokyo Variation 2 would also contribute to potential impacts on air quality and traffic circulation, resulting in potentially adverse cumulative impacts to air quality and traffic circulation during construction.

2.0 INTRODUCTION

This Technical Memorandum describes the expected potential construction scenario for the TSM Alternative and the build alternatives. The discussion includes typical construction methods that would be used when building the Regional Connector. The construction period for the build alternatives is estimated to last approximately four years. The conditions and potential impacts described in this section would only occur during construction, and would be temporary and short-term. Some permanent impacts would begin during construction, such as the elimination of parking, and these are evaluated in other technical reports as operational impacts. The analysis in this Technical Memorandum focuses primarily on potential temporary impacts that would occur as a result of the construction process.

3.0 METHODOLOGY FOR IMPACT EVALUATION

3.1 Federal Regulatory Framework

The United States Environmental Protection Agency (USEPA) creates regulation that governs the assessment and consideration of construction impacts on the environment for various topic areas, including air quality, water quality, hazardous materials, biological resources, and cultural preservation under NEPA (42 United States Code [or USC] Section 4231). NEPA places regulatory responsibility on the federal government to "use all practicable means" to "assure for all Americans safe, healthful, productive, and aesthetically and culturally pleasing surroundings." The following federal regulations apply to the evaluation of construction effects for the proposed project.

3.1.1 Air Quality

The Federal Clean Air Act (CAA) of 1963 regulates air quality in the United States. The USEPA is responsible for enforcing the CAA and establishing the National Ambient Air Quality Standards (NAAQS). NAAQS have been established for seven major air pollutants: carbon monoxide (CO), nitrogen dioxide (NO_2), ozone (O_3), particulate matter 2.5 microns or smaller in diameter ($PM_{2.5}$), particulate matter ten microns or smaller in diameter (PM_{10}), sulfur dioxide (SO_2), and lead (Pb).

3.1.2 Water Quality

The National Pollutant Discharge Elimination System (NPDES) regulates the issuance of storm water permits necessary for projects that will require dewatering or discharge pollutants from any point source into waters of the United States. The Clean Water Act (CWA) of 1972 provides the statutory basis for the NPDES permit program. A plan must be submitted to obtain a NPDES permit, which lists potential sources of pollutants during construction, and identifies erosion prevention, sediment control, dewatering procedures and storm water management measures to be implemented during construction of the proposed project.

3.1.3 Hazardous Materials

The Resource Conservation and Recovery Act of 1976 under Title 40, Protection of the Environment of the Code of Federal Regulations (CFR), regulates hazardous wastes that may be encountered during construction activities. The Toxics Substances Control Act of 1976 regulates handling of polychlorinated biphenol (PCB) wastes encountered during construction or demolition. In addition, the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA) of 1980 regulates the handling and removal of underground storage tanks that may be encountered during construction.

3.2 State Regulatory Framework

3.2.1 Air Quality

In addition to being subject to the requirements of CAA, air quality in California is also governed by more stringent regulations under the California Clean Air Act (CCAA). The CCAA, which is governed by the California Air Resources Board (CARB), requires all air districts in the State to endeavor to achieve and maintain the California Ambient Air Quality Standards (CAAQS) established for construction activities.

3.2.2 Water Quality

The State Regional Water Quality Control Board (RWQCB) is responsible for administering water quality at the State level. Water quality during construction activity would be related to activities which encounter groundwater or affect the groundwater quality.

3.3 Local Regulatory Framework

3.3.1 Air Quality

The South Coast Air Quality Management District (SCAQMD) is the agency principally responsible for comprehensive air pollution control in the region. SCAQMD has jurisdiction over an area of approximately 10,740 square miles, consisting of Orange County, the non-desert portions of Los Angeles, Riverside, and San Bernardino Counties, and the Riverside County portion of the Salton Sea Air Basin and Mojave Desert Air Basin. SCAQMD has developed regional and localized significance thresholds for air pollutants during construction.

3.3.2 Noise

The Los Angeles Municipal Code (LAMC) Section 112.05 provides noise ordinances that specify construction hours and construction equipment noise thresholds. The noise thresholds and applicable hours of construction are as follows:

- Construction activities lasting more than one day would exceed existing exterior noise levels by ten A-weighted decibels (dBA) or more at a sensitive use.
- Construction activities lasting more than ten days in a three-month period would exceed existing ambient exterior noise levels by five dBA or more at a noise sensitive use.
- Construction activities would exceed the ambient noise level by five dBA at a sensitive use between the hours of 9:00 p.m. and 7:00 a.m. Monday through Friday, before 8:00 a.m. or after 6:00 p.m. on Saturday, or at any time on Sunday.

3.4 CEQA Guidelines

The CEQA Guidelines implicitly acknowledge that construction-related changes may be the source of significant impacts to the physical environment even though these effects may be short-term in duration. Typically, significant construction effects are identified in CEQA as changes to the physical environment that are particularly disruptive or that have specific health and safety considerations. There are no specific thresholds of significance for impacts from construction-related activities under CEQA for the following environmental topics:

- Land Use and Development
- Displacements and Relocation
- Ecosystems/Biological Resources
- Energy
- Climate Change
- Cultural/Archeological/Paleontological Resources
- Economic and Fiscal
- Growth-Inducing Impacts
- Environmental Justice

However, the potential for impacts that could occur during the construction period (although not explicitly as a result of construction activities) is presented in the respective technical memoranda for the environmental topics above.

3.4.1 Traffic Circulation and Parking

A significant transportation impact would occur if construction-related activities result in temporary short and long-term lane closures, turning prohibitions, reduced access to the circulation network, removal of parking, or secondary impacts to adjacent streets (see the Transportation Technical Memorandum for more information).

3.4.2 Community and Neighborhood Impacts

A significant community or neighborhood impact would occur if construction-related activities physically divide an established community or neighborhood.

3.4.3 Visual Resources and Aesthetics

A significant visual resource or aesthetic impact would occur if construction-related activities substantially degrade the existing visual character or quality of a significant site or its surroundings, or create a new source of substantial light or glare which would adversely affect day or nighttime views.

3.4.4 Air Quality

A significant air quality impact would occur if construction-related activities:

- Exceed SCAQMD daily regional and localized construction emissions thresholds emissions for VOC, NOX, CO, SOX, PM2.5, or PM10;
- Generate significant emissions of TACs;
- Create an odor nuisance; and/or
- Cause CO concentrations at study intersections by construction-related traffic to violate the CAAQS for either the one- or eight-hour period. The CAAQS for the one- and eight-hour periods are 20 parts per million (ppm) and 9.0 ppm, respectively. If CO concentrations currently exceed the CAAQS, then an incremental increase of 1.0 ppm over "no build" conditions for the one-hour period would be considered a significant impact. An incremental increase of 0.45 ppm over the existing conditions for the eight-hour period would be considered significant.

3.4.5 Noise and Vibration

A significant noise impact would occur if construction-related activities exceed the ambient noise level by five dBA at a noise sensitive use between the hours of 9:00 p.m. and 7:00 a.m. Monday through Friday, before 8:00 a.m. or after 6:00 p.m. on Saturday, or anytime on Sunday unless mitigated to the greatest extent feasible.

A significant vibration impact would occur if construction-related activities cause vibration damage to surrounding buildings. The potential for ground borne vibration (GBV) to cause damage to buildings varies based on the types of buildings (i.e., building materials and structural techniques) involved. The Federal Transit Administration (FTA) vibration damage criteria for various structural categories are listed below in Table 3-1.

Table 3-1. FTA Construction Vibration Damage Criteria	
Building Category and Description	**Peak Particle Velocity (PPV) (in/sec)**
I. Reinforced-concrete, steel, or timber (no plaster)	0.5
II. Engineered concrete and masonry (no plaster)	0.3
III. Non-engineered timber and masonry buildings	0.2
IV. Buildings extremely susceptible to vibration damage	0.12

Source: U.S. Federal Transit Administration's "Transit Noise and Vibration Impact Assessment Manual", May 2006. FTA-VA-90-1003-06. Table 12-3.

3.4.6 Geotechnical/Subsurface/Seismic/Hazardous Materials

3.4.6.1 Geotechnical/Subsurface/Seismic

A significant geotechnical/subsurface/seismic impact would occur if construction-related activities result in substantial damage to structures or infrastructure, expose people to substantial risk of injury; cause or accelerate instability from erosion; or accelerate wind, water erosion, and sedimentation resulting in sediment runoff or deposition which would not be contained or controlled on-site.

3.4.6.2 Hazardous Materials

A significant hazardous materials impact would occur if construction-related activities create a significant hazard to the public or environment through the routine transport, storage, use, or disposal of hazardous materials; create reasonably foreseeable accident conditions; emit hazardous emissions within one-quarter mile of an existing or proposed school; or physically interfere with an adopted emergency response plan.

3.4.7 Water Resources

A significant water resource impact would occur if construction-related activities change the direction of existing groundwater contaminants; substantially deplete groundwater supplies or recharge resulting in a lowering of the local groundwater table; alter the existing drainage pattern of the site or area, including the course of a stream or river, resulting in substantial erosion or siltation on- or off-site; create runoff water that exceeds the capacity of existing or

planned storm water drainage systems; provide substantial additional sources of polluted runoff; or otherwise substantially degrade water quality.

3.4.8 Parklands and Other Community Facilities

A significant parkland or community facility impact would occur if construction-related activities impair implementation of or physically interfere with an adopted emergency response plan.

3.4.9 Safety and Security

A significant safety or security impact would occur if construction-related activities increase pedestrian and/or bicycle safety risks or substantially limit the delivery of community safety services, such as police, fire, or emergency services, to locations along the proposed alignment.

3.5 Methodology

The analysis in this report is based on the activities outlined in the Draft Description of Construction Methods. Key considerations include potential construction methods, sequencing, phasing, staging areas, and possible effects on environmental resources. Each environmental topic area is analyzed to identify three classes of potential impacts:

- Direct Impacts – Impacts that would occur as a result of the construction process
- Indirect Impacts – Impacts that would be reasonably foreseeable future actions related to the construction process.
- Cumulative Impacts - Impacts that would result from the combined effects of the Regional Connector and other projects in the vicinity.

Multiple contractors would work on the project during the construction period. A representative phasing of construction is shown in Table 3-2. Many of the project elements could be constructed simultaneously, and the overall duration of construction would be approximately four years.

Table 3-2. Typical Phasing of Construction Activities		
Activity	**Tasks**	**Average Time Required (months)/a/**
Site Survey	Locate utilities, establish ROW and project control points and centerlines, and relocate survey monuments	4 to 6
Site Preparation	Relocate utilities and clear and grub ROW (demolition), widen streets, establish detours and haul routes, erect safety devices and mobilize special construction equipment, prepare construction equipment yards and stockpile materials	12 to 18
Heavy Construction	Construction of tunnels, street guideways including trackbed, subway stations and portals, trenches, piles, and disposal of excess material. Refinish roadways and sidewalks.	24 to 48
Medium Construction	Lay track, construct surface stations, drainage, backfill and pave streets.	12 to 24
Light Construction	Finish work, install all systems elements (electrical, signals, and communication), street lighting where applicable, landscaping, signing and striping, close detours, clean-up and test system.	4 to 6
Pre-Revenue Service	Testing of communications, signaling, and ventilation systems, training of operators and maintenance personnel	3 to 6

/a/ Some of these activities would be completed simultaneously.

4.0 AFFECTED ENVIRONMENT

This section examines the affected environment as it relates to construction activities for the proposed TSM Alternative and the build alternatives.

4.1 Area of Potential Impact

The project is located in the downtown area of the City of Los Angeles. The project area includes several communities, including the Financial District, Bunker Hill, Civic Center, Little Tokyo, Toy District, Historic Core, and Arts District. These areas are fully urbanized, and limited space is available for construction staging. Multiple community and environmental resources would potentially be impacted by construction of the TSM Alternative or the build alternatives.

4.2 General Construction Scenario

The construction activities for the TSM Alternative include installation of new bus stops and associated structures. These activities would require minimal construction equipment and would occur in the existing street and sidewalk right-of-way. The surrounding transportation infrastructure would be maintained. Construction activities would last approximately four months.

The construction duration for the build alternatives would be approximately four years. However, construction activities at any one location may be shorter. In the vicinity of cut and cover construction, surface streets would be impacted intermittently over a period of 24 to 48 months. Construction could begin simultaneously at several locations along the selected route to minimize the overall construction times. Facilities requiring the lengthiest construction work, such as tunnels, underground stations, and grade separation segments, could potentially be started first so that the entire alignment is completed at approximately the same time.

Construction of the proposed alternatives would involve conventional techniques and equipment typically used on similar projects in the Southern California region. Methods would include cut and cover excavation for certain segments of tunnels, crossovers, portals, stations and ancillary facilities and Tunnel Boring Machine (TBM) excavation for portions of the Underground Emphasis LRT Alternative and the Fully Underground LRT Alternatives beneath 2nd Street. The 2nd/Hope Street station would be constructed using either the open cut or the Sequential Excavation Method (SEM), and off-street portions of the underground alignments would be constructed using the open cut method. Also, the proposed portal on 1st Street for the Fully Underground LRT Alternative would be constructed using either the open cut or cut and cover method.

The equipment that would be used during construction may include rail-mounted vehicles, earth moving vehicles, cranes, concrete mixers, flatbed trucks, sand and gravel delivery trucks, dump trucks, and TBMs. These construction vehicles may temporarily impede traffic mobility in areas of construction and, therefore, traffic detours, designated truck routes, and off-peak hauling schedules could be required during construction. Traffic management and traffic control measures would be coordinated with the City of Los Angeles Department of Transportation (LADOT).

Construction would follow all applicable local, state, and federal laws for building and safety. The Metro Fire Life Safety Committee, composed of members from the City and County of Los Angeles Fire Departments and Metro specialists, would approve all construction methods. Working hours would be varied to meet special circumstances. Standard construction methods would be used for traffic, noise, vibration, and dust control, consistent with all applicable laws as described in the following sections.

To provide an understanding of the likely steps involved, the anticipated construction activities are described below. This potential construction sequence does not represent the order in which construction activities would be performed. Actual construction would be a complex process with many activities taking place simultaneously. Some of the construction methods and sequences would be left to the discretion of the construction contractor.

4.2.1 Utility Relocation and Street Closures

Prior to beginning construction it would be necessary to relocate, modify, or protect in place all utilities and below-grade structures which would conflict with excavations for street level track work and excavation (cut and cover sections, tunneling, and station structures). Shallow utilities that would interfere with guideway excavation work, such as maintenance holes or pull boxes, would require relocation. These utilities would be modified and moved away from the construction area.

Travel lanes would need to be temporarily occupied during utility relocation for approximately two to three blocks at a time. Closures could potentially occur in stages and alternate between opposite sides of the street. Depending on the extent of utility relocation work, construction could last up to four months on each two-block segment. Some of the major utilities (greater than 18 to 24 inches in diameter), such as the storm drains on 2nd and on Flower Streets, may require more complex construction sequences and schedules for relocations and supports. Other preconstruction activities, such as soldier piling or installation of geotechnical instrumentation, may require temporary partial street closures and the use of drilling equipment and excavators.

4.2.2 Staging Areas and Haul Routes

Temporary easements would be required at various locations for construction staging. Easements typically include portions of the sidewalk and street, and sometimes private property. The street alongside the stations and track areas, supplemented by adjacent off-street areas, would be used for construction staging and for equipment and material storage. Construction staging within the street right-of-way is also envisioned where no off-street areas can be identified.

Site clearance and demolition of existing structures at the construction staging areas would also be necessary before major construction begins. Figure 4-1 shows the location of potential staging areas along the build alternatives alignment, including the approximate footprints of the construction staging areas.

To facilitate the removal of excavated materials, haul routes to disposal sites would be predetermined by agreement with local authorities prior to construction. Routes would follow streets and highways that form the safest, shortest route with the fewest adverse effects on traffic, residences, and businesses.

4.2.3 At-Grade Construction Methods

4.2.3.1 Surface Track work

Track work construction involves demolition of the affected roadway sections, preparation of the track bed, construction of the supporting track slab, and laying of rail. Foundations for overhead catenary poles may be installed simultaneously. Construction would be performed within the parking and travel lanes identified to be permanently removed as part of the project and potentially in parallel lanes which would be impacted temporarily. Typical drilling of the shafts for catenary pole and track installation is relatively shallow. Given the urban context of the project area, approximately two-block segments of the roadway at a time are likely to be reserved for construction activities in order to achieve economies of scale and minimize the schedule. Rails would be brought to the site by truck, stockpiled at designated storage areas, welded into rail strings, and moved into place as work progresses. Construction durations for each two-block segment are estimated to be two to four months. Periodic lane closures, typically on just one side of the work zone, would be required for delivery of materials and other construction activities such as concrete pours. Construction of station platform slabs would likely be included in line segment contracts and would be coordinated with track work installation.

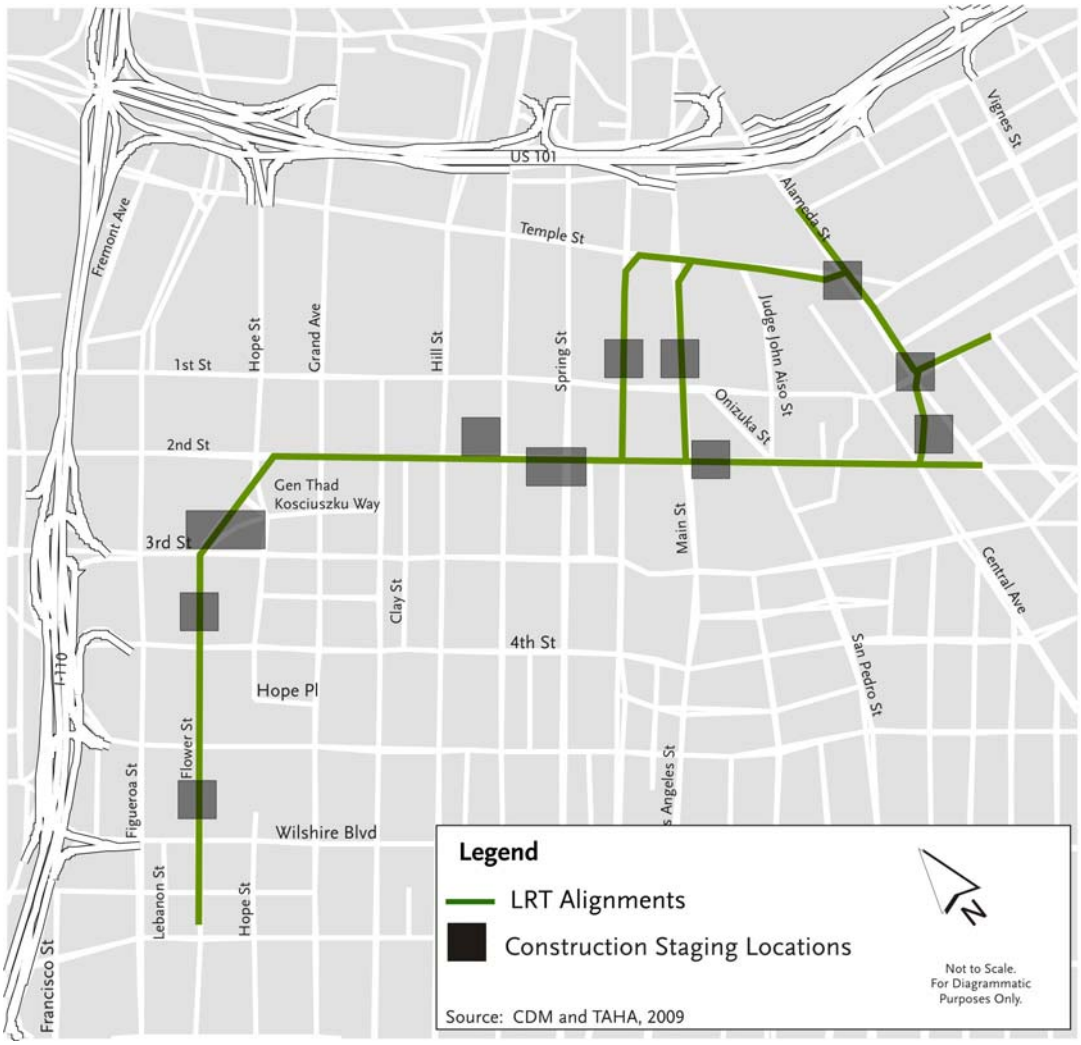

Figure 4-1. Construction Staging Area Locations

During construction within a two-block segment, cross streets and alleyways may be temporarily closed. Major cross streets would require partial closure, usually half of the street at a time, for the construction of surface stations and the light rail trackbed. Depending on allowable working hours, full blocks may require closure during excavation, preparation of subgrade, drilling for soldier pile installation, and track foundation placement. Closures would be staggered to facilitate traffic control. Where streets are not fully closed, two-way traffic could be allowed on half of the street. After the trackbed is constructed across a local street and the roadway is restored to its permanent condition, vehicles can resume planned traffic patterns (e.g. 2nd Street would have single direction traffic for the At-Grade Emphasis LRT Alternative). Rails would be brought to the sites by truck, and local rail storage areas

would be necessary for short-term storage and to facilitate placement of the rails. Equipment used for construction of surface tracks and stations would be similar to the equipment required for relocation of utilities, plus track-laying equipment, paving machines, concrete mixers, and concrete finishers. The areas of the proposed alternatives where at-grade construction is anticipated are shown in Figure 4-2.

4.2.3.2 At-Grade Stations

The at-grade station platforms on Main Street and Los Angeles Street could be constructed at the same time as other segments of the alternative, although the construction contractor may elect to construct them sequentially. Materials would be delivered to staging areas and station sites via the shortest, safest route agreed upon by local authorities. The at-grade station platforms would be constructed using standard building materials that are durable and resistant to vandalism, such as concrete, steel, aluminum, and heavy plastic. The station would consist of two single-direction platforms located along the eastern curb of Main and Los Angeles Streets.

4.2.4 Underground Construction Methods

4.2.4.1 Cut and Cover Construction

Cut and cover construction is one of various traditional construction methods for underground facilities. It entails a construction shoring system, excavating down from the ground surface, placing a temporary deck over the excavated area, constructing the underground facilities beneath the deck, and then backfilling and restoring the surface once the facilities are completed (Figure 4-3). Temporary excavation support would be provided to stabilize the ground, allowing excavation to be carried out inside the supported area. Temporary concrete decking can be placed over the cut immediately following the first part of excavation (at about 12 to 15 feet below ground surface) to allow traffic to pass above. Once the deck is in place, excavation and internal bracing would continue to the required depth. Once the desired construction is completed inside the excavated area, the deck would be removed, the excavation would be backfilled, and the surface would be restored permanently.

For the build alternatives, cut and cover construction would be utilized in various portions of the proposed alignments (Figure 4-2). These areas include underground cut-and-cover and trackway construction on Flower Street between 7th Street and 3rd Street, underground stations, crossovers, portals, and entry areas for a TBM.

Cut and cover construction would begin with the identification and relocation of utilities in the project area. Once the utilities are relocated, construction of temporary retaining walls would be required to support the soils laterally for excavation of the cut and cover tunnel, the underground station, or potential underpass to the required depths. Depending on the depth of excavation, ground conditions, proximity of adjacent structures to the proposed construction, building foundation type, and the potential for construction-induced ground

movement, an appropriate temporary support method would be selected. Temporary excavation support systems include:

- Tangent Pile Walls - reinforced concrete drilled-in-place piles which are contiguous; equipment required for installation includes drill rigs, concrete trucks, cranes, and dump trucks; or
- Secant Pile Walls - similar to tangent pile walls, but they overlap each other, providing better water tightness and ground support ; or
- Soldier Piles and Lagging, or Slurry Walls - typically constructed along the perimeter of excavation areas and involve installing soldier beams (vertical steel beams) at regular intervals and placing precast panels or other lagging materials between the beams to form the retaining wall.

Figure 4-2A Construction Methods (At-Grade Emphasis LRT Alternative)

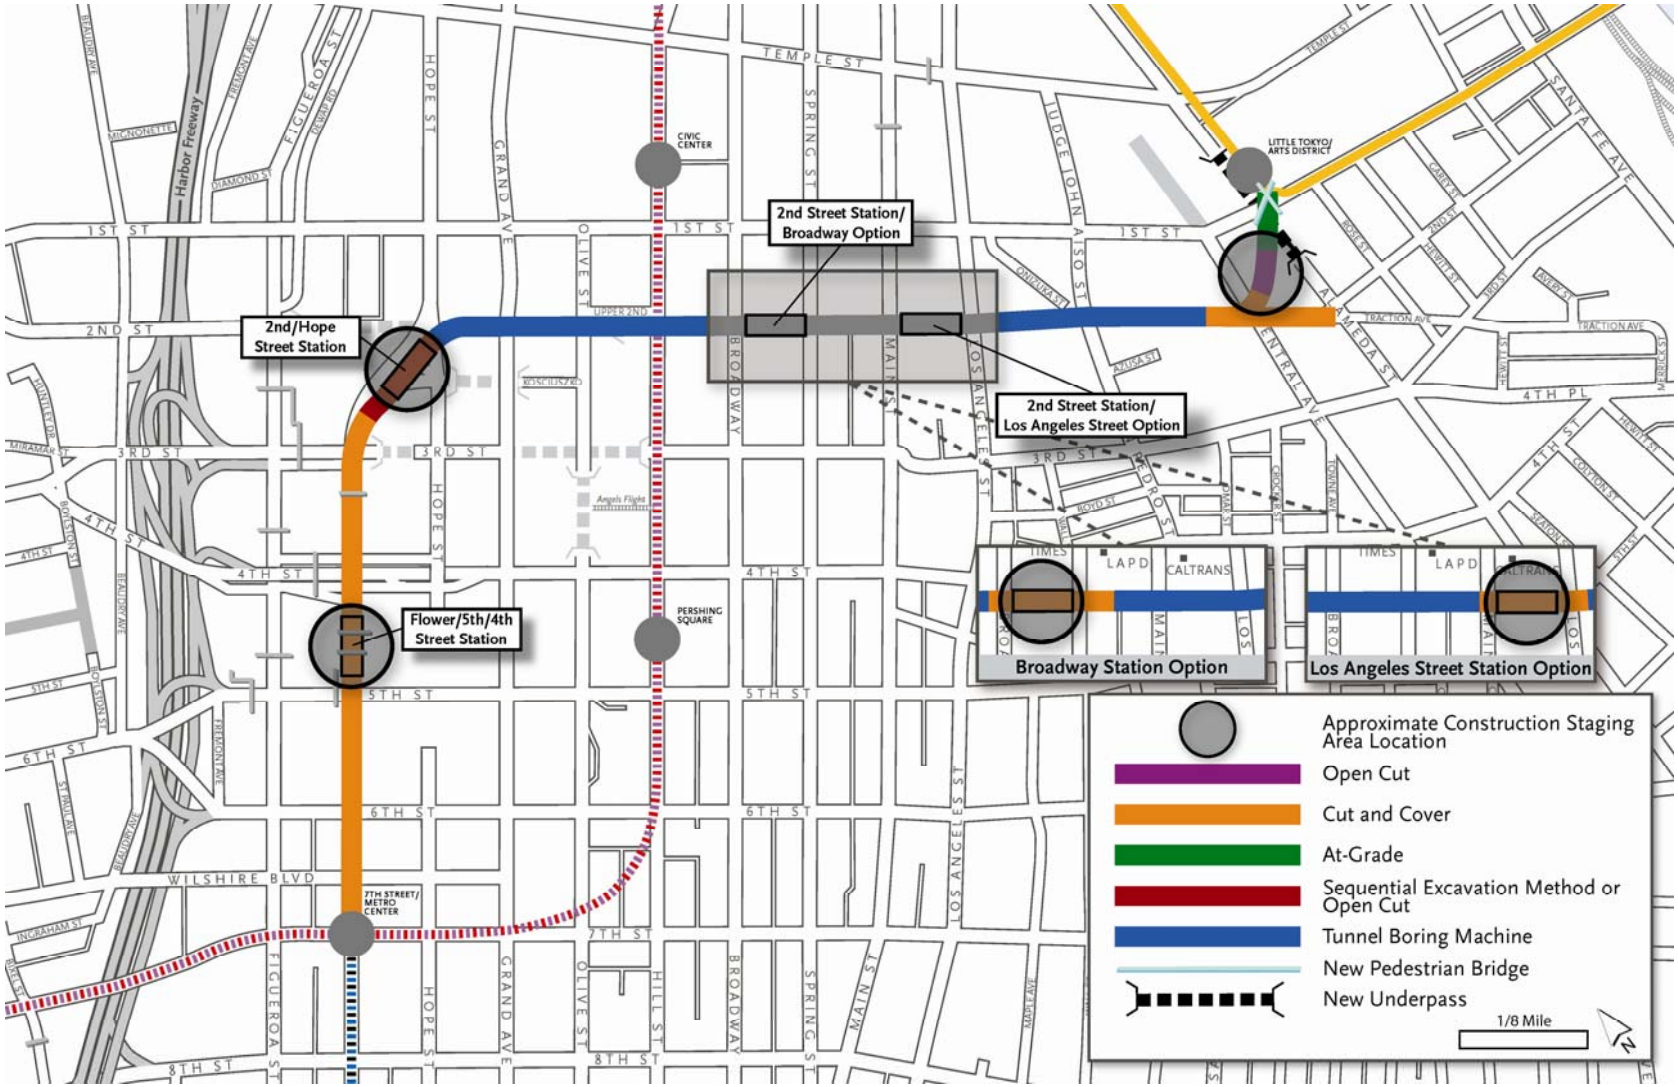

Figure 4-2B Construction Methods (Underground Emphasis LRT Alternative)

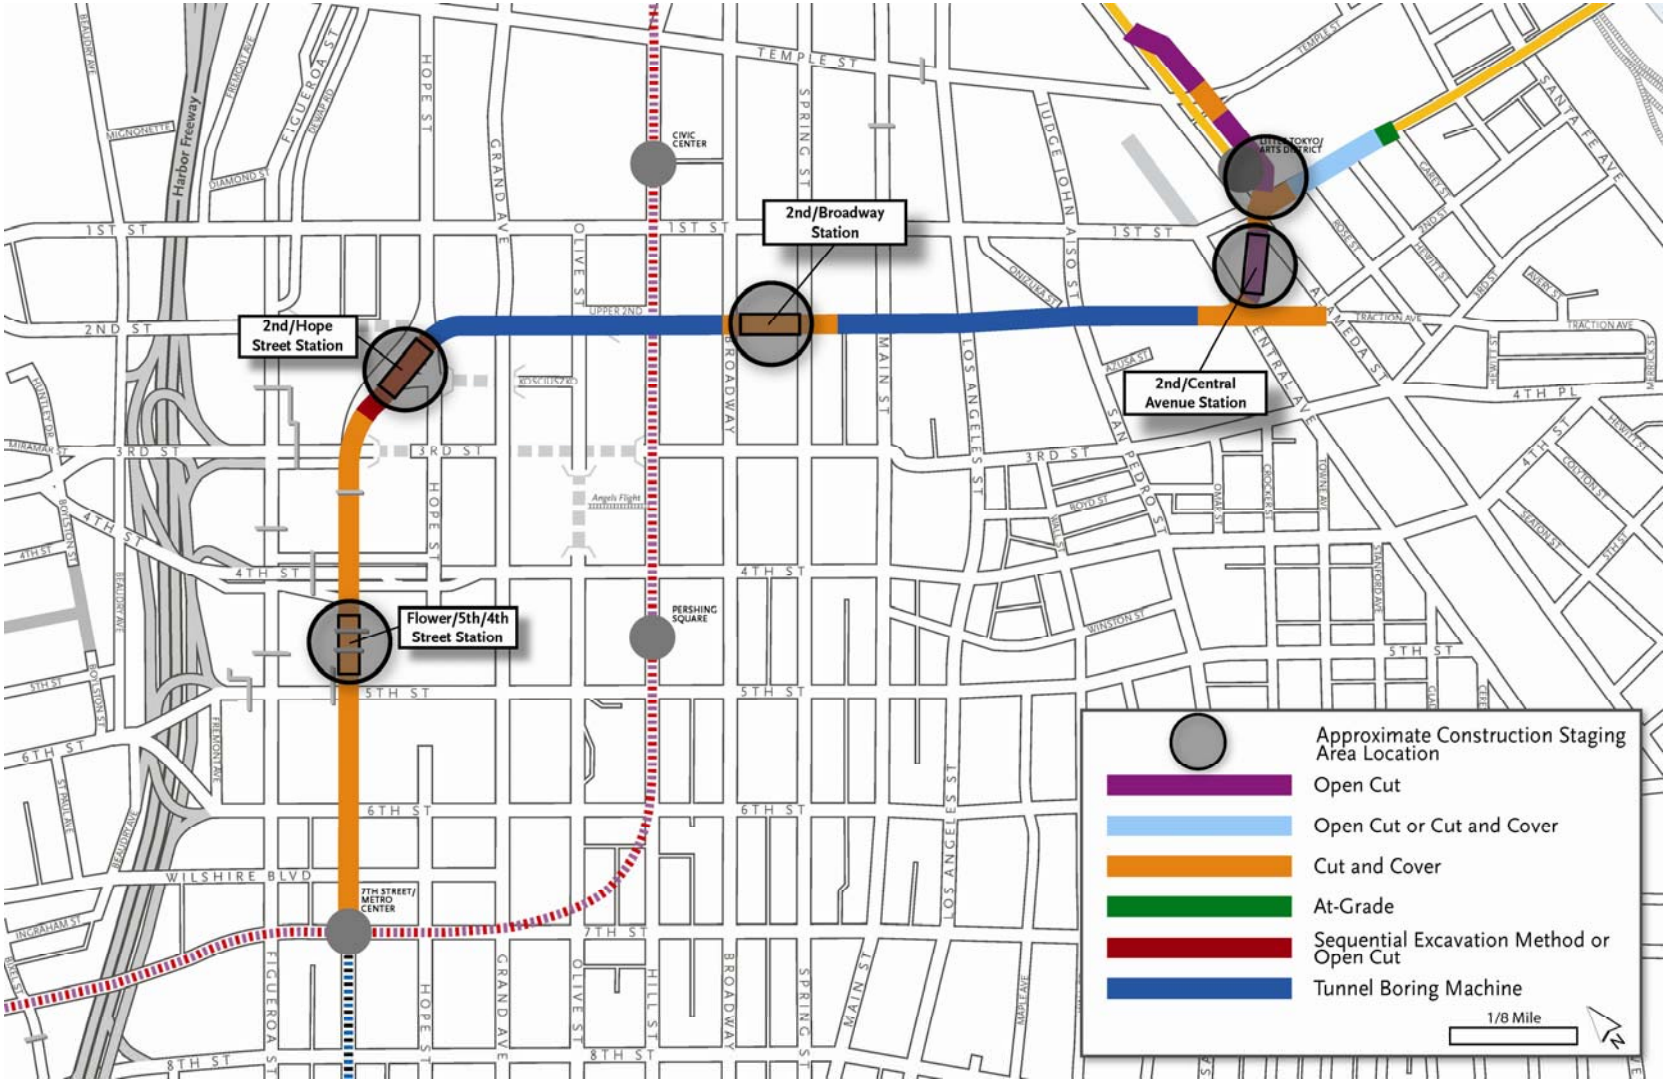

Figure 4-2C Construction Methods (Fully Underground LRT Alternative)

These wall systems would be braced with internal struts or supported by tiebacks as the excavation progresses. Tiebacks consist of horizontal or inclined wire strands or steel rods installed in drilled holes in the ground behind the wall. One end of each tieback would be secured to the wall, and the other end would be anchored to stable ground to provide sufficient resistance and to limit ground movement. Prior to the installation of a temporary ground support system, dewatering may be required at underground station locations and tunnel sites in alluvium to temporarily lower the groundwater level below the excavation depth or to an impermeable layer. Dewatering facilitates installation of soldier piles and other non-watertight shoring systems, improves soil stability, and allows excavation in dry conditions. Groundwater would be pumped from wells installed around the perimeter of the excavation.

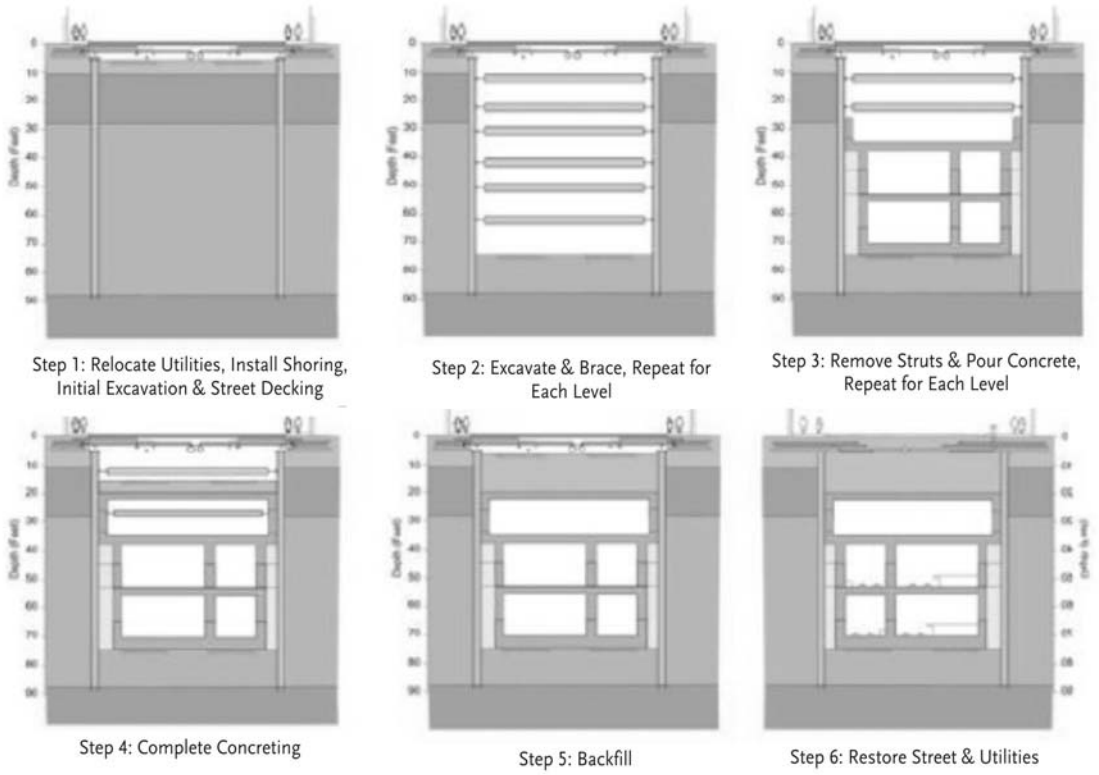
After installation of the temporary shoring support system and initial excavation, the contractor would proceed with installation of the deck beams, followed by multiple sequences of excavation and installation of cross bracing or tieback systems. Pre-cast concrete decking panels would allow traffic and pedestrian circulation to resume after the initial excavation, since they would be installed flush with existing street or sidewalk levels. Deck installation would require temporary lane closures in the cut-and-cover areas. Concrete decking would be installed in progressive stages and would require much less time than the overall station or crossover construction, which would occur underneath the street after decking is installed. Based on experience with the cut and cover construction of the two underground stations on the Metro Gold Line to East Los Angeles, after the shoring system was in place, decking installation occurred over several weekends only with non-stop activity from Friday at 5 pm to Monday morning at 6 am with community and local agency approval. Similar progressive staging could be performed for the Regional Connector. Portal construction would employ construction methods similar to those used for station excavations and retaining walls, but the portal could remain permanently open and no decking would be required during construction. However, decking may be used during construction of the portal facilities on 1st and 2nd Streets for the Fully Underground LRT Alternatives.

Cut and cover construction plans would need to address the potential presence of temporary shoring and tieback systems that were utilized during construction of the underground basements of many structures in downtown Los Angeles. Many of these temporary shoring and tieback systems were abandoned in place once building construction was completed, as is common practice in the City of Los Angeles and elsewhere in Southern California. These abandoned tiebacks could be encountered under Flower Street and 2nd Street. Steel tieback cables could also impede TBM operation.

The trackway planned under Flower Street between 7th and 3rd Street, and all underground stations and crossovers would be built with the cut and cover technique. A potential exception is the 2nd/Hope Street station where SEM construction is being considered for the Underground Emphasis LRT Alternative and Fully Underground LRT Alternatives due to the

station's depth. Open cut construction would be used for the 2nd Street/Central Avenue station for both of the Fully Underground LRT Alternatives. The activities described for

underground station construction could last up to 48 months at each underground station location. Based on the anticipated volume of excavation for the cut and cover tunnel and stations, it is estimated that an average of 20 to 30 dump truck trips per day would be required to haul and dispose of the excavated soils.



Step 1: Relocate Utilities, Install Shoring, Initial Excavation & Street Decking
Step 2: Excavate & Brace, Repeat for Each Level
Step 3: Remove Struts & Pour Concrete, Repeat for Each Level
Step 4: Complete Concreting
Step 5: Backfill
Step 6: Restore Street & Utilities

Figure 4-3. Cut and Cover Construction Method

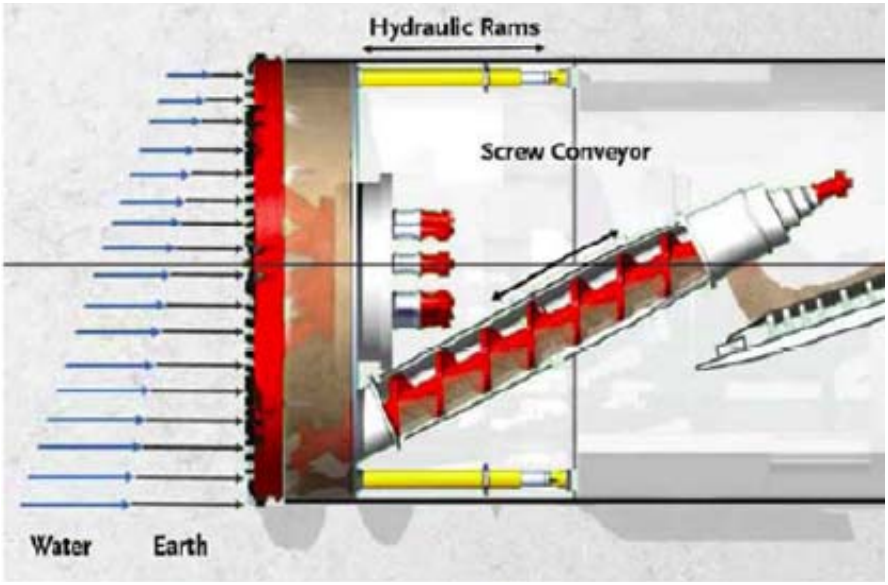
The Open Cut construction method is similar to Cut and Cover, but does not include temporary decking.

4.2.4.2 Tunnel Construction and Tunnel Boring Machine (TBM)

Portions of the Underground Emphasis LRT Alternative and both Fully Underground LRT Alternatives along 2nd Street are anticipated to be bored using a pressurized face TBM(s) (Figure 4-2). TBMs are large-diameter horizontal drills that continuously excavate circular tunnel sections. Compared to the cut and cover method, tunnel boring is far less disruptive to surface traffic and adjacent land uses. The TBM would be advanced a small distance at a time (typically four to five feet) by means of hydraulic jacks, which push against a previously installed tunnel lining ring. The hydraulic jacks would then be retracted and another tunnel

lining ring would be installed. The machine would then be advanced again and the process would be repeated until the entire length of tunnel has been constructed. The excavated materials would be removed through the tunnel using hopper type rail cars or a conveyor system. As the TBM advances, it would support both the ground in front of it and the hole it creates using a shield and pre-cast concrete tunnel liners (Figure 4-4). This method creates a tunnel with little disruption at the surface, and is especially suitable for creating a circular opening at depths that would not be practical for cut and cover construction. Concrete tunnel liner segments would have rubber gaskets between them where necessary to prevent water from entering the tunnel, allowing excavation to proceed below the groundwater level.

TBMs require a launching shaft to start the tunneling operation. One option for a launching shaft for the TBM would be planned near the east end of the project, on 2nd Street between Central Avenue and Alameda Street. From the east end, the machine would bore westward along 2nd Street towards the 2nd/Hope Street Station site, passing through the proposed 2nd Street station area at either Broadway or Los Angeles Streets. The TBM would then be dismantled and retrieved through a vertical shaft created by cut and cover method adjacent to the 2nd/Hope Street Station. It would then be transported back to the launching shaft, and reassembled to repeat its journey for the second twin tunnel. An alternative tunnel boring approach is possible that would use a single, larger diameter tunnel instead of two smaller diameter tunnels. A single large TBM could be used to bore one tunnel big enough to contain both tracks and possible the station platforms. Further studies will determine if such an approach would be feasible for the Regional Connector. The TBM could also be launched from 2nd and Hope Streets and travel east toward 2nd and Alameda Streets. Launching two TBMs simultaneously from each end is an option as well.



Source: CDM 2009

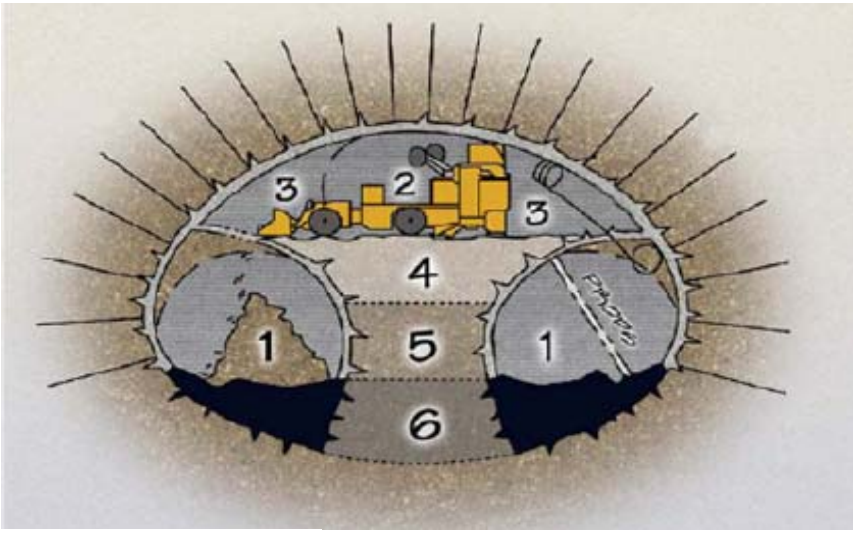
Figure 4-4. Tunnel Boring Machine (TBM) Method

The pre-cast concrete liners would be fabricated off-site and delivered by truck. Segment delivery would require 6 to 10 truck trips per day for the duration of tunneling, assuming an average excavation rate of 30 to 50 feet per day for a single tunnel. Should simultaneous tunneling occur, 12 to 20 truck trips would be required for segment delivery. Tunneling operation would typically be continuous, occurring seven days a week with two 10-hour shifts per day.

4.2.4.3 Sequential Excavation Method (SEM)

SEM construction involves excavating incrementally in small areas and supporting with steel supports beyond the opening and sprayed concrete as shown in Figure 4-5. Whereas TBMs can only excavate a fixed circular shape, SEM permits construction of a tunnel with a horseshoe or sub-rounded shape. This construction technique is considered in special instances where the planned depth, shape, or length of the tunnel may render it not cost effective using other methods. All operations would be conducted from an access shaft for spoils removal and future entrance(s). The sequence of excavation for the SEM method would be determined during the design stage and controlled and modified as needed during construction based on actual conditions encountered. After all of the predetermined sequence areas are excavated and supported, the larger area of the station would be completed.

Because of the depth of the 2nd/Hope Street station for the Underground Emphasis LRT and Fully Underground LRT Alternative – Little Tokyo Variations 1 and 2 , SEM construction is being considered as an alternative to the open cut method. Application of SEM would have less surface interruption than the cut and cover method since the excavation would be performed mostly underground and accessed via a vertical shaft.



Source: CDM. 2009

Figure 4-5. Sequential Excavation Method (SEM)

4.2.5 Additional Construction Activities

4.2.5.1 Construction of Underground Station and Portal Structures

The construction sequence for the station structure would begin with excavation of the station box, followed by the pouring of the foundation base slab, followed by the installation of exterior walls and any interior column elements. Slabs would be poured as the columns and intermediate floor and roof wall pours progress. Portal structures would use similar construction methods involving placement of concrete inverts, walls, and walkways. Station entrance locations would likely be used as access points to the underground station during the construction process. Exterior entrances would be constructed after the station structure has been completed.

4.2.5.2 Foundations and Tunnel Connection

Under the At-Grade Emphasis LRT Alternative, the connection to the existing 2nd Street Tunnel would require installation of a temporary shoring system, construction of retaining walls to support soil removal, reinforcement of the tunnel structure, and installation of supporting elements at the location of the new openings. This would not be required for the Underground Emphasis LRT Alternative, or the Fully Underground LRT Alterative Little Tokyo Variations 1 or 2.

4.2.5.3 Grade Separations

For the At-Grade Emphasis LRT Alternative, an underpass would be constructed at the intersection of Temple and Alameda Streets. For the Underground Emphasis LRT Alternative, an underpass would be constructed at the intersection of 1st and Alameda Streets. No underpass or pedestrian bridge would be required for the Fully Underground LRT Alternatives. The underpass would allow through traffic on Alameda Street to pass beneath Temple Street (At-Grade Emphasis LRT Alternative) and 1st Street (Underground Emphasis LRT Alternative) and the new rail junctions. In addition, pedestrian bridges could potentially be constructed above the Alameda Street underpass that would span the respective intersections for the At-grade Emphasis LRT Alternative and the Underground Emphasis Alternative. A pedestrian bridge could also possibly be constructed from the 2nd/Hope Street station to Upper Grand Avenue for all of the build alternatives. Bridge construction would involve heavy construction equipment, including cranes for erection of the structure. Underpass construction would involve installation of an appropriate shoring system followed by excavation to the required depth of the underpass. Lane closures and traffic rerouting would be required during construction. Currently, an existing modular wall system provides support for the existing rails at the Temple Street and 1st Street intersections. Lowering Alameda Street in these areas would require either underpinning the existing wall or constructing a new, higher replacement wall.

4.2.5.4 Operating Systems Installation

Operating systems for all of the build alternatives would include traction power, an overhead catenary system (OCS), a communications system, and a signal system. An OCS consists of poles connected to drilled shaft foundations with overhead wires to supply power to the trains. Within the tunnel segments, the OCS would be connected to the top of the tunnels. The system would include Traction Power Substations (TPSS) to provide direct power to the trains. TPSS facilities would include ground systems and prefabricated units which are placed on foundation slabs by crane and connected to the system. Construction equipment would include high rail vehicles for installation of the wires from the guideway area. While wires are being strung at cross streets, temporary street closures of a few hours at suitable times are anticipated. TPSS equipment would need to be installed adjacent to the alignment along at-grade segments, or within station boxes along underground segments.

4.2.5.5 Ventilation Shafts and Emergency Exits

The underground segments would include a number of ventilation and emergency exit areas in the vicinity of the underground stations. The stations would house emergency ventilation fan shafts, as well as separate emergency exit shafts at both ends of the stations. Ventilation fans would be installed to extracting smoke from tunnels and stairs for evacuation in the event of an emergency, such as a fire in the underground areas. The exact location of these facilities would be determined during the final design. These shafts would be built as extensions of the station excavations using cut and cover construction methods.

5.0 IMPACTS

This section addresses the construction-related adverse effects of the proposed alternatives, based on the implementation of the construction scenario described in Section 4. Each environmental topic that would have potential construction impacts is discussed. In addition, permanent impacts that would begin during the construction period are also identified, though they are analyzed in more depth in other technical reports.

5.1 No Build Alternative

Under the No Build Alternative, transit infrastructure investment would be limited to improvements planned for and funded in the 2009 Metro LRTP. By 2035, the Metro Expo Line to Santa Monica, Metro Purple Line to Westwood, Metro Crenshaw Line, and the Metro Gold Line to Azusa and I-605 will be in operation, and a number of bus services will have been reorganized and expanded to provide connections with these new rail lines. The transit network within the project area would otherwise be largely the same as it is now.

5.1.1 Direct Impacts

The No Build Alternative does not include the construction of any new facilities in the project area. Therefore, there would be no direct construction impacts under the No Build Alternative.

5.1.2 Indirect Impacts

The No Build Alternative does not include the construction of any new facilities in the project area. Therefore, there would be no indirect construction impacts under the No Build Alternative.

5.1.3 Cumulative Impacts

The No Build Alternative does not include the construction of any new facilities in the project area. Therefore, there would be no cumulative construction impacts under the No Build Alternative.

5.2 Transportation System Management (TSM) Alternative

Under the TSM Alternative, in addition to the provisions of the No Build Alternative, there would be two new express shuttle bus lines linking the 7th Street/Metro Center Station and Union Station. These buses would run frequently and may also have traffic signal priority similar to the Metro Rapid system to assist in the movement of buses within projected future traffic conditions. The traffic signal priority system grants longer green lights to oncoming transit vehicles. Enhanced bus stops would be located every two to three blocks, so as to maximize coverage of the area surrounding the routes. These new shuttles would also have minor associated structures, such as bus stops and signage. In addition, the same

infrastructure investments that would occur under the No Build Alternative would also occur under the TSM Alternative.

5.2.1 Direct Impacts

The TSM Alternative does not include the construction of any substantial new transit infrastructure. Transit infrastructure and improvements would be limited to the installation of new bus shelters and associated safety features. Construction of these facilities would occur on small localized sites and would occur over a very short term (days) compared to the Build Alternatives (years). Therefore, the TSM Alternative is not anticipated to result in any adverse environmental impacts.

5.2.2 Indirect Impacts

The TSM Alternative does not include the construction of any substantial new transit infrastructure. Transit infrastructure and improvements would be limited to the installation of new bus shelters and associated safety features and are not anticipated to result in any indirect adverse construction impacts.

5.2.3 Cumulative Impacts

The TSM Alternative does not include the construction of any substantial new transit infrastructure. Transit infrastructure and improvements would be limited to the installation of new bus shelters and associated safety features and are not anticipated to result in any cumulative adverse construction impacts.

5.3 At-Grade Emphasis LRT Alternative

The At-Grade Emphasis LRT Alternative extends from the underground 7th Street/Metro Center Station, heads north under Flower Street, resurfaces to at-grade north of 4th Street, crosses 3rd Street at-grade, enters Bunker Hill, and turns northeast through a new entrance to the existing 2nd Street tunnel. The alignment continues along 2nd Street and it splits into an at-grade couplet configuration traveling north on Main and Los Angeles Streets (one track on each roadway). It then heads east on Temple Street, realigns into a dual track configuration just east of Los Angeles Street, and connects to the Metro Gold Line tracks in a 3-way junction north of the Little Tokyo/Arts District Station on Alameda Street. Due to the high volume of trains that will traverse the Regional Connector Transit Corridor, an automobile underpass and pedestrian overpass will be constructed at the Temple and Alameda Streets to eliminate potential pedestrian-train and automobile-train conflicts. To implement this alternative, the number of traffic lanes and on-street parking on Temple Street, Main Street, Los Angeles Street, Flower Street and 2nd Street will be reduced.

Construction of the At-Grade Emphasis LRT Alternative would consist of the activities listed in Table 5-1. The At-Grade Emphasis LRT Alternative would require utility relocation and street

closures, staging areas necessary for equipment storage of excavated material, haul routes for construction equipment, the laying of surface track work, building of stations and portal structures, cut and cover construction, and excavation or installation of foundations. The analysis of the potential impacts that these construction activities could have are discussed for all environmental topic areas except for Land Use and Growth-Inducing Impacts because construction activities do not tend to have impacts in these topic areas.

5.3.1 Traffic and Parking

5.3.1.1 Direct Impacts

Permanent Impacts During Construction

Construction of the At-Grade Emphasis LRT Alternative would result in the permanent loss of approximately 47 on-street parking spaces and 33 on-street loading spaces, including 23 on-street parking spaces and five loading spaces on 2nd Street during off-peak hours. Three bus loading spaces in front of the Japanese American National Museum (JANM) on Alameda Street would be eliminated, but additional spaces are available on 1st Street, and replacement spaces would be identified in close proximity to the museum. The loss of on-street parking would result from the placement of tracks along streets. The details of these impacts and mitigation measures are presented in the Transportation Impacts Technical Memorandum and in the Displacement and Relocation of Existing Uses Technical Memorandum.

Table 5-1. Construction Activity Summary for the At-Grade Emphasis LRT Alternative

Activity	Duration (months)	Construction Equipment							Soil (CY)	Concrete (CY)	Truck Trips Per Day	Workers Per Day
		Haul Trucks	Concrete Truck	Dozer	Excavator	Crane	Drill Rig	Flatbed

Construction-Related Impacts

Construction of the At-Grade Emphasis LRT Alternative would require the loss of on-street parking and reduction in travel lanes in certain locations. In most instances, these would be temporary conditions during the construction phase. In areas designated for cut and cover construction, the top two to three feet of the roadway would be removed and decking would be installed over an approximate three- to four-month period. Construction of the stations would continue underground while traffic operates normally on the decking. This procedure would require temporary off-peak, nighttime or weekend street closures to install the decking. The closure schedules would be coordinated to minimize impacts to residences, businesses, and traffic flow. During these times, traffic would be rerouted to adjacent streets via clearly marked detours.

Utility relocations, construction of the trackway, stations, and the proposed Alameda Street underpass at Temple Street would require the temporary closure of lanes on Flower Street, Hope Street in the vicinity of General Thaddeus Kosciuszko Way, Main Street, Los Angeles Street, Temple Street, 2nd Street, and Alameda Street. The track construction and permanent street configuration along 2nd Street would result in the elimination of eastbound vehicular travel on the segment of roadway between Hill Street and Main Street as well as the permanent closure of one eastbound travel lane between Main Street and Los Angeles Street. For the westbound direction of 2nd Street, a one lane permanent closure has been identified between Hill Street and Los Angeles Street. Travel times for vehicles traveling along the westbound direction of 2nd Street are expected to increase and eastbound vehicular through traffic would shift to 4th and 1st Streets. This shift would result in increased delay at several intersections between Hill Street and Los Angeles Street. Vehicular travel times and intersection operations along these roadways would potentially be impacted.

The construction of the proposed Alameda Street underpass at Temple Street would also result in the temporary reduction of roadway capacity for extended periods of time. In order to maintain two through travel lanes in each direction during construction activities, the two-way left turn median in the mid-block area and the exclusive right and left turn lanes at the intersection approaches would be temporarily eliminated over the two to three year period estimated to construct the underpass. The north and south intersection lane configurations would consist of a shared through and right turn lane and a shared through and left turn lane for the segment of Alameda Street between Aliso and 1st Streets. The existing signal phasing may be changed to split phasing in order to minimize conflicts between left turns and opposing through movements. This would minimize the formation of queues that could result from a vehicle waiting for a gap in the opposing traffic to complete a left turn movement. Consequently, travel times along this segment of Alameda Street are expected to increase due to the potential for additional traffic congestion. Also, operating conditions for the Alameda Street intersections between Aliso and 1st Streets are expected to experience increased delays.

Construction of the At-Grade Emphasis LRT Alternative would require use of heavy-duty trucks to transport equipment and excavated soil. The addition of these truck trips to the existing street network has the potential to adversely affect traffic. Haul and delivery truck routes would affect residents and commuters along the alignment. Soil hauling, rail and catenary deliveries, and general construction traffic would impact traffic flow patterns as well. Roadway surface restoration may be needed in areas that experience frequent project-related truck trips. These would be temporary conditions during the construction phase.

Existing on-street parking spaces and loading stalls would be temporarily removed during construction. This would potentially impact parking space and loading areas on the east and west sides of Flower Street, the loading areas on the east side of Main and Los Angeles Streets, and the parking spaces on the south side of Temple Street. In addition, the realigned intersection of Hope Street in the vicinity of General Thaddeus Kosciuszko Way may temporarily remove several parking spaces along both the east and west sides of the roadway segment. The track construction and permanent street configuration along 2nd Street would result in the temporary removal of several parking and loading stalls. Adjacent to the Alameda Street underpass, the JANM tour bus loading zone on the west side of the street would be temporarily relocated for the duration of the construction period.

Track construction, permanent street configuration changes along 2nd Street, and the construction of an underpass on Alameda Street may also require temporary sidewalk detours. As noted earlier, the construction along 2nd Street would shift some of the through traffic movements on to 1st Street, which is designated as a Class III bicycle route. Consequently, the flow of bicycle traffic could be hampered due to increased auto traffic volumes on 1st Street. The additional automobile traffic would result in increased turning movements, potentially reducing bicycle operating speeds or resulting in a greater risk of bicycle-automobile conflict, since Class III routes do not have bicycle-designated lanes. The construction of the underpass on Alameda Street may result in localized shifts in traffic to adjacent streets such as Central Avenue, which is also designated as a Class III bicycle route. Similarly, the increase in traffic volumes could potentially impact the flow of bicycle traffic. Temporary sidewalk detours during the construction of this alternative would also impact pedestrian flow.

Restoration of these parking, pedestrian and bicycle circulation, and travel lanes to their permanent configurations would occur prior to operations. Although short term, potentially adverse impacts are anticipated during construction of this alternative.

5.3.1.2 Indirect Impacts

Impacts from construction-related activities would be temporary and direct in nature. There would be no indirect impacts affecting traffic circulation or parking under the At-Grade Emphasis LRT Alternative.

5.3.1.3 Cumulative Impacts

Impacts to traffic circulation during construction would be short-term. They would contribute to a cumulative adverse effect when combined with additional projects in the downtown area. Therefore, potential cumulative adverse traffic circulation impacts are anticipated under the At-Grade Emphasis LRT Alternative.

5.3.2 Displacements and Relocation

5.3.2.1 Direct Impacts

Permanent Impacts During Construction Period

To construct the At-Grade Emphasis LRT Alternative, 11 parcels would be partially acquired at different locations along the alignment. These properties would be utilized for TPSS facilities, construction staging, below grade tunneling, and stations. Details of these impacts and mitigation measures are presented in the Displacements and Relocation of Existing Uses Technical Memorandum.

Construction-Related Impacts

During construction of the At-Grade Emphasis LRT Alternative, staging of construction equipment and materials would require temporary construction easements that would impact two parcels. The portions of these parcels that would be utilized would be plazas and open areas. Access to businesses and buildings would be maintained. Some sidewalk detours would be necessary. Mitigation would minimize the adverse impacts associated with this type of displacement during construction. In addition, once construction is completed, the sites would be restored to their permanent conditions.

5.3.2.2 Indirect Impacts

Displacement impacts are direct in nature. Therefore, no indirect construction impacts associated with displacement are anticipated.

5.3.2.3 Cumulative Impacts

During construction, two temporary construction easements would be required. Given the temporary nature of these easements, the project is not anticipated to contribute to cumulative adverse construction impacts.

5.3.3 Community and Neighborhoods

5.3.3.1 Direct Impacts

Mobility would be reduced in the Civic Center, the Historic Core, and Little Tokyo areas due to street closures associated with construction activities including track work, cut and cover excavation, and structural support work. Disruption of traffic patterns would require detours for persons accessing nearby residences and businesses. In Little Tokyo, disruption to traffic

along Alameda Temple Streets would directly affect cultural institutions such as JANM, the Go For Broke Monument, and the Museum of Contemporary Art (MOCA) and other businesses during the excavation and construction of the Alameda Street underpass and the potential pedestrian bridge. Without mitigation, potential adverse construction impacts associated with community and neighborhoods are anticipated under the At-Grade Emphasis LRT Alternative.

5.3.3.2 Indirect Impacts

During utility relocation, mobility would be reduced in the Civic Center, Historic Core, and Little Tokyo areas. Disruption of traffic patterns would require detours for persons accessing nearby residences and businesses. This could impact the economic vitality of some businesses, particularly in Little Tokyo, where the community has expressed concern about construction activities. Prolonged disruption to businesses could affect the cohesion of some communities, including Little Tokyo. Without mitigation, potential adverse indirect construction impacts associated with community and neighborhoods are anticipated under the At-Grade Emphasis LRT Alternative.

5.3.3.3 Cumulative Impacts

No cumulative adverse construction impacts are anticipated under the At-Grade Emphasis LRT Alternative.

5.3.4 Visual Resources and Aesthetics

5.3.4.1 Direct Impacts

Views and Visual Character

During construction of the At-Grade Emphasis LRT Alternative, several construction staging areas would be utilized. Construction areas would be protected by barriers. The placement of concrete barriers and fencing would be visible from multi-family residences and other sensitive uses adjacent to the alignment, particularly the Bunker Hill Towers, the Higgins Building, Hikari, and Savoy. Viewers would see construction equipment, construction-related activities, stockpiles of dirt and debris, and the urban streetscape would be temporarily altered. Screening of construction staging areas would minimize aesthetic impacts at street level. The project would be constructed in a heavily urbanized environment where construction activities are not uncommon, and the construction of the project would not noticeably reduce visual quality or alter viewing context. In Little Tokyo, large construction equipment would be required for the excavation and construction of the Alameda Street underpass and of the potential pedestrian bridge. This impact would be temporary and would be considered less than significant. Overall, less-than-significant impacts associated with views and visual character are anticipated due to construction activities.

Lighting

Temporary lighting may be necessary for nighttime construction, which minimizes disruption to daytime traffic and business activities and for nighttime lighting for staging sites, primarily for security. However, nighttime construction activities would be limited to non-residential areas and nighttime illumination of staging areas would be directed towards the site and away from sensitive uses. Therefore, less-than-significant impacts are anticipated.

5.3.4.2 Indirect Impacts

No indirect adverse construction impacts associated with visual resources are anticipated under the At-Grade Emphasis LRT Alternative.

5.3.4.3 Cumulative Impacts

No cumulative adverse construction impacts associated with visual resources are anticipated under the At-Grade Emphasis LRT Alternative.

5.3.5 Air Quality

5.3.5.1 Direct Impacts

Regional Construction Emissions

An analysis of construction-related emissions was completed in accordance with SCAQMD requirements. The estimate included emissions from off-road construction equipment, fugitive dust, construction worker commuting, and haul truck emissions. Table 5-2 provides a summary of anticipated construction emissions during peak operation for the entire project area.

Use of electric construction equipment could be encouraged where feasible. Daily regional construction emissions are anticipated to exceed SCAQMD regional significance thresholds for VOC, NO_x, CO, and $PM_{2.5}$ and would result in a potential adverse effect without mitigation.

Localized Construction Emissions

In addition to evaluating emissions on a regional level, construction emissions were also compared to SCAQMD's localized significance thresholds. The methodology includes using look-up tables for NOx, CO, PM_{10}, and $PM_{2.5}$. The tables show the maximum allowable emission levels given the project location, acreage, and distance to the nearest receptor. It was assumed that most project construction sites would be approximately one acre in size and located within 25 meters of a receptor. The maximum localized construction emissions would occur during cut and cover construction along Flower Street, and would result in maximum daily localized emissions of approximately 300 pounds per day (ppd) of NO_x, 150 ppd of CO, 14 ppd of $PM_{2.5}$ and 15 ppd of PM_{10}. Daily construction emissions are anticipated to exceed SCAQMD localized significance thresholds for NO_x, PM_{10}, and $PM_{2.5}$, and would result in a potentially adverse localized air quality effect.

Table 5-2. At Grade Emphasis LRT Alternative (2014-2017) Maximum Daily Construction Emissions

Daily Emissions (pounds/day)						
Location	VOC	NOx	CO	SO_2	PM_{10}	$PM_{2.5}$
Onsite	281	2,088	1,088	2	82	75
Offsite	8	87	62	<1	21	6
Total	**289**	**2,175**	**1,150**	2	102	**80**
Threshold	75	100	550	150	150	55
Significant	Yes	Yes	Yes	No	No	Yes

*Note: Emissions greater than threshold of significance are shown in **bold**.*
Source: CDM, Metro Regional Connector Air Quality Technical Memorandum, 2010

5.3.5.2 Indirect Impacts

The At-Grade Emphasis LRT Alternative would result in indirect emissions of TACs from construction. A TAC is an air pollutant that can cause or contribute to an increase in mortality or in serious illness, or may pose another potential hazard to human health. Common TACs associated with mobile sources, such as passenger vehicles and construction equipment, include toluene, xylenes, acrolein, and DPM, among others. A Tier 1 risk assessment was included, which compares TAC emission levels to published screening limits. Only acute risks were reviewed because of the temporary nature of these potential impacts. Speciation profiles from CARB were used to estimate emissions of TACs from construction. The profiles for diesel vehicle exhaust (profile no. 425) and construction dust (profile no. 420) were used in the analysis. A summary of project-related emissions and Health Risk Assessment (HRA) results are provided in Table 5-3. Since volatile organic compound (VOC) emissions will decrease in future years because of improvements in engine technology, the HRA was not completed for VOC emissions. Instead, it was restricted to inorganic emissions. The At-Grade Emphasis LRT Alternative would not result in an adverse effect due to TAC construction emissions.

5.3.5.3 Cumulative Impacts

Daily regional and localized construction emissions are anticipated to exceed SCAQMD regional significance thresholds and would result in a potentially adverse cumulative effect without mitigation.

Table 5-3. At-Grade Emphasis LRT Alternative (2014-2017) Construction Health Risk Assessment				
TAC	**CAS #**	**Emissions (lb/hr)**	**PSL (lb/hr)**	**PSI**
Arsenic	7440-38-2	1.74E-05	1.00E-04	1.74E-01
Chlorine	7782-50-5	1.27E-03	1.05E-01	1.21E-02
Copper	7440-50-8	8.76E-05	5.00E-02	1.75E-03
Mercury	7439-97-6	1.01E-04	9.00E-04	1.12E-01
Nickel	7440-02-0	6.58E-05	3.00E-03	2.19E-02
			Application Screening Index (Total PSI)	3.22E-01
			Threshold	1

Notes:
TAC = Toxic Air contaminant
CAS = Chemical Abstracts Service
PSL = pollutant screening level (minimum level expected to exceed health risk)
PSI = pollutant screening index (PSL divided by project emissions)
ASI = application screening index (total PSI)
lb/hr = pounds per hour
Source: CDM, Metro Regional Connector Air Quality Technical Memorandum, 2010

5.3.6 Noise and Vibration

5.3.6.1 Direct Impacts

Anticipated construction activities, equipment, and related noise levels are shown in Table 5-4. Construction of the At-Grade Emphasis LRT Alternative would potentially generate noise and vibration from excavators, bulldozers, trenchers, drill rigs, cranes, and heavy-duty trucks used to transport construction equipment. According to the City of Los Angeles *2006 CEQA Thresholds Guide*, this type of construction activity would generate a maximum noise level of 90 dBA at 50 feet. The construction activities and locations with the greatest potential for noise impacts are: the Flower Street cut and cover tunnel, Flower/6th/5th Street station cut and cover construction, 2nd/Hope Street station open cut construction, and construction of the junction and underpass at Temple and Alameda Streets. These four activities have the greatest potential for noise impacts due to the extended duration of work and proximity to noise-sensitive land uses. Potential adverse effects from construction noise are anticipated if mitigation measures are not implemented.

Table 5-4. Construction Activity and Equipment Typical Noise Levels in dBA at 50 feet from Source for the At-Grade Emphasis LRT Alternative

Activity	Duration (months)	Construction Equipment				
		Concrete Truck	Dozer	Excavator	Crane	Drill Rig
Pre-Construction	4-6	NA	NA	NA	NA	90
Site Preparation	6-12	77	85	82	NA	NA
Flower Street Cut and cover Tunnel	24-48	77	85	82	81	90

Operating Systems Installation	TBD	TBD	TBD	TBD	TBD	TBD

Source: CDM, Metro Regional Connector Noise and Vibration Technical Memorandum, 2010.

The potential for GBV to cause damage to buildings varies based on type of building, building materials, structural techniques, and distance from construction activities. Thresholds are described in the Noise and Vibration Impacts Technical Memorandum, Tables 3-4 and 3-5. Pre-auguring would likely be necessary for installation of the soldier piles. During pre-augering, the holes for the piles would first be drilled and then the piles would be cast in place. Using the minimum safe distance for Category IV (0.12 inch/sec PPV), the potential worst case vibration category, vibration from construction equipment during construction of the At-Grade Emphasis LRT Alternative would result in an adverse effect if it occurred less than 21 feet from buildings. A pre-construction survey of structures within 21 feet of the anticipated construction zone would be conducted to assess potential for GBV to cause

damage, and to establish baseline pre-construction conditions. Because impact type construction equipment such as pile drivers and hoe rams would not be used, no construction vibration impacts related to impact type equipment are anticipated.

Vibration from large bulldozers and drill rigs could exceed the FTA annoyance criteria for sensitive receptors identified in the Noise and Vibration Technical Memorandum, Table 3-2. However, perceptible vibration from construction equipment would be short-term and intermittent. Therefore, perceptible vibration from the construction equipment is considered an "infrequent event," less than 30 events a day as defined by FTA. Sensitive receptors located along the alignment are considered Category 2 and Category 3 land uses under the FTA annoyance criteria. Short-term vibration levels during construction could exceed the FTA annoyance criteria if the identified construction equipment operates within 20 feet of Category 2 land uses or within 16 feet of Category 3 land uses. After incorporating the adjustment of 10 dBA for coupling to building foundation loss (Table 10-1, FTA, 2006), occupants would not be subject to vibration levels above the FTA annoyance criteria. It should be noted that large bulldozers and drill rigs would operate intermittently and would not be used during every day of construction. Without the implementation of mitigation measures, potentially adverse effects from vibration could occur.

5.3.6.2 Indirect Impacts

Impacts from construction-related activities are temporary and direct in nature. No indirect impacts are anticipated from noise or vibration under the At-Grade Emphasis LRT Alternative.

5.3.6.3 Cumulative Impacts

Impacts from noise and vibration during construction would be short term and would not contribute to a cumulative adverse effect. Therefore, no cumulative adverse noise or vibration impacts are anticipated under the At-Grade Emphasis LRT Alternative.

5.3.7 Geotechnical/Subsurface/Seismic/Hazardous Materials

5.3.7.1 Direct Impacts

Geotechnical/Subsurface/Seismic

The At-Grade Emphasis LRT Alternative proposed alignment does not cross any known faults. However, portions of the proposed alignment occur in areas mapped with the potential for liquefaction based on soil stability. Areas susceptible to liquefaction are along Flower Street between Wilshire Boulevard and 2nd Street, and along 2nd Street between Hill and San Pedro Streets. The eastern edge of the alignment near the intersection of 1st and Temple Streets is within the mapped Inundation Hazard Area. In addition, the proposed 2nd/Hope Street Station is within the Hillside Ordinance area (Bunker Hill).

During construction of underground stations, portal structures, and the Alameda Street underpass, there is the potential for adverse impacts related to ground settlement and

differential settlement on adjacent structures including historical buildings. Further evaluation and survey would be performed during final design to establish building types and existing conditions, and to develop criteria to limit potential movement to acceptable threshold values. Protection of buildings could involve design of adequately rigid excavation support systems, underpinnings, and ground improvements to minimize settlement to tolerable limits. A preconstruction survey of the adjacent structures and all historical buildings in the vicinity would be conducted to establish a baseline for measuring potential construction-induced damage. Construction monitoring would be required to ensure that ground movement does not exceed threshold values. With mitigation, less-than-significant impacts are anticipated.

Construction of surface track work, stations, and portals would likely require removal of protective vegetation or pavement that would increase the potential for soil erosion. With mitigation, potential adverse construction impacts associated with subsurface soils would be less than significant.

Hazardous Materials

Construction of the At-Grade Emphasis LRT Alternative would entail excavation along most of the proposed alignment, during which contaminated soil and groundwater could be encountered. As listed in Table 4-5 of the Geotechnical/Subsurface/Seismic/Hazardous Materials Technical Memorandum, known and suspected soil and groundwater contamination exists at properties along the proposed alignment for the At-Grade Emphasis LRT Alternative. Lead may be present in surface soils from historical vehicle emissions of older automobiles using leaded gasoline, and PCBs may exist in surface or subsurface soils from leaking transformers. If released during excavation, there is potential for these hazardous materials to impact human health and the environment. Until further study is conducted, the actual levels of hazardous materials that could be encountered in soil and groundwater during construction are unknown. Without mitigation, potential adverse impacts are anticipated.

5.3.7.2 Indirect Impacts

No indirect adverse construction geotechnical, subsurface, seismic, or hazardous materials impacts are anticipated under the At-Grade Emphasis LRT Alternative.

5.3.7.3 Cumulative Impacts

No cumulative adverse construction geotechnical, subsurface, seismic, or hazardous materials impacts are anticipated under the At-Grade Emphasis LRT Alternative.

5.3.8 Water Quality

5.3.8.1 Direct Impacts

According to the Geotechnical/Subsurface/Seismic/ Hazardous Materials Technical Memorandum and the Water Resources Technical Memorandum, there is known and suspected soil and groundwater contamination along the proposed alignment. Construction activities have the potential to increase erosion and sedimentation around proposed construction and staging areas. Grading activities associated with construction could potentially result in a temporary increase in the amount of suspended solids running off construction sites. In the case of a storm event, construction site runoff could result in sheet erosion of exposed soil. Groundwater may be encountered during trenching or tunneling, and would require dewatering. Dewatering activity would result in the potential release of contaminated water due to the presence of relatively shallow groundwater (located at depths ranging from 14 to 36 feet) that is contaminated with pollutants common to urban development. All dewatering activity would occur with a NDPES permit. Testing would occur prior to construction and on-site treatment and discharge in accordance with applicable standards or transport to a treatment or disposal facility would be required. Without mitigation, potential adverse construction impacts associated with water quality are anticipated under the At-Grade Emphasis LRT Alternative.

5.3.8.2 Indirect Impacts

No indirect adverse construction impacts associated with water quality are anticipated under the At-Grade Emphasis LRT Alternative.

5.3.8.3 Cumulative Impacts

No cumulative adverse construction impacts associated with water quality are anticipated under the At-Grade Emphasis LRT Alternative.

5.3.9 Energy

5.3.9.1 Direct Impacts

The highest direct energy consumption would occur during site clearance and construction guideways, stations, and support facilities. . Construction of the At-Grade Emphasis LRT Alternative would result in the one-time, non-recoverable energy cost of of 3,457 billion British Thermal Units (BTUs). This impact would be temporary, and the project would result in long-term, beneficial decreases in energy use in the region. LADWP is committed to increasing electricity generation from renewable energy sources and ensuring a reliable flow of electricity to users in its service area. Given the long-term, beneficial decreases in energy use associated with this alternative, potential construction-related impacts would be less-than significant.

5.3.9.2 Indirect Impacts

No indirect adverse construction impacts associated with energy are anticipated under the At-Grade Emphasis LRT Alternative.

5.3.9.3 Cumulative Impacts

No cumulative adverse construction impacts associated with energy are anticipated under the At-Grade Emphasis LRT Alternative.

5.3.10 Climate Change

5.3.10.1 Direct Impacts

No direct adverse construction impacts associated with climate change are anticipated under the At-Grade Emphasis LRT Alternative.

5.3.10.2 Indirect Impacts

No indirect adverse construction impacts associated with climate change are anticipated under the At-Grade Emphasis LRT Alternative.

5.3.10.3 Cumulative Impacts

The construction of the At-Grade Emphasis LRT Alternative would result in Greenhouse Gas (GHG) emissions from diesel-fueled construction equipment. Construction emissions would result from the use of onsite equipment, offsite worker vehicles, and offsite haul trucks. A total of approximately 76,400 metric tons per year of GHG emissions would be produced during all phases of construction under the At-Grade Emphasis LRT Alternative.

The At-Grade Emphasis LRT Alternative would result in a decrease in GHG emissions compared to the No Build Alternative and, because of regional growth unrelated to the project, an increase in GHG emissions compared to existing conditions (2009). The At-Grade Emphasis LRT Alternative is consistent with CARB's Scoping Plan requirement to reduce GHG emissions. It is expected that other projects operating in 2035 would be consistent with the emission reduction targets of SB 375 and the Regional Transportation Plan. As a result, emissions would not be cumulatively significant.

5.3.11 Historic, Archaeological, and Paleontological Resources

5.3.11.1 Direct Impacts

Historic Resources

Potential effects, but no adverse effects, would result from dirt from construction activities, changes in access during construction, visual changes during construction, demolition and partial takes, construction of at-grade stations, installation of catenary poles and TPSS. The effects would be short-term and would not alter characteristics of historic properties in a

manner that would diminish the integrity of the properties' location, design, setting, materials, workmanship, feeling, or association.

In applying the criteria of adverse effect for historic properties (36 CFR 800.5(a)(1)) potentially affected by the construction near 2nd Street, an adverse effect would occur due to the demolition of a portion of the NRHP eligible 2nd Street Tunnel and the subsequent change in use. The changes would directly alter a characteristic of the historic property in a manner that would diminish the integrity of the property's location, design, setting, materials, workmanship, feeling, or association. Documentation of the property in accordance with mitigation measure MM-BE-1 would resolve the potential adverse effect.

At least seven NRHP and/or CRHR eligible properties could be potentially affected by cut and cover construction, differential settlement, and construction noise and vibration associated with construction of the At-Grade Emphasis LRT Alternative. The implementation of design measures would protect and stabilize the ground near historic properties as noted in MM-BE-2, MM-BE-3, and MM-BE-5. These measures would avoid adverse effects to all properties. If properly implemented, short term construction activities would not directly alter a characteristic of the historic property in a manner that would diminish the integrity of the property's location, design, setting, materials, workmanship, feeling, or association.

Archaeological Resources

The At-Grade Emphasis LRT Alternative has the potential to alter, remove, or destroy archaeological resources within the APE. Site RC-1, a historic brick alignment, may be affected during ground disturbance from construction of a proposed pedestrian bridge at the intersection of Temple and Alameda Streets.
Site RC-1 appears to be not eligible for National Register or California Register listing. However, previously unrecorded parts of the site that retain substantial integrity may be present. This alternative also has the potential to affect previously unrecorded archaeological resources during ground disturbance from constructing new underground tunnel segments on Flower Street between 7th Street and Hope Street; new stations proposed at Main/1st Streets, Los Angeles/1st Streets, 2nd/Hope Streets, and Flower/6th/5th Streets; and an automobile underpass and pedestrian overpass on Alameda Street at Temple Street. Such damage to archaeological resources would represent a significant effect that could be mitigated. Implementing MM-A-1 (see Section 6.1) would reduce this effect to a less-than-significant level.

Paleontological Resources

The At-Grade Emphasis LRT Alternative has the potential to adversely impact paleontological resources at the surface and at depth within the project area as a result of ground disturbance related to construction of new underground tunnel segments between 7th and Hope Streets and at new proposed stations at Flower/6th/5th Street, 2nd/Hope Street, Main/1st Street, and Los

Angeles/1st Street. Any ground disturbances in areas of high sensitivity (See Figure 4-3) will have the potential to impact paleontological resources at the surface and at depth; area ground disturbance in areas of sensitivity ranging from low to high have the potential to impact paleontological resources at a depth of 5 feet or greater below the ground surface. In areas where proper mitigation measures (Section 6.1) can be implemented, potential impacts can be reduced to a less than significant level.

5.3.11.2 Indirect Impacts

The construction of the At-Grade Emphasis LRT Alternative would have the potential to indirectly impact historical resources during cut and cover construction, underpass construction at Alameda and Temple Streets, and during construction of the new portals into the 2nd Street tunnel. The potential impacts would be indirect because the construction activities themselves would not damage historical properties, but vibration and possible subsidence of soils could potentially impact the historical integrity of buildings. Mitigation would minimize the potential adverse impacts.

5.3.11.3 Cumulative Impacts

No cumulative adverse construction impacts associated with historical, archaeological, or paleontological resources are anticipated under the At-Grade Emphasis LRT Alternative.

5.3.12 Ecosystems and Biological Resources

5.3.12.1 Direct Impacts

During construction of the At-Grade Emphasis LRT Alternative, some mature trees located along the proposed alignment could be removed. As these mature trees may provide potential nesting and roosting habitat for bird species, including raptors, removal or disturbance of this vegetation during the nesting season could directly impact this habitat and any bird species that are present. There are currently approximately 250 mature trees in the area that could potentially be affected by construction, and some of these trees could be removed or disturbed. Approximately 60 of the trees are native California sycamore trees, a protected species. Potential mitigation measures are described in Section 6 and include compliance with the Native Tree Protection Ordinance. Compliance with the Native Tree Protection Ordinance, including replacement of this protected species at a 2:1 ratio, would reduce this potential impact to a less than significant level.

5.3.12.2 Indirect Impacts

Direct impacts to birds and their habitat by removing or disturbing mature trees have the potential to cause indirect impacts elsewhere. If birds are forced to relocate to new areas during the nesting season, increased competition for food and nesting habitat would be a potential indirect impact.

However, because the downtown area provides only low quality habitat for migratory birds, these potential impacts are not considered to be significant because only a small number of birds (if any) could be displaced. Further, mitigation taken to comply with the Migratory Bird Treaty Act (MBTA) and the California Fish and Game Code would reduce potential indirect impacts to a less-than-significant level.

5.3.12.3 Cumulative Impacts

No cumulative adverse construction impacts associated with ecosystems or biological resources are anticipated under the At-Grade Emphasis LRT Alternative.

5.3.13 Parklands and Other Community Facilities

5.3.13.1 Direct Impacts

During construction of the At-Grade Emphasis LRT Alternative, access to the parking structure beneath Maguire Gardens and pedestrian access to the gardens and the City Hall Park could potentially be reduced, but not eliminated, due to street closures and construction activities. Discrete locations along the alignment that could experience modified pedestrian and vehicle access during construction and operation include the new Los Angeles Police Department (LAPD) headquarters, the State of California Department of Transportation (Caltrans) building, City Hall, City Hall East, the U.S. Federal Government Building (Roybal Center), the Los Angeles Ambulatory Care Center, the fire station on Temple Street, and the Little Tokyo Branch Public Library. Disruption of traffic patterns would restrict access to certain community resources such as the MOCA, JANM, and the Go for Broke Monument. This would have the potential to affect annual festivals and events held in the downtown area during the construction period. Response times for emergency services could also be impacted due to street closures and detours. Without mitigation, potential adverse construction impacts associated with parklands and other community facilities are anticipated under the At-Grade Emphasis LRT Alternative.

5.3.13.2 Indirect Impacts

Although construction impacts are direct by nature, the construction of the At-Grade Emphasis LRT Alternative alignment could potentially discourage patrons of community facilities and parks to visit them due to restricted access and temporary parking restrictions. Without mitigation, potential adverse impacts are anticipated.

5.3.13.3 Cumulative Impacts

No cumulative adverse construction impacts associated with parklands or other community facilities are anticipated under the At-Grade Emphasis LRT Alternative.

5.3.14 Economic Vitality and Employment Opportunities

5.3.14.1 Direct Impacts

Construction of the At-Grade Emphasis LRT Alternative would directly impact several businesses located along the alignment due to lane closures, sidewalk detours and restricted street parking during track installation and cut and cover activities. These businesses, including Pitfire Pizza, China Bistro, and the Kawada Hotel among others, primarily rely on vehicular and pedestrian traffic for revenue generation. The Economic and Fiscal Impacts Technical Memorandum provides a list of businesses along the proposed alignment that would likely be affected by the track installation and street closures during construction. In addition, temporary closures or restricted access to Alameda Street during construction of the underpass and pedestrian bridge would impact a heavily utilized truck route and restrict freeway access to Little Tokyo. Cultural institutions, such as MOCA and JANM, could potentially be impacted directly and other businesses indirectly. Investment in transportation, including direct investment in the form of capital construction and operation costs, provides economic benefits in several basic ways: the creation of direct and indirect jobs, and spending by suppliers whose goods and services are used in the project. These benefits are discussed in the Economic and Fiscal Impacts Technical Memorandum. The benefits of the additional transit infrastructure in the long-term would outweigh the temporary significant impacts in the project area.

5.3.14.2 Indirect Impacts

No indirect adverse construction impacts associated with economic vitality are anticipated under the At-Grade Emphasis LRT Alternative.

5.3.14.3 Cumulative Impacts

No cumulative adverse construction impacts associated with economic vitality are anticipated under the At-Grade Emphasis LRT Alternative.

5.3.15 Safety and Security

5.3.15.1 Direct Impacts

The contractor will have a safety plan and be responsible for construction site security in conformance with local regulations and standards. Construction activities are not anticipated to affect security in the project area. Typically construction areas are fenced off with restricted access and are well lit. No direct adverse impacts associated with safety or security are anticipated.

5.3.15.2 Indirect Impacts

No indirect adverse construction impacts associated with safety or security are anticipated under the At-Grade Emphasis LRT Alternative.

5.3.15.3 Cumulative Impacts

No cumulative adverse construction impacts associated with safety or security are anticipated under the At-Grade Emphasis LRT Alternative.

5.4 Underground Emphasis LRT Alternative

The Underground Emphasis LRT Alternative would extend from the 7th Street/Metro Center Station north beneath Flower Street with a new underground station north of 5th Street. At 2nd Street, the underground tunnel would extend east with a new underground station near 2nd and Hope Streets to provide access to Bunker Hill. A pedestrian bridge could potentially be constructed to connect the 2nd/Hope Street station to Upper Grand Avenue. A second underground station would be located either between Broadway and Spring Street or between Main and Los Angeles Streets. The tunnel would emerge to at-grade connections just southwest of the intersection of 1st and Alameda Streets. At 1st and Alameda Streets, a new underpass would carry car and truck traffic along Alameda Street below the rail junction, and a new overhead pedestrian bridge structure would eliminate most conflicts between pedestrians and trains. This alternative would have a single at-grade crossing at the intersection of 1st and Alameda Streets.

Construction of the Underground Emphasis LRT Alternative would consist of the activities listed in Table 5-5 and would require utility relocation, street closures, creation of staging areas necessary for equipment storage, creation of haul routes for construction equipment and excavated materials, laying of surface track work, cut and cover station excavation, portal construction, excavation or installation of foundations, and possible SEM station construction.

The analysis of the potential impacts that these construction activities could have are discussed for all environmental topic areas except for Land Use and Growth-Inducing Impacts because construction activities do not tend to have impacts in these topic areas.

5.4.1 Traffic and Parking

5.4.1.1 Direct Impacts

Permanent Impacts During Construction

Construction of the Underground Emphasis LRT Alternative would result in the permanent loss of approximately 20 on-street parking spaces. Three bus loading spaces in front of JANM on Alameda Street would be eliminated, but additional spaces are available on 1st Street, and replacement spaces would be identified in close proximity to the museum. The details of these project impacts and mitigation measures are presented in the Transportation Technical Memorandum and the Displacements and Relocation of Existing Uses Technical Memorandum.

Construction-Related Impacts

Construction of the Underground Emphasis LRT Alternative would require the loss of on-street parking and reduction in travel lanes in certain locations. In most instances, these would be temporary conditions during the construction phase. In areas designated for cut and cover or SEM construction, the top two to three feet of the roadway would be removed, and decking would be installed over an approximate three- to four-month period. Construction of the stations would continue underneath while traffic operates normally on the decking. This procedure would require temporary off-peak, nighttime and weekend street closures to install the decking. The closure schedules would be coordinated to minimize impacts to residences, businesses, and traffic flow. As these street closure requirements are identified, traffic would be rerouted to adjacent streets with detours clearly signed and marked.

Utility relocations, track installation, station construction, and construction of the proposed Alameda Street underpass at 1st Street would require the temporary closure of lanes on Flower Street, Hope Street in the vicinity of General Thaddeus Kosciuszko Way, 2nd Street, 1st Street, and Alameda Street. This would result in a reduction of roadway capacity and potentially the modification of existing traffic patterns to bypass congested areas. Vehicular travel times and intersection operations along these roadways would potentially be impacted. The construction of the proposed Alameda Street underpass at 1st Street would also result in the reduction of roadway capacity for extended periods of time. In order to maintain two through travel lanes in each direction during construction activities, the two-way left turn median in the mid-block area and the exclusive right and left turn lanes at the intersection approaches would be temporarily eliminated over the two to three year period estimated to construct the underpass. The north-south intersection lane configurations would consist of a shared through and right turn lane and a shared through and left turn lane on Alameda Street between Aliso and 1st Streets. In addition, the existing signal phasing may be changed to split phasing in order to minimize conflicts between left turns and opposing through movements, and to minimize the formation of queues behind vehicles waiting for gaps in opposing traffic to complete left turn movements. Consequently, travel times along this segment of Alameda Street are expected to increase due to the potential for increased traffic congestion. Also, operating conditions for the Alameda Street intersections between Aliso and 1st Streets are expected to deteriorate.

Table 5-5. Construction Activity Summary for the Underground Emphasis LRT Alternative												
Activity	Duration (months)	Construction Equipment							Soil (CY)	Concrete (CY)	Truck Trips Per Day	Workers Per Day
		Haul Trucks	Concrete Truck	Dozer	Excavator	Crane	Drill Rig	Flatbed

Source: CDM, 2009.

Construction of the Underground Emphasis LRT Alternative would require the use of heavy-duty trucks to transport equipment and excavated soil. The addition of these trucks to the existing street network has the potential to adversely affect traffic and parking. The additional excavated soil necessary to construct the underground segment along 2nd Street would require more haul trucks than the At-Grade Emphasis LRT Alternative. Haul and delivery truck routes would affect residents and commuters along the proposed alignment. Tunnel spoil hauling, rail and catenary deliveries, and general construction traffic would impact traffic flow as well. Roadway surface restoration may be needed in areas that experience frequent project-related truck trips. These would be temporary conditions during the construction phase.

Lane closures during construction on Flower Street, Hope Street in the vicinity of General Thaddeus Kosciuszko Way, Main Street, 2nd Street, 1st Street, and Alameda Street would result in the temporary removal of existing on-street parking spaces and loading stalls. This would impact parking spaces and loading areas on the both sides of Flower Street, on 2nd Street between Spring and Alameda Streets, on Central Avenue and Alameda Street between 1st and 2nd Streets, and on 1st Street between San Pedro and Hewitt Streets. In addition, the realigned intersection of Hope Street in the vicinity of General Thaddeus Kosciuszko Way may temporarily remove several parking spaces along both the east and west sides of the roadway segment. In the vicinity of the Alameda Street underpass, the JANM tour bus loading zone on the west side of the street would be temporarily removed and relocated for the duration of the construction period.

Cut and cover station construction along segments of Flower Street and construction of the underpass on Alameda Street may require temporary sidewalk detours, which could potentially impede pedestrian flow. However, pedestrian flow on 2nd Street would be better under this alternative than the At-Grade Emphasis LRT Alternative. In addition, the construction of the underpass on Alameda Street may result in localized shifts in traffic to adjacent streets such as Central Avenue, which is designated as a Class III bicycle route. The flow of bicycle traffic could potentially be impacted due to increased traffic volumes on Central Avenue. The additional automobile traffic would result in increased turning movements, potentially reducing bicycle operating speeds or resulting in a greater risk of bicycle-automobile conflict, since Class III routes do not have bicycle-designated lanes.

Restoration of the curb parking spaces, pedestrian facilities, bicycle lanes, and auto lanes to their permanent configuration would occur prior to operations. Potential short term, adverse impacts are anticipated during construction of this alternative.

5.4.2.1 Indirect Impacts

Impacts from construction-related activities are temporary and direct in nature. No indirect impacts to traffic circulation or parking are anticipated under the Underground Emphasis LRT Alternative.

5.4.2.2 Cumulative Impacts

Impacts to traffic circulation during construction would be short term. However, they would contribute to a potential cumulative adverse effect when combined with other projects in the downtown area. Therefore, potential cumulative adverse traffic circulation impacts are anticipated under the Underground Emphasis LRT Alternative.

5.4.2 Displacements and Relocation

5.4.2.1 Direct Impacts

Permanent Impacts During Construction Period

To construct the Underground Emphasis LRT Alternative, 11 full takes, ten partial takes, and four permanent underground easements would be required at different locations along the alignment. These properties would be utilized for TPSS facilities, construction staging, below grade tunneling, and station construction. The details of these impacts and mitigation measures are presented in the Displacements and Relocation of Existing Uses Technical Memorandum.

Construction-Related Impacts

During construction of the Underground Emphasis LRT Alternative, creation of staging areas would require temporary easements that would impact eight parcels. The portions of these parcels that would be utilized would be plazas and open areas. Access to businesses, existing buildings, and sidewalks would be maintained, though detour routes may be required. Mitigation would minimize the adverse impacts associated with this type of displacement during construction. Once construction is completed, the sites would be restored to their permanent conditions.

5.4.2.2 Indirect Impacts

Displacement impacts are direct in nature. Therefore, no indirect construction impacts associated with displacement are anticipated.

5.4.2.3 Cumulative Impacts

No cumulative adverse construction impacts associated with displacements or relocation are anticipated under the Underground Emphasis LRT Alternative.

5.4.3 Community and Neighborhoods

5.4.3.1 Direct Impacts

Mobility would be reduced in the Financial District, Bunker Hill, Civic Center, the Historic Core, and Little Tokyo areas due to street closures associated with construction activities including track installation at 1st and Alameda, cut and cover excavation, and structural support work. Disruption of traffic patterns would restrict, but not eliminate, access to

residences and businesses. In Little Tokyo, disruption to traffic along Alameda and 1st Streets would directly affect cultural institutions such as JANM, the Go for Broke Monument, MOCA, and other businesses during the excavation and construction of the Alameda Street underpass and the potential pedestrian bridge. In addition, the installation of TBMs either in the Little Tokyo or Bunker Hill areas would temporarily disrupt communities, businesses, and residents. Buildings likely to experience disruption include Savoy and Honda Plaza in Little Tokyo, and the Bunker Hill Towers. Without mitigation, potential adverse construction impacts associated with community and neighborhoods are anticipated under the Underground Emphasis LRT Alternative.

5.4.3.2 Indirect Impacts

During utility relocation, mobility would be temporarily reduced in the Financial District, Bunker Hill, Civic Center, Historic Core, and Little Tokyo areas. Disruption of traffic patterns would temporarily restrict access to residences and businesses. This could impact the economic vitality of some businesses, particularly in Little Tokyo, where the community has expressed concern about construction activities. Prolonged disruption to businesses could affect community cohesion. Without mitigation, potential adverse indirect construction impacts associated with community and neighborhoods are anticipated under the Underground Emphasis LRT Alternative.

5.4.3.3 Cumulative Impacts

No cumulative adverse construction impacts associated with communities or neighborhoods are anticipated under the Underground Emphasis LRT Alternative.

5.4.4 Visual Resources and Aesthetics

5.4.4.1 Direct Impacts

Views and Visual Character

During construction of the Underground Emphasis LRT Alternative, several construction staging areas would be utilized. These staging areas and the areas where the TBMs will be deployed, either in Little Tokyo or Bunker Hill, would be separated from non-construction areas by barriers. The placement of concrete barriers with fencing would be visible from multi-family residences and other sensitive uses adjacent to the alignment, particularly the Bunker Hill Towers, Hikari, and Savoy. Viewers would see construction equipment, construction-related activities, and stockpiles of dirt and debris, and the urban streetscape would be temporarily altered. Screening of construction staging areas would minimize aesthetic impacts at street level. The project would be constructed in a heavily urbanized environment where construction activities are not uncommon, and the construction of the project would not noticeably reduce visual quality or alter viewing context. Visual character impacts would be limited to construction staging areas and would occur to a lesser extent than under the At-Grade Emphasis LRT Alternative. In Little Tokyo, large construction

equipment would be required for the excavation and construction of the Alameda Street underpass and the potential pedestrian bridge. These impacts would be temporary and less than significant. Overall, less-than-significant impacts associated with views and visual character are anticipated.

Lighting

Temporary lighting may be necessary for nighttime construction, which is sometimes scheduled in order to minimize disruption to daytime traffic and for nighttime lighting for staging sites, primarily for security. However, nighttime construction activities would be limited to non-residential areas and nighttime illumination of staging areas would be directed towards the site and away from sensitive uses. Therefore, less-than-significant impacts are anticipated.

5.4.4.2 Indirect Impacts

No indirect adverse construction impacts associated with visual resources are anticipated under the Underground Emphasis LRT Alternative.

5.4.4.3 Cumulative Impacts

No cumulative adverse construction impacts associated with visual resources are anticipated under the Underground Emphasis LRT Alternative.

5.4.5 Air Quality

5.4.5.1 Direct Impacts

Regional Construction Emissions

An analysis of anticipated construction-related emissions was completed in accordance with SCAQMD requirements. The estimate included emissions from off-road construction equipment, fugitive dust, construction worker commuting, and haul trucks. Table 5-6 provides a summary of anticipated construction emissions during peak operation for the entire project area.

Daily regional construction emissions are anticipated to exceed SCAQMD regional significance thresholds for VOC, NO_x, CO, and $PM_{2.5}$, and would result in a potential adverse effect without mitigation. Regional construction emissions would be highest during cut and cover or SEM construction activity. The additional excavated soil for the underground segment along 2nd Street would result in an increase in haul truck trips and construction intensity compared to the At-Grade Emphasis LRT Alternative.

Table 5-6. Underground Emphasis LRT Alternative (2014-2017) Maximum Daily Regional Construction Emissions

Daily Emissions (pounds/day)						
Location	VOC	NOx	CO	SO_2	PM_{10}	$PM_{2.5}$
2nd/Hope Street station (SEM) + Broadway Station Option						
Onsite	**300**	**2,247**	**1,189**	4	82	**75**
Offsite	8	89	59	<1	19	6
Total	**308**	**2,336**	**1,249**	4	101	**80**
2nd/Hope Street station (Open Cut) + Broadway Station Option						
Onsite	**304**	**2,280**	**1,210**	4	83	**75**
Offsite	9	94	62	11<1	20	6
Total	**313**	**2,375**	**1,272**	4	103	**81**
2nd/Hope Streets station (SEM) + Los Angeles Street Station Option						
Onsite	**300**	**2,247**	**1,189**	4	82	**75**
Offsite	8	85	58	<1	19	5
Total	**308**	**2,332**	**,1,247**	4	101	**80**
2nd/Hope Street station (Open Cut) + Los Angeles Street Station Option						
Onsite	**304**	**2,280**	**1,210**	4	83	**75**
Offsite	8	91	61	<1	19	6
Total	**313**	**2,371**	**1,270**	4	103	**81**
Threshold	75	100	550	150	150	55

*Note: Significant emissions are shown in **bold**.*
Source: CDM, Metro Regional Connector Air Quality Technical Memorandum, 2010.

Localized Construction Emissions

In addition to evaluating emissions on a regional level, construction emissions were also compared to SCAQMD's localized significance thresholds. The maximum localized construction emissions would occur during cut and cover construction of the tunnel on Flower Street, the Flower/6th/5th Street station, the 2nd Street station - Broadway Option or the 2nd Street station - Los Angeles Street Option, and would result in maximum daily localized emissions of approximately 300 ppd of NO_X, 170 ppd of CO, 10 ppd of $PM_{2.5}$ and 11 ppd of PM_{10}. The additional soil removal necessary for the underground segment along 2nd Street would also intensify the localized emissions compared to the At-Grade Emphasis LRT Alternative. Use of electric construction equipment could be encouraged where feasible. Daily construction emissions are anticipated to exceed SCAQMD localized significance thresholds for NO_X, and PM_{10}, and $PM_{2.5}$, and would result in a potential adverse localized air quality construction effect.

5.4.5.2 Indirect Impacts

The Underground Emphasis LRT Alternative construction activities would result in indirect emissions of TACs. Emissions from the project were compared to existing conditions (2009) for CEQA. A summary of project-related emissions are provided in Table 5-7. A summary of the results of the Tier 1 HRA are provided in Table 5-8. Since VOC emissions will decrease in future years because of the improvement in engine technology, the HRA was not conducted for VOC emissions. Instead, it was restricted to inorganic emissions. The Underground Emphasis LRT Alternative would not cause significant construction emissions of TACs under CEQA.

5.4.5.3 Cumulative Impacts

Daily regional and localized construction emissions are anticipated to exceed SCAQMD regional significance thresholds and would result in a potential adverse cumulative effect without mitigation.

5.4.6 Noise and Vibration

5.4.6.1 Direct Impacts

Anticipated construction activities, the construction equipment expected to be used, and the related noise levels are shown in Table 5-9.

Construction of the Underground Emphasis LRT Alternative would generate noise and vibration from excavators, bulldozers, trenchers, drill rigs, tunnel boring machines, cranes, and heavy-duty trucks used to transport construction equipment. According to the City of Los Angeles *2006 CEQA Thresholds Guide*, this type of construction activity would generate a maximum noise level of 90 dBA at 50 feet. The construction activities with the greatest potential to cause noise impacts are: cut and cover excavation on Flower Street, cut and cover construction of the Flower/5th/4th Street station, construction of the cut and cover approach to the 2nd/Hope Street station, construction of the 2nd/Hope Street station, construction of the 2nd

Street station - Broadway Station Option or the 2nd Street Station - Los Angeles Street Option, and construction of the1st and Alameda junction and underpass. These activities would have the greatest potential for noise impacts due to the duration of construction work and proximity to noise sensitive land uses. Without mitigation, adverse effects from construction noise are anticipated.

Table 5-7. Underground Emphasis LRT Alternative (2014-2017) TAC Construction Emissions

TAC	CAS #	Emissions (pounds/hr)			
		2nd/Hope SEM + Broadway Option	2nd/Hope Open Cut + Broadway Option	2nd/Hope SEM + Los Angeles Street Option	2nd/Hope Open Cut + Los Angeles Street Option
Arsenic	7440-38-2	1.83E-05	1.86E-05	1.83E-05	1.86E-05
Chlorine	7782-50-5	1.41E-03	1.46E-03	1.40E-03	1.45E-03
Copper	7440-50-8	9.26E-05	9.44E-05	9.23E-05	9.42E-05

Nickel	7440-02-0	6.86E-05	6.98E-05	6.85E-05	6.97E-05

Notes:
ASI = application screening index (total PSI)
CAS = Chemical Abstracts Service
lb/hr = pounds per hour
PSI = pollutant screening index (PSL divided by project emissions)
PSL = pollutant screening level (minimum level expected to exceed health risk)
TAC = toxic air contaminant
Source: CDM, Metro Regional Connector Air Quality Technical Memorandum, 2010.

Noise levels for TBM operation are not listed, except for the potential installation and recovery sites, because TBM operation occurs underground and produces little to no noise at the surface. The operations at the potential installation and recovery sites account for the noise listed in Table 5-9. These would be the potential locations where excavated material would be treated and removed. Other construction noise along the TBM segment would be produced haul trucks and equipment needed to perform utility relocations. Noise from these sources

would generate a maximum of 85 dBA at 50 feet and would occur less frequently and for a shorter duration than construction of the At-Grade Emphasis LRT Alternative along 2nd Street.

Table 5-8. Underground Emphasis LRT Alternative (2014-2017) Construction Health Risk Assessment

Using the minimum safe distance for Category IV (0.12 inch/sec PPV), the potential worst case vibration category, vibration from construction equipment during utility relocation lane closures would result in a potential adverse effect if it occurred less than 21 feet from buildings. A pre-construction survey of structures within 21 feet of the anticipated zone of construction would be conducted to assess the potential for GBV to cause damage, and to establish baseline pre-construction conditions.

Table 5-9. Construction Activity and Equipment Typical Noise Levels in dBA at 50 feet from Source for the Underground Emphasis LRT Alternative

Activity	Duration (months)	Construction Equipment				
		Concrete Truck	Dozer	Excavator	Crane	Drill Rig

Source: CDM, 2010

For the Underground Emphasis LRT Alternative, pre-auguring of the soldier piles at the cut and cover sections would eliminate the need for impact pile driving. Large bulldozers and drill rigs would be the main construction vibration sources, but would operate intermittently and would not be used during every day of construction. LRT construction could begin simultaneously at several locations along the selected route in order to minimize overall construction time. Construction activities in any one location would not last for the entire project construction period.

TBMs perform a slow moving drilling process that produces very little vibration in the surrounding areas. PPVs from tunnel construction in soft ground ranges from 0.0024 to 0.0394 inches per second at a distance of 33 feet from the vibration source. Similar vibration velocities at the same 33 feet distance in the range of 0.0157 to 0.0551 inches per second have also been measured. These PPV vibrations may also be expressed as root mean square (rms) vibration velocity levels ranging from 56 to 83 decibels (VdB) at 33 feet using the same conversion calculation as FTA. The range of vibration generated by TBMs (between 0.0024 to 0.0551 inches per second PPV at a distance of 33 feet) and the distance below grade that tunnel boring would occur (a minimum of 30 feet below ground surface), would yield vibration levels well below the FTA threshold for Category IV buildings of 0.12 inches per second PPV.

TBMs, large bulldozers, and drill rigs would be the main construction vibration sources that could potentially exceed the FTA annoyance criteria for sensitive receptors, as shown in The Noise and Vibration Technical Memorandum, Table 3-2. Perceptible vibration from the construction equipment would be short-term and intermittent, and considered an "infrequent event," less than 30 events per day, as defined by FTA. Sensitive receptors located along the alignment are considered Category 2 and Category 3 land uses under the FTA annoyance criteria. Short-term vibration levels during construction could exceed the FTA annoyance criteria if the identified construction equipment operates within 20 feet of Category 2 land uses or within 16 feet of Category 3 land uses. After incorporating the adjustment of -10 dBA for coupling to building foundation loss (Table 10-1, FTA, 2006), building occupants would not be subject to vibration levels above the FTA annoyance criteria. It should be noted that large bulldozers and drill rigs would operate intermittently and would not be used during every day of construction. Without the implementation of mitigation measures, vibration impacts would be potentially significant.

5.4.6.2 Indirect Impacts

Impacts from construction-related activities are temporary and direct in nature. No indirect impacts are anticipated from noise or vibration under the Underground Emphasis LRT Alternative.

5.4.6.3 Cumulative Impacts

Impacts from noise and vibration during construction would be short term and would not contribute to a cumulative adverse effect. Therefore, no cumulative adverse noise or vibration impacts are anticipated under the Underground Emphasis LRT Alternative.

5.4.7 Geotechnical/Subsurface/Seismic/Hazardous Materials

5.4.7.1 Direct Impacts

Geotechnical/Subsurface/Seismic

The Underground Emphasis LRT Alternative proposed alignment would not cross any known faults. However, portions of the proposed alignment occur in areas mapped with the potential for liquefaction based on soil stability. Areas susceptible to liquefaction are along Flower Street between Wilshire Boulevard and 2nd Street, and along 2nd Street between Hill and San Pedro Streets. A limited portion of the alignment near 1st and Alameda Streets would be within the mapped Inundation Hazard Area. In addition, the proposed 2nd/Hope Street station would be within the Hillside Ordinance area (Bunker Hill).

During construction of underground stations, portal, and the Alameda Street underpass, there would be potential for adverse impacts related to ground settlement and differential settlement on adjacent structures, including historical buildings. Further evaluation and survey would be performed during final design to establish building types, existing conditions, and to develop criteria to limit potential movement to acceptable thresholds. Protection of buildings could involve design of adequately rigid excavation support systems, underpinnings, and ground improvements to minimize settlement to tolerable limits. In addition, a pre-construction survey of the adjacent structures and all historical buildings in the vicinity would be conducted to establish a baseline for measuring potential construction-induced damage. TBMs, cut and cover, and SEM would potentially be used to construct the underground portions of the alignment, and appropriate shoring would be used as needed. TBM operations would not be expected to directly affect building foundations. However, construction monitoring would be utilized during to ensure that movement does not exceed the threshold values. With mitigation, less-than-significant impacts are anticipated.

The laying of surface track work and building of stations and portal structures would likely require removal of protective vegetation and pavement, which would increase the potential for soil erosion. With mitigation, potential adverse construction impacts associated with subsurface soils would be considered less than significant.

Hazardous Materials

Construction of the Underground Emphasis LRT Alternative would entail excavation along most of the proposed alignment, during which contaminated soil and groundwater could be encountered. As described in the Hazardous Materials Technical Memorandum, known and suspected soil and groundwater contamination exists on properties along the proposed

alignment. Lead may be present in surface soils from historical vehicle emissions of older automobiles using leaded gasoline, and PCBs may exist in surface or subsurface soils from leaking transformers. If released during excavation, there would be potential for impacts to human health and the environment from these hazardous materials. Until further study is conducted, the actual levels of hazardous materials that could be encountered in soil and groundwater during construction are unknown. Without mitigation, potential adverse impacts are anticipated.

5.4.7.2 Indirect Impacts

No indirect adverse geotechnical, subsurface, seismic, or hazardous materials impacts are anticipated during construction of the Underground Emphasis LRT Alternative.

5.4.7.3 Cumulative Impacts

No cumulative adverse geotechnical, subsurface, seismic, or hazardous materials impacts are anticipated during construction of the Underground Emphasis LRT Alternative.

5.4.8 Water Quality

5.4.8.1 Direct Impacts

According to the Geotechnical/Subsurface/Seismic/ Hazardous Materials Technical Memorandum, there is known and/or suspected soil and/or groundwater contamination along the proposed alignment. Construction activities have the potential to increase erosion and sedimentation around proposed construction and staging areas. Grading activities associated with construction could potentially result in a temporary increase in the amount of suspended solids running off construction sites. In the case of a storm event, construction site runoff could result in sheet erosion of exposed soil. Groundwater may be encountered during trenching or tunneling which would require dewatering. Dewatering activity would result in the potential release of contaminated water due to the presence of relatively shallow groundwater (located at depths ranging from 14 to 36 feet) that is contaminated with pollutants common to urban development. All dewatering activity would occur with a NDPES permit. Testing would occur prior to construction and on-site treatment and discharge in accordance with applicable standards or transport to a treatment or disposal facility would be required. Without mitigation, potential adverse construction impacts associated with water quality are anticipated under the Underground Emphasis LRT Alternative.

5.4.8.2 Indirect Impacts

No indirect adverse construction impacts associated with water quality are anticipated under the Underground Emphasis LRT Alternative.

5.4.8.3 Cumulative Impacts

No cumulative adverse construction impacts associated with water quality are anticipated under the Underground Emphasis LRT Alternative.

5.4.9 Energy

5.4.9.1 Direct Impacts

The highest indirect energy consumption would occur during site clearance and construction of guideways, structures, stations, and support facilities. Construction of the Underground Emphasis LRT Alternative would consume a one-time amount of approximately 5,000 billion BTUs. LADWP is committed to increasing electricity generation from renewable energy sources and ensuring a reliable flow of electricity to users in its service area. The one-time energy use required to construct this alternative would be offset by the project's long-term, beneficial operational impacts. Given the long-term, beneficial decreases in energy use, potential construction-related impacts would be less than significant.

5.4.9.2 Indirect Impacts

No indirect adverse construction impacts associated with energy are anticipated under the Underground Emphasis LRT Alternative.

5.4.9.3 Cumulative Impacts

No cumulative adverse construction impacts associated with energy are anticipated under the Underground Emphasis LRT Alternative.

5.4.10 Climate Change

5.4.10.1 Direct Impacts

No direct adverse construction impacts associated with climate change are anticipated under the Underground Emphasis LRT Alternative.

5.4.10.2 Indirect Impacts

No indirect adverse construction impacts associated with climate change are anticipated under the Underground Emphasis LRT Alternative.

5.4.10.3 Cumulative Impacts

The construction of the Underground Emphasis LRT Alternative would result in GHG emissions from diesel-fueled construction equipment. Emissions would be produced by onsite equipment, offsite worker vehicles, and offsite haul trucks. A total of approximately 100,600 metric tons per year of GHG emissions would be produced during all phases of construction under the Underground Emphasis LRT Alternative (see the Climate Change Technical Memorandum for more details).

The proposed project would result in a decrease in GHG emissions compared to the No Build Alternative and, due to regional growth unrelated to the project, an increase in GHG emissions compared to existing conditions (2009). The Underground Emphasis LRT Alternative is consistent with CARB's Scoping Plan requirement to reduce GHG emissions. It is expected that other projects operating in 2035 would be consistent with the emission reduction targets of SB 375 and the Regional Transportation Plan. As a result, potential emissions would not be cumulatively significant.

5.4.11 Historic, Archaeological, and Paleontological Resources

5.4.11.1 Direct Impacts

Historic Resources

Potential effects, but no adverse effects, would result from dirt from construction activities, changes in access during construction, visual changes during construction, demolition and takes, construction of underground stations, installation of catenary poles and TPSS. The effects would be short-term and would not alter characteristics of historic properties in a manner that would diminish the integrity of the properties' location, design, setting, materials, workmanship, feeling, or association.

The proposed train portal at the intersection of Alameda and 1st Street would be within the viewshed of two historic properties, the Little Tokyo National Historic Landmark Historic District and the NRHP eligible John A. Roebling Sons Co. Building (APE Map #7-35). However, the portal area is not encompassed within the boundary of a historic property, historical resource, or a contributing element to the significance of either property. An asphalt paved parking lot currently occupies the majority of the parcel. No adverse effect would occur to the Little Tokyo National Historic Landmark District or the John A. Roebling Sons Co Building from the construction of the portal.

Several NRHP and/or CRHR eligible properties could be potentially affected by cut and cover construction, differential settlement, and construction noise and vibration associated with construction of the Underground Emphasis LRT Alternative. The implementation of design measures would protect and stabilize the ground near historic properties as noted in MM-BE-2, MM-BE-3, and MM-BE-5. These measures would avoid adverse effects to all properties. If properly implemented, short term construction activities would not directly alter a characteristic of the historic property in a manner that would diminish the integrity of the property's location, design, setting, materials, workmanship, feeling, or association.

Archaeological Resources

The Underground Emphasis LRT Alternative involves substantial ground disturbance, and therefore has the potential to alter, remove, or destroy archaeological resources within the APE. It has the potential to affect archaeological resources during ground disturbance from constructing a new underground tunnel along its entire route; underground stations on 2nd

Street (either at Broadway or at Los Angeles Street), 2nd/Hope Street, and Flower/5th/4th Streets; an automobile underpass on Alameda Street between 2nd and Temple Streets; and a potential pedestrian bridge at the intersection of Alameda and 1st Streets.

Potentially affected resources include site CA-LAN-3588 and the Los Angeles zanja system (specifically Zanjas 3, 4, 5, and 8; see Figure 4-1). Although the precise location and local integrity of the zanjas have not been established, the project's 2nd Street alignment likely crosses the system multiple times.

Archaeological remains associated with these sites may extend into the project area and be subject to direct alteration. This would result in a significant effect that could be mitigated. Construction of new stations would almost certainly affect any extant archaeological resources within their footprints. Construction of new tunnel segments through deep tunneling, as opposed to cut-and-cover techniques, could avoid effects to shallow archaeological resources, although the maximum depth of these resources and minimum depth of construction would both need to be established prior to reaching this conclusion. Implementing MM-A-1 and MM-A-2 would reduce this effect to a less-than-significant level.

Paleontological Resources

The Underground Emphasis LRT Alternative involves ground disturbance and therefore has the potential to adversely impact paleontological resources within the project area. This disturbance would result from excavations related to construction of a new underground tunnel along most of the alignment; new underground stations at Flower/5th/4th Street, 2nd/Hope Street, 2nd Street station (either at Broadway or at Los Angeles Street); an automobile underpass on Alameda Street between 2nd Street and Temple Street; and a proposed pedestrian bridge at the intersection of Alameda and 1st Streets. Any ground disturbances in areas of high sensitivity (See Figure 4-3) will have the potential to impact paleontological resources at the surface and at depth; areas of ground disturbance in areas of sensitivity ranging from low to high have the potential to impact paleontological resources at a depth of 5 feet or more below the ground surface. In areas where proper mitigation measures (Section 6.1) can be implemented, potential impacts can be reduced to a less than significant level. In areas where new underground TBM segments would be constructed, mitigation for paleontological resources will not be feasible and are thus unavoidable.

5.4.11.2 Indirect Impacts

The construction of the Underground Emphasis LRT Alternative would have the potential to indirectly impact historical resources during cut and cover construction, underpass construction at Alameda and 1st Streets, portal construction, and TBM tunneling. The impacts would be indirect because the construction activities themselves would not damage

historical properties, but vibration and possible subsidence of soils could impact the historical integrity of buildings. Mitigation would minimize the potential adverse impacts.

5.4.11.3 Cumulative Impacts

No cumulative adverse construction impacts associated with historical, archaeological, and paleontological resources are anticipated under the Underground Emphasis LRT Alternative.

5.4.12 Ecosystems and Biological Resources

5.4.12.1 Direct Impacts

During construction of the Underground Emphasis LRT Alternative, some mature trees containing nesting could be removed. As these mature trees may provide potential nesting and roosting habitat for bird species, including raptors, removal or disturbance of this vegetation during the nesting season could directly impact the habitat and any bird species that are present. There are currently 170 mature trees in the area that could potentially be affected by construction, and some of these trees could be removed or disturbed during construction. It is unknown at this time exactly how many trees could be affected. An estimated 40 native California sycamore trees are located in the potential area of impact and could be affected by this alternative. As project design progresses it may be possible to minimize the number of sycamores affected by avoidance or fencing. The details of these impacts and mitigation measures are presented in the Ecosystems/Biological Resources Technical Memorandum. Potential mitigation measures are described in Section 6 and include compliance with the Native Tree Protection Ordinance. Compliance with the Native Tree Protection Ordinance, including replacement of this protected species at a 2:1 ratio, would reduce this potential impact to a less than significant level.

5.4.12.2 Indirect Impacts

Direct impacts to birds and their habitat by removing or disturbing mature trees have the potential to cause indirect impacts elsewhere. If birds are forced to relocate to new areas during the nesting season, increased competition for food and nesting habitat would be a potential indirect impact.

However, because the downtown area provides only low quality habitat for migratory birds, these potential impacts are not considered to be significant because only a small number of birds (if any) could be displaced. Further, mitigation taken to comply with the MBTA and the California Fish and Game Code would reduce potential indirect impacts to a less-than-significant level.

5.4.12.3 Cumulative Impacts

No cumulative adverse construction impacts associated with ecosystems or biological resources are anticipated under the Underground Emphasis LRT Alternative.

5.4.13 Parklands and Other Community Facilities

5.4.13.1 Direct Impacts

A large portion of the alignment of the Underground Emphasis LRT Alternative would be constructed underground using TBMs, so access restrictions on 2nd Street would be limited to staging areas. However, where there would be cut and cover, temporary road closures would be needed. Access to the parking structure beneath Maguire Gardens and pedestrian access to the gardens would be temporarily restricted. Locations along the alignment that could experience modified pedestrian and vehicle access during construction include the new LAPD headquarters, Caltrans, the Little Tokyo Branch Public Library, MOCA, Go For Broke Monument, and JANM. Response times for emergency services could also be impacted, but less than the At-Grade Emphasis LRT Alternative on 2nd Street. Without mitigation, potential adverse construction impacts associated with parklands and other community facilities are anticipated under the Underground Emphasis LRT Alternative.

5.4.13.2 Indirect Impacts

Although construction impacts are direct by nature, the construction of the Underground Emphasis LRT Alternative alignment could potentially discourage patrons of community facilities and parks due to restricted access and temporary parking restrictions. Mitigation could include signs, detour routes, and temporary replacement parking to encourage pedestrian and vehicular access to these community facilities. Without mitigation, potential adverse impacts are anticipated.

5.4.13.3 Cumulative Impacts

No cumulative adverse construction impacts associated with parklands or other community facilities are anticipated under the Underground Emphasis LRT Alternative.

5.4.14 Economic Vitality and Employment Opportunities

5.4.14.1 Direct Impacts

The construction of the Underground Emphasis LRT Alternative would result in fewer adverse economic impacts in the project area than the At-Grade Emphasis LRT Alternative. Depending on the construction techniques used, there would be a need for phased street closure, but the economic effects would be less pronounced than at-grade track construction. The potential economic impacts caused by the Underground Emphasis LRT Alternative would be primarily limited to the station sites, portal location and underpass location.

Temporary closures or restricted access to Alameda and 1st Streets during construction of the underpass and pedestrian bridge would impact a heavily utilized truck route and also restrict freeway access to Little Tokyo. Cultural institutions, such as MOCA and JANM, and businesses could potentially be impacted directly.

Investment in transportation, including direct investment in the form of capital construction and operations costs, would provide economic benefits through the creation of direct and indirect jobs and spending by suppliers whose goods and services are used for the project. These benefits are discussed further in the Economic and Fiscal Impacts Technical Memorandum. The benefits of the additional transit infrastructure in the long-term would outweigh the temporary significant impacts in the project area.

5.4.14.2 Indirect Impacts

As discussed in Section 5.4.3, construction of the Underground Emphasis LRT Alternative would result in the temporary closure of several streets throughout the project area. During utility relocation and lane closures, traffic would be diverted to surrounding streets. The traffic diversions and parking restrictions could potentially impact the economic viability of businesses adjacent to the closures, though to a lesser extent than the At-Grade Emphasis LRT Alternative. Although these construction impacts would be short-term and intermittent, they would be considered potentially adverse without mitigation.

5.4.14.3 Cumulative Impacts

No cumulative adverse construction impacts associated with economic vitality are anticipated under the Underground Emphasis LRT Alternative.

5.4.15 Safety and Security

5.4.15.1 Direct Impacts

The contractor will have a safety plan and be responsible for construction site security in conformance with local regulations and standards. Construction activities are not anticipated to affect security in the project area. Construction and staging areas would typically be fenced off and well lit. A large portion of the construction would occur underground, separated from pedestrians and vehicles. No direct adverse impacts associated with safety and security are anticipated.

5.4.15.2 Indirect Impacts

No indirect adverse construction impacts associated with safety and security are anticipated under the Underground Emphasis LRT Alternative.

5.4.15.3 Cumulative Impacts

No cumulative adverse construction impacts associated with safety and security are anticipated under the Underground Emphasis LRT Alternative.

5.5 Fully Underground LRT Alternative – Little Tokyo Variation 1

The Fully Underground LRT Alternative – Little Tokyo Variation 1 would extend from the 7th Street/Metro Center Station northward in a cut and cover tunnel below Flower Street with a

new underground station north of 5th Street. At 3rd Street, the underground tunnel would extend east with a new underground station near 2nd and Hope Streets to provide access to Bunker Hill. The station would be constructed using either the open cut method or SEM. From there, a tunnel excavated by TBM would continue east beneath 2nd Street. A third underground station would be located between Broadway and Spring Street. The tunnel would continue along 2nd Street under Little Tokyo to Central Avenue. Until this point, the alignment would be the same as the Underground Emphasis LRT Alternative – Broadway Station Option. A fourth underground station would be constructed using the cut and cover method at the block bounded by Central Avenue and 1st, 2nd, and Alameda Streets. This station would replace the existing Little Tokyo/Arts District at-grade station. The alignment would emerge to at-grade connections with the existing Gold Line tracks via two portals: one northeast of Temple and Alameda Streets for the North-South Line, and one on 1st Street east of Alameda Street for the East-West Line.

The analysis of the potential impacts that these construction activities could have are discussed for all environmental topic areas except for Land Use and Growth-Inducing Impacts because construction activities do not tend to have impacts in these topic areas.

5.5.1 Traffic and Parking

5.5.1.1 Direct Impacts

Permanent Impacts From Construction

Construction of the Fully Underground LRT Alternative – Little Tokyo Variation 1, would result in the permanent loss of approximately seven on-street parking spaces. The details of these impacts and mitigation measures are presented in the Transportation Impacts Technical Memorandum. Additional parking spaces that would be temporary lost during construction activities are described below.

Construction-Related Impacts

For this build alternative, temporary lane changes due to construction activities would be the same as the Underground Emphasis LRT Alternative west of Central Avenue. This would result in the temporary reduction of roadway capacity and potential modification of existing traffic patterns to bypass construction activities. The construction of the proposed Alameda Street portal north of Temple Street would result in the reduction of roadway capacity for extended time periods during construction. Two through travel lanes would be maintained in each direction along Alameda Street from Temple Street northwards, tapering back to three through lanes in each direction near Aliso Street. As a result of this configuration, the two-way left turn median in the mid-block area and the exclusive right and left turn lanes at the southbound intersection approach at Temple Street would be temporarily eliminated over the period needed to construct the portal. The southbound intersection lane configuration at Temple Street would consist of a shared through and right turn lane and a shared through and left turn lane. The existing signal phasing may be changed to split phasing to minimize

conflicts between southbound left turns and the opposing northbound through movements. This would help prevent the formation of queues behind vehicles waiting for a gap in opposing traffic to complete left turn movements. Consequently, travel times for vehicles along this segment of Alameda Street would be expected to increase due to the potential for additional congestion and changed operating conditions at the intersection of Temple and Alameda Streets.

On 1st Street between Alameda and Vignes Streets, one through travel lane in each direction would need to be removed temporarily during construction. This could cause additional congestion. However, the 1st Street bridge is currently operating one-way eastbound with only two lanes, and lengthy delays do not frequently occur.

Parking impacts due to construction activities would be the same as the Underground Emphasis LRT Alternative west of Central Avenue (unless the entire block is required for construction, in which case, additional off-street parking would be lost; see the Transportation Technical Memorandum for more details). The construction of the proposed Alameda Street portal north of Temple Street would result in the displacement of loading areas for extended time periods during construction.

Construction activities and impacts to pedestrian and bicycle flow for this alternative would be the same as the Underground Emphasis LRT Alternative west of Central Avenue. The construction of the proposed Alameda Street portal north of Temple Street would result in the reduction of roadway capacity for extended time periods during construction activities and the elimination of the sidewalk on the east side of Alameda Street. Roadway capacity would also be temporarily reduced on 1st Street between Alameda and Vignes Streets. These capacity reductions could potentially impact both pedestrian and bicycle flow.

The operational phase of the Fully Underground LRT Alternative – Little Tokyo Variation 1 would result in the restoration of the travel lanes and parking, pedestrian, and bicycle facilities to their permanent configurations. Potential short term, adverse impacts are anticipated during construction of this alternative.

5.5.1.2 Indirect Impacts

Impacts from construction-related activities would be temporary and direct in nature. No indirect impacts are anticipated from traffic circulation or parking under the Fully Underground LRT Alternative – Little Tokyo Variation 1.

5.5.1.3 Cumulative Impacts

Impacts to traffic circulation during construction would be short term, but would contribute to a potential cumulative adverse effect when added to other projects in the downtown area. Potential cumulative adverse traffic circulation impacts are anticipated under the Fully Underground LRT Alternative - Little Tokyo Variation 1.

5.5.2 Displacements and Relocation

5.5.2.1 Direct Impacts

Permanent Impacts During Construction Period

Compared to the Underground Emphasis LRT Alternative, up to five additional full takes, one fewer partial take, and two additional permanent underground easements would be required to construct the Fully Underground LRT Alternative – Little Tokyo Variation 1. These properties would be utilized for construction staging, below grade tunneling, and station construction. The details of these impacts and mitigation measures are presented in the Displacements and Relocation of Existing Uses Technical Memorandum.

Construction-Related Impacts

During construction of the Fully Underground LRT Alternative – Little Tokyo Variation 1, staging of equipment and materials would require temporary construction easements that would impact three fewer parcels than the Underground Emphasis LRT Alternative (five parcels in total). The portions of these parcels that would be utilized would be plazas and open areas. Access to businesses and existing buildings would be maintained. Sidewalks and detour routes would also be configured as needed. Mitigation would minimize the potential adverse impacts associated with this type of displacement during construction. In addition, once construction is completed, the sites would be restored to their permanent configurations.

5.5.2.2 Indirect Impacts

Displacement impacts are direct in nature. Therefore, no indirect construction impacts associated with displacement are anticipated.

5.5.2.3 Cumulative Impacts

No cumulative adverse construction impacts associated with displacements or relocation are anticipated under the Fully Underground LRT Alternative – Little Tokyo Variation 1.

5.5.3 Community and Neighborhoods

5.5.3.1 Direct Impacts

Similar to the Underground Emphasis LRT Alternative, mobility would be reduced in the Financial District, Bunker Hill, Civic Center, Historic Core \ and Little Tokyo areas due to street closures associated with construction activities including track installation, cut and cover excavation, TBM deployment, and structural support work for the Fully Underground LRT Alternative – Little Tokyo Variation 1. Disruption of traffic patterns would restrict, but not eliminate, access to residences and businesses, though to a lesser extent than the At-Grade Emphasis LRT Alternative and the Underground Emphasis LRT Alternative. In Little Tokyo, there would be less disruption to traffic along Alameda and 1st Streets than the Underground Emphasis LRT Alternative because this alternative does not include the excavation and

construction of the Alameda Street underpass or construction of the potential pedestrian bridge across Alameda Street. However, the cut and cover construction of the rail junction beneath the intersection of 1st and Alameda Streets could still cause disruption. The installation of TBMs either at Little Tokyo or Bunker Hill could pose temporary disruptions for businesses and residents, particularly Savoy and Honda Plaza in Little Tokyo and the Bunker Hill Towers. Without mitigation, potential adverse construction impacts associated with community and neighborhoods are anticipated under the Fully Underground LRT Alternative – Little Tokyo Variation 1.

5.5.3.2 Indirect Impacts

During utility relocation, mobility would be reduced in the Civic Center, the Historic Core, and Little Tokyo areas. Disruption of traffic patterns would access for residents and businesses, though to a lesser extent than the At-Grade Emphasis LRT Alternative and the Underground Emphasis LRT Alternative. This could impact the economic vitality of some businesses, particularly in Little Tokyo, where the community has expressed concern about construction activities. Prolonged disruption to businesses could affect the cohesion of some communities, including Little Tokyo. Without mitigation, potential adverse indirect construction impacts associated with community and neighborhoods are anticipated under the Fully Underground LRT Alternative – Little Tokyo Variation 1.

5.5.3.3 Cumulative Impacts

No cumulative adverse construction impacts associated with communities or neighborhoods are anticipated under the Fully Underground LRT Alternative – Little Tokyo Variation 1.

5.5.4 Visual Resources and Aesthetics

5.5.4.1 Direct Impacts

Views and Visual Character

During construction of the Fully Underground LRT Alternative – Little Tokyo Variation 1, the same construction staging as the Underground Emphasis LRT Alternative would be used. Impacts associated with views and visual character would be similar to the Underground Emphasis LRT Alternative.

Lighting

Most of the construction would be conducted beneath the surface. In some locations along the surface, temporary lighting may be necessary for nighttime construction, which is typically scheduled in order to minimize disruption to daytime traffic and for nighttime lighting for staging sites, primarily for security. However, nighttime construction activities would be limited to non-residential areas and nighttime illumination of staging areas would be directed towards the site and away from sensitive uses. Therefore, less-than-significant impacts are anticipated.

5.5.4.2 Indirect Impacts

No indirect adverse construction impacts associated with visual resources are anticipated under the Fully Underground LRT Alternative – Little Tokyo Variation 1.

5.5.4.3 Cumulative Impacts

No cumulative adverse construction impacts associated with visual resources are anticipated under the Fully Underground LRT Alternative – Little Tokyo Variation 1

5.5.5 Air Quality

5.5.5.1 Direct Impacts

Regional Construction Emissions

Additional excavation needed for the underground station at 2nd Street and Central Avenue as well as the underground junction beneath Alameda and 1st Streets would cause the Fully Underground LRT Alternative – Little Tokyo Variation 1 to have greater construction emissions than the Underground Emphasis LRT Alternative. Additional truck trips to dispose of excavated material would also be needed. This would result in an increase in NO_x and diesel particulate matter emissions. An analysis of construction-related emissions was completed in accordance with SCAQMD requirements. The estimate included emissions from off-road construction equipment, fugitive dust, construction worker commuting, and haul trucks. Table 5-10 provides a summary of anticipated construction emissions during the peak of construction for the entire project area.

Table 5-10. Fully Underground LRT Alternative – Little Tokyo Variation 1 (2014-2017) Maximum Daily Regional Construction Emissions

Daily Emissions (pounds/day)						
Location	VOC	NOx	CO	SO_2	PM_{10}	$PM_{2.5}$
2nd/Hope Street station (SEM)						
Onsite	**367**	**2,596**	**1,474**	5	105	**95**
Offsite	10	104	69	<1	24	7
Total	**377**	**2,699**	**1,542**	5	129	**102**
2nd/Hope Street station (Open Cut)						
Onsite	**376**	**2,670**	**1,523**	5	108	**98**

Table 5-10. Fully Underground LRT Alternative – Little Tokyo Variation 1 (2014-2017) Maximum Daily Regional Construction Emissions

Daily Emissions (pounds/day)						
Location	VOC	NOx	CO	SO_2	PM_{10}	$PM_{2.5}$
Offsite	10	107	71	<1	24	7
Total	**386**	**2,777**	**1,593**	5	133	**105**
Threshold	75	100	550	150	150	55

*Note: Significant emissions are shown in **bold.***
Source: CDM, Metro Regional Connector Air Quality Technical Memorandum, 2010.

Use of electric construction equipment could be encouraged where feasible. Daily regional construction emissions are anticipated to exceed SCAQMD regional significance thresholds for VOC, NO_x, CO, and $PM_{2.5}$ and would result in a potential adverse effect without mitigation.

Localized Construction Emissions

In addition to evaluating emissions on a regional level, construction emissions were also compared to SCAQMD's localized significance thresholds. The maximum localized construction emissions would occur during cut and cover construction of the tunnel along Flower Street, cut and cover construction of the Flower/5th/4th Street station, and cut and cover construction of the 2nd Street/Broadway station. The maximum daily localized emissions would be approximately 300 ppd of NO_x, 170 ppd of CO, 11 ppd of $PM_{2.5}$ and 13 ppd of PM_{10}. Daily construction emissions are anticipated to exceed SCAQMD localized significance thresholds for NO_x, and PM_{10}, and $PM_{2.5}$ and would result in a potential adverse localized air quality construction effect.

5.5.5.2 Indirect Impacts

Construction of the Fully Underground LRT Alternative – Little Tokyo Variation 1 would result in indirect emissions of TACs. Emissions from the project were compared to existing conditions (2009) for CEQA. A summary of the results of the Tier 1 HRA are provided in Table 5-11. Since VOC emissions will decrease in future years because of the improvement in engine technology, the HRA was not conducted for VOC emissions. Instead, it was restricted to inorganic emissions. The Fully Underground LRT Alternative – Little Tokyo Variation 1 would not generate significant construction emissions of TACs under CEQA.

5.5.5.3 Cumulative Impacts

Daily regional and localized construction emissions are anticipated to exceed SCAQMD regional significance thresholds and would result in a potential adverse cumulative effect without mitigation.

5.5.6 Noise and Vibration

5.5.6.1 Direct Impacts

The anticipated construction activities and equipment and the related noise levels for the Fully Underground LRT Alternative – Little Tokyo Variation 1 would be the same as shown in Table 5-9 for the Underground Emphasis LRT Alternative.

The construction of the underground alignment along Alameda and 1st Streets would result in additional areas of noise and vibration beyond those identified for the Underground Emphasis LRT Alternative. Additional exposure to sensitive receptors adjacent to these areas is expected. Construction activities would result in the same levels of noise and vibration described under the Underground Emphasis LRT Alternative. The closer proximity of these activities to sensitive receptors along Alameda and 1st Streets would intensify the level of impacts compared to the Underground Emphasis LRT Alternative.

The construction activities with the greatest potential to cause noise impacts would be: cut and cover construction along Flower Street, cut and cover construction of the Flower/5th/4th Street station, cut and cover construction of the approach to the 2nd/Hope Street station, construction of the 2nd/Hope Street station, cut and cover construction of the 2nd Street /Broadway station, and open cut construction of the 2nd Street/Central Avenue station. These activities would have the greatest potential for noise impacts due to the duration of the proposed work and proximity to noise sensitive land uses.

Table 5-11. Fully Underground LRT Alternative – Little Tokyo Variation 1 (2014-2017) Toxic Air Contaminant Construction Emissions and HRA

TAC	CAS #	Emissions (pounds/hr)		PSL	PSI	
		2nd/Hope Station SEM	2nd/Hope Station Open Cut	(lb/hr)	2nd/Hope Station SEM	2nd/Hope Station Open Cut
Arsenic	7440-38-2	2.35E-05	2.43E-05	1.00E-04	2.35E-01	2.43E-01
Chlorine	7782-50-5	1.82E-03	1.90E-03	1.05E-01	1.74E-02	1.81E-02
Copper	7440-50-8	1.19E-04	1.23E-04	5.00E-02	2.38E-03	2.46E-03
Mercury	7439-97-6	1.31E-04	1.35E-04	9.00E-04	1.46E-01	1.50E-01
Nickel	7440-02-0	8.80E-05	9.11E-05	3.00E-03	2.93E-02	3.04E-02
				ASI	4.29E-01	4.44E-01
				Threshold	1.0	

Notes:
ASI = application screening index (total PSI)
CAS = Chemical Abstracts Service
lb/hr = pounds per hour
PSI = pollutant screening index (PSL divided by project emissions)
PSL = pollutant screening level (minimum level expected to exceed health risk)
TAC = toxic air contaminant
Source: CDM, Metro Regional Connector Air Quality Technical Memorandum, 2010.

Under the Fully Underground LRT Alternative – Little Tokyo Variation 1, the at-grade junction and underpass on Alameda Street would not be constructed. This would remove a noise source in the Little Tokyo community that would last for a two to three year period under the At-Grade and Underground Emphasis LRT Alternatives. However, noise would still be generated by construction of the underground junction beneath 1st and Alameda Streets and the new portals on 1st Street and near Temple and Alameda Streets. Adverse effects from construction noise would still be expected without the implementation of mitigation measures.

The potential for construction vibration to cause building damage and annoyance impacts would be the same as identified for the Underground Emphasis LRT Alternative. Without the implementation of mitigation measures, vibration impacts would be potentially significant under the Fully Underground LRT Alternative – Little Tokyo Variation 1.

5.5.6.2 Indirect Impacts

Impacts from construction-related activities are temporary and direct in nature. No indirect impacts are anticipated from noise or vibration under the Fully Underground LRT Alternative – Little Tokyo Variation 1.

5.5.6.3 Cumulative Impacts

Impacts from noise and vibration during construction would be short term and would not contribute to a cumulative adverse effect. Therefore, no cumulative adverse noise or vibration impacts are anticipated under the Fully Underground LRT Alternative – Little Tokyo Variation 1.

5.5.7 Geotechnical/Subsurface/Seismic/Hazardous Materials

5.5.7.1 Direct Impacts

Geotechnical/Subsurface/Seismic

The proposed Fully Underground LRT Alternative – Little Tokyo Variation 1 alignment would not cross any known faults. However, portions of the proposed alignment occur in areas mapped with the potential for liquefaction based on soil stability. Areas susceptible to liquefaction are on Flower Street between Wilshire Boulevard and 2nd Street, and along 2nd Street between Hill and San Pedro Streets. The portion of the alignment near the intersection of 1st and Alameda Streets would be within the mapped Inundation Hazard Area. In addition, the proposed 2nd/Hope Street station would be within the Hillside Ordinance area (Bunker Hill).

Geotechnical, subsurface, and seismic impacts during construction of the Fully Underground LRT Alternative – Little Tokyo Variation 1 would be similar to those of the Underground Emphasis LRT Alternative during construction. Section 5.4.7.1 contains further analysis.

Hazardous Materials

Construction of the Fully Underground LRT Alternative – Little Tokyo Variation 1 would entail excavation along most of the proposed alignment, during which contaminated soil and groundwater could be encountered. Hazardous material impacts during construction of the Fully Underground LRT Alternative – Little Tokyo Variation 1 would be similar to those of the Underground Emphasis LRT Alternative during construction. Section 5.4.7.1 contains further analysis.

5.5.7.2 Indirect Impacts

No indirect adverse geotechnical, subsurface, seismic, or hazardous materials impacts are anticipated during construction of the Fully Underground LRT Alternative – Little Tokyo Variation 1.

5.5.7.3 Cumulative Impacts

No cumulative adverse geotechnical, subsurface, seismic, or hazardous materials impacts are anticipated during construction of the Fully Underground LRT Alternative – Little Tokyo Variation 1.

5.5.8 Water Quality

5.5.8.1 Direct Impacts

Water quality impacts during construction of the Fully Underground LRT Alternative – Little Tokyo Variation 1 would be similar to those of the Underground Emphasis LRT Alternative during construction. Section 5.4.8.1 contains further analysis.

5.5.8.2 Indirect Impacts

No indirect adverse construction impacts associated with water quality are anticipated under the Fully Underground LRT Alternative – Little Tokyo Variation 1.

5.5.8.3 Cumulative Impacts

No cumulative adverse construction impacts associated with water quality are anticipated under the Fully Underground LRT Alternative – Little Tokyo Variation 1.

5.5.9 Energy

5.5.9.1 Direct Impacts

The highest indirect energy consumption would occur during site clearance and construction of guideways, stations, and support facilities. Construction of the Fully Underground LRT Alternative – Little Tokyo Variation 1 would result in a temporary energy demand of approximately 6,000 billion BTUs. This impact would be temporary, and the project would result in long-term, beneficial decreases in energy use in the region. LADWP is committed to increasing electricity generation from renewable energy sources and ensuring a reliable flow of electricity to users in its service area. Given the long-term, beneficial decreases in energy use associated with this alternative; potential construction-related impacts would be less than significant.

5.5.9.2 Indirect Impacts

No indirect adverse construction impacts associated with energy are anticipated under the Fully Underground LRT Alternative – Little Tokyo Variation 1.

5.5.9.3 Cumulative Impacts

No cumulative adverse construction impacts associated with energy are anticipated under the Fully Underground LRT Alternative – Little Tokyo Variation 1.

5.5.10 Climate Change

5.5.10.1 Direct Impacts

No direct adverse construction impacts associated with climate change are anticipated under the Fully Underground LRT Alternative – Little Tokyo Variation 1.

5.5.10.2 Indirect Impacts

No indirect adverse construction impacts associated with climate change are anticipated under the Fully Underground LRT Alternative – Little Tokyo Variation 1.

5.5.10.3 Cumulative Impacts

The construction of the Fully Underground LRT Alternative – Little Tokyo Variation 1 would result in GHG emissions from diesel-fueled construction equipment. Emissions would be generated by onsite equipment, offsite worker vehicles, and offsite haul trucks. An approximate total of 118,300 metric tons per year of GHG emissions would be produced during all phases of construction for the Fully Underground LRT Alternative – Little Tokyo Variation 1.

The proposed alternative would result in a decrease in GHG emissions compared to the No Build Alternative and, due to regional growth unrelated to the project, an increase in GHG emissions compared to existing conditions (2009). The Fully Underground Alternative – Little Tokyo Variation 1 is consistent with CARB's Scoping Plan requirement to reduce GHG emissions. It is expected that other projects operating in 2035 would be consistent with the emission reduction targets of SB 375 and the Regional Transportation Plan. As a result, emissions would not be cumulatively significant.

5.5.11Historic, Archaeological, and Paleontological Resources

5.5.11.1 Direct Impacts

The Fully Underground LRT Alternative – Little Tokyo Variation 1 would have the potential to alter, remove, or destroy archaeological and paleontological resources within the APE due to the creation of a new underground tunnel along its entire route and four new underground stations. Potential archaeological and paleontological impacts during construction of the Fully Underground LRT Alternative – Little Tokyo Variation 1 would be similar to those of the Underground Emphasis LRT Alternative. Section 5.4.11.1 contains further analysis.

5.5.11.2 Indirect Impacts

The construction of the Fully Underground LRT Alternative – Little Tokyo Variation 1 would have the potential to indirectly impact historical resources during cut and cover tunnel and station construction, portal construction, and TBM tunneling. The potential impacts would be indirect because the construction activities themselves would not damage historical

properties, but vibration and possible subsidence of soils could impact their historical integrity. Mitigation would minimize the potential adverse impacts.

5.5.11.3 Cumulative Impacts

No cumulative adverse construction impacts associated with historical, archaeological, or paleontological resources are anticipated under the Fully Underground LRT Alternative – Little Tokyo Variation 1.

5.5.12 Ecosystems and Biological Resources

5.5.12.1 Direct Impacts

During construction of the Fully Underground LRT Alternative – Little Tokyo Variation 1, some mature trees containing nesting located along the proposed alignment could be removed, though less than the Underground Emphasis LRT Alternative. As these mature trees may provide potential nesting and roosting habitat for bird species, including raptors, removal or disturbance of this vegetation during the nesting season could directly impact the habitat and any bird species that are present. As no mature trees or other biological resources were observed in the area north and east of 1st and Alameda Streets, there are no additional direct impacts related to the Fully Underground LRT Alternative – Little Tokyo Variation 1. The same mitigation measures described in Section 6 would be required to reduce these potential impacts to a less-than-significant level.

5.5.12.2 Indirect Impacts

As with the other build alternatives, indirect impacts to migratory birds from the Fully Underground LRT Alternative- Little Tokyo Variation 1 would not be significant because the project area provides only low quality habitat for a small number of migratory birds and only a small number of birds (if any) could be displaced. Mitigation taken to comply with the MBTA and the California Fish and Game Code would reduce these potential indirect impacts to a less-than-significant level.

5.5.12.3 Cumulative Impacts

No cumulative adverse construction impacts associated with ecosystems or biological resources are anticipated under the Fully Underground LRT Alternative – Little Tokyo Variation 1.

5.5.13 Parklands and Other Community Facilities

5.5.13.1 Direct Impacts

A large portion of the alignment of the Fully Underground LRT Alternative – Little Tokyo Variation 1 would be constructed underground using TBM tunneling and cut-and-cover construction, so access restrictions on 2nd Street would be limited to staging areas. However,

temporary road closures would be needed in the vicinity of cut and cover construction activities. Access to the parking structure beneath Maguire Gardens and pedestrian access to the gardens would be temporarily restricted, but not removed, as in the Underground Emphasis LRT Alternative. Locations along the alignment that could experience modified pedestrian and vehicle access during construction and operation include the new LAPD headquarters, Caltrans, and the Little Tokyo Branch Public Library. Other community resources, particularly in Little Tokyo (MOCA, Go For Broke Monument, and JANM), would experience fewer impacts associated with restricted access because the Fully Underground LRT Alternative – Little Tokyo Variation 1 does not include surface track work, an underpass, or a pedestrian bridge at the intersection of Alameda and 1st Streets. Instead, an underground junction would be built at this location using the cut and cover method, along with portals near Temple and Alameda Streets and on 1st Street east of Alameda Street. Response times for emergency services could also be impacted, but to a lesser extent than the At-Grade Emphasis LRT Alternative. Without mitigation, potential adverse construction impacts associated with parklands and other community facilities are anticipated under the Fully Underground LRT Alternative – Little Tokyo Variation 1.

5.5.13.2 Indirect Impacts

Although construction impacts are direct by nature, the construction of the Fully Underground LRT Alternative – Little Tokyo Variation 1 alignment could potentially discourage patrons of community facilities and parks due to restricted access and temporary parking restrictions. Mitigation could include signs, detour routes, and temporary replacement parking to encourage pedestrian and vehicular access to these community facilities. Without mitigation, potential adverse impacts are anticipated.

5.5.13.3 Cumulative Impacts

No cumulative adverse construction impacts associated with parklands or community facilities are anticipated under the Fully Underground LRT Alternative – Little Tokyo Variation 1.

5.5.14 Economic Vitality and Employment Opportunities

5.5.14.1 Direct Impacts

The construction of the Fully Underground LRT Alternative – Little Tokyo Variation 1 would result in fewer adverse economic impacts in the project area than identified under the Underground Emphasis LRT Alternative. Depending on the construction techniques used, there may be a need for phased street closure. However, the economic effects of the closures would not be as severe as the Underground Emphasis LRT Alternative due to lack of elements such as construction of an at-grade junction in the intersection of 1st and Alameda Streets and an Alameda Street underpass and pedestrian bridge. Other elements such as the underground junction beneath 1st and Alameda Streets and the new portals at Temple and Alameda Streets and on 1st Street east of Alameda Street would also cause disruption. The

potential temporary economic impacts caused by construction of the Fully Underground LRT Alternative – Little Tokyo Variation 1 would be primarily limited to the station sites, and would be similar to the Underground Emphasis LRT Alternative.

Investment in transportation, including direct investment in the form of capital construction and operations costs, provides economic benefits through the creation of direct and indirect jobs, and investment and spending by suppliers whose goods and services are used in the project. These benefits are discussed in the Economic and Fiscal Impacts Technical Memorandum. The benefits of the additional transit infrastructure in the long-term would outweigh the temporary significant impacts in the project area.

5.5.14.2 Indirect Impacts

As discussed in the Section 5.5.3, construction of the Fully Underground LRT Alternative – Little Tokyo Variation 1 would result in the temporary closure of several streets. During utility relocation and lane closures, traffic would be diverted to surrounding streets. The traffic diversions and restricted parking could potentially impact the economic viability of businesses adjacent to the closures, though to a lesser degree than the At-Grade Emphasis LRT Alternative. Although these potential construction impacts would be short-term and intermittent, they would be considered potentially adverse without mitigation.

5.5.14.3 Cumulative Impacts

No cumulative adverse construction impacts associated with economic vitality are anticipated under the Fully Underground LRT Alternative – Little Tokyo Variation 1.

5.5.15 Safety and Security

5.5.15.1 Direct Impacts

The contractor will have a safety plan and be responsible for construction site security in conformance with local regulations and standards. Construction activities are not anticipated to affect security in the project area. Construction staging areas are typically fenced off and well lit. A large portion of the construction would occur underground, separated from pedestrians and vehicles. No direct adverse impacts associated with safety or security are anticipated under the Fully Underground LRT Alternative – Little Tokyo Variation 1.

5.5.15.2 Indirect Impacts

No indirect adverse construction impacts associated with safety or security are anticipated under the Fully Underground LRT Alternative – Little Tokyo Variation 1.

5.5.15.3 Cumulative Impacts

No cumulative adverse construction impacts associated with safety or security are anticipated under the Fully Underground LRT Alternative – Little Tokyo Variation 1.

5.6 Fully Underground LRT Alternative – Little Tokyo Variation 2

The Fully Underground LRT Alternative – Little Tokyo Variation 2 would extend from the 7th Street/Metro Center Station northward in a cut and cover tunnel below Flower Street with a new underground station north of 5th Street. At 3rd Street, the underground tunnel would extend east with a new underground station near 2nd and Hope Streets to provide access to Bunker Hill. This station could be constructed using either the open cut method or SEM. From there, a tunnel excavated by TBM would continue east beneath 2nd Street. A second underground station would be located between Broadway and Spring Street. The tunnel would continue along 2nd Street under Little Tokyo to Central Avenue. Until this point, the alignment would be the same as the Underground Emphasis LRT Alternative – Broadway Station Option. An underground two-level station would be located in the block bounded by Central Avenue and 1st, 2nd, and Alameda Streets. This station would replace the existing Little Tokyo/Arts District at-grade station. The alignment would emerge to at-grade connections with the existing Gold Line tracks via three portals: northeast of Temple and Alameda Streets for the North-South Line, and two staggered portals on 1st Street east of Alameda Street for the East-West Line.

The analysis of the potential impacts that these construction activities could have are discussed for all environmental topic areas except for Land Use and Growth-Inducing Impacts because construction activities do not tend to have impacts in these topic areas.

5.6.1 Traffic and Parking

5.6.1.1 Direct Impacts

Permanent Impacts During Construction

Construction of the Fully Underground LRT Alternative – Little Tokyo Variation 2, would result in the permanent loss of approximately seven on-street parking spaces. The details of these potential impacts and mitigation measures are presented in the Transportation Impacts Technical Memorandum. Additional parking spaces that would be temporarily lost during construction are described below.

Construction-Related Impacts

Traffic impacts due to construction activities for this alternative would be the same as the Fully Underground LRT Alternative – Little Tokyo Variation 1. However, this alternative also includes a proposed two-portal configuration on 1st Street east of Alameda Street. The construction of the eastbound portal would require the temporary closure of one eastbound and one westbound travel lane for extended time periods along 1st Street between Alameda and Vignes Streets. This would result in a reduction of roadway capacity and may potentially modify existing traffic flow patterns during construction activities. Travel times and intersection operations along this roadway segment would be impacted and delays would be expected to increase due to the potential for increased traffic congestion during peak periods.

However, the 1st Street Bridge is currently reduced to two lanes for an unrelated construction project, and lengthy delays do not frequently occur.

Construction activities and impacts to pedestrian and bicycle flow for this alternative would be the same as the Underground Emphasis LRT Alternative – Broadway Station Option west of Central Avenue and the same as the Fully Underground LRT Alternative – Little Tokyo Variation 1 for the proposed Alameda Street portal. Closure of the two travel lanes for extended time periods along 1st Street between Alameda and Vignes Streets would potentially impact the designated Class III bicycle route along 1st Street. The flow of bicycle traffic would be impacted due to the reduction of roadway capacity. The additional automobile traffic would result in increased turning movements, potentially reducing bicycle operating speeds or resulting in a greater risk of bicycle-automobile conflict, since Class III routes do not have bicycle-designated lanes.

The operational phase of the Fully Underground LRT Alternative – Little Tokyo Variation 2 would result in the restoration of the parking, pedestrian, bicycle, and auto facilities to their permanent configurations. Potential short term, adverse impacts are anticipated during construction of this alternative.

5.6.1.2 Indirect Impacts

Impacts from construction-related activities are temporary and direct in nature. No indirect impacts are anticipated for traffic circulation or parking under the Fully Underground LRT Alternative – Little Tokyo Variation 2.

5.6.1.3 Cumulative Impacts

Impacts to traffic circulation during construction would be short term. However, it would contribute to a potential cumulative adverse effect when added to other projects in the downtown area. Therefore, cumulative adverse traffic circulation impacts are anticipated for the Fully Underground LRT Alternative – Little Tokyo Variation 2.

5.6.2 Displacements and Relocation

5.6.2.1 Direct Impacts

Permanent Impacts During Construction Period

To construct the Fully Underground LRT Alternative – Little Tokyo Variation 2, up to five additional full takes, one fewer partial take, and two additional permanent underground easements than the Underground Emphasis LRT Alternative would be required. This includes two more partial takes along 1st Street than would be required for the Fully Underground LRT Alternative –Little Tokyo Variation 1. These properties would be utilized for construction staging, below grade tunneling operations, and station construction. The details of these potential impacts and associated candidate mitigation measures are presented in the Displacements and Relocation of Existing Uses Technical Memorandum.

Construction-Related Impacts

During construction of the Fully Underground LRT Alternative – Little Tokyo Variation 2, staging of construction equipment and materials would require temporary construction easements that would impact three fewer parcels than the Underground Emphasis LRT Alternative (five parcels in total). The portions of these parcels that would be utilized would be plazas and open areas. Access to businesses and existing buildings would be maintained. Some temporary sidewalk detours may be needed. Mitigation would minimize the potential adverse impacts associated with this type of displacement during construction. In addition, once construction is completed, the sites would be restored to their permanent configurations.

5.6.2.2 Indirect Impacts

Displacement impacts are direct in nature. Therefore, no indirect construction impacts associated with displacements or relocation are anticipated.

5.6.2.3 Cumulative Impacts

No cumulative adverse construction impacts associated with displacements or relocation are anticipated under the Fully Underground LRT Alternative – Little Tokyo Variation 2.

5.6.3 Community and Neighborhoods

5.6.3.1 Direct Impacts

Similar to the Underground Emphasis LRT Alternative, mobility would be reduced in the Bunker Hill and Little Tokyo areas due to street closures associated with construction activities, including track installation, cut and cover excavation, TBM deployment, structural support work. Disruption of traffic patterns would restrict access of residents and businesses, though to a lesser extent than the At-Grade Emphasis LRT Alternative. However, in Little Tokyo, there would be less disruption to traffic along Alameda and 1st Streets than the Underground Emphasis LRT Alternative because this alternative does not include the excavation and construction of the Alameda Street underpass and potential pedestrian bridge. Instead, the Fully Underground LRT Alternative – Little Tokyo Variation 2 includes an underground rail junction beneath the intersection of 1st and Alameda Streets, a portal near Temple and Alameda Streets, and two portals on 1st Street between Alameda and Vignes Streets. The installation of TBMs either at Little Tokyo or Bunker Hill would temporarily disrupt the communities, businesses, and residences, including Savoy and Honda Plaza in Little Tokyo and the Bunker Hill Towers. In addition the construction activity related to tunnel portal construction on 1st Street would extend about one half block further east. Without mitigation, potential adverse construction impacts associated with community and neighborhoods are anticipated under the Fully Underground LRT Alternative – Little Tokyo Variation 2.

5.6.3.2 Indirect Impacts

During utility relocation, mobility would be reduced in the Civic Center, Historic Core, and Little Tokyo areas. Disruption of traffic patterns would restrict access to residences and businesses, though to a lesser extent than the At-Grade Emphasis LRT Alternative and the Underground Emphasis LRT Alternative. This could impact the economic vitality of some businesses, particularly in Little Tokyo, where the community has expressed concern about construction activities. Prolonged disruption to businesses could affect the cohesion of some communities, including Little Tokyo. Without mitigation, potential adverse indirect construction impacts associated with community and neighborhoods are anticipated under the Fully Underground LRT Alternative – Little Tokyo Variation 2.

5.6.3.3 Cumulative Impacts

No cumulative adverse construction impacts associated with communities or neighborhoods are anticipated under the Fully Underground LRT Alternative – Little Tokyo Variation 2.

5.6.4 Visual Resources and Aesthetics

5.6.4.1 Direct Impacts

Views and Visual Character

During construction of the Fully Underground LRT Alternative – Little Tokyo Variation 2, roughly similar construction staging areas would be utilized as the Underground Emphasis LRT Alternative. Impacts associated with views and visual character would be similar to the Underground Emphasis LRT Alternative with one exception: There would be fewer visual impacts in the Little Tokyo because large construction equipment would no longer be required for the excavation and construction of the Alameda Street underpass and potential pedestrian bridge. However, the Fully Underground LRT Alternative – Little Tokyo Variation 2 would require construction of an underground junction beneath 1st and Alameda Streets, a portal near Temple and Alameda Streets, and two portals on 1st Street between Alameda and Vignes Streets.

Lighting

A large portion of the construction would be conducted beneath the surface. However, there is a portion that would be at-grade where the tracks emerging from the portals would link to the existing Metro Gold Line tracks. During surface construction activities, temporary lighting may be necessary for nighttime work, which is typically scheduled in order to minimize disruption to daytime traffic and for nighttime lighting for staging sites, primarily for security. However, nighttime construction activities would be limited to non-residential areas and nighttime illumination of staging areas would be directed towards the site and away from sensitive uses. Therefore, less-than-significant impacts are anticipated.

5.6.4.2 Indirect Impacts

No indirect adverse construction impacts associated with visual resources are anticipated under the Fully Underground LRT Alternative – Little Tokyo Variation 2.

5.6.4.3 Cumulative Impacts

No cumulative adverse construction impacts associated with visual resources are anticipated under the Fully Underground LRT Alternative – Little Tokyo Variation 2.

5.6.5 Air Quality

5.6.5.1 Direct Impacts

Regional Construction Emissions

Additional excavation for the two-level underground station at 2nd Street and Central Avenue as well as from the additional underground alignment along Alameda and 1st Streets would occur under the Fully Underground LRT Alternative – Little Tokyo Variation 2. This would require additional truck trips to dispose of excavated material. This would intensify the potential impacts to air quality beyond those identified for the Underground Emphasis LRT Alternative. An analysis of construction-related emissions was completed in accordance with SCAQMD requirements. The estimate included emissions from off-road construction equipment, fugitive dust, construction worker commuting, and haul trucks. Table 5-12 provides a summary of daily construction emissions anticipated during peak activities for the entire project area.

Table 5-12. Fully Underground LRT Alternative – Little Tokyo Variation 2 (2014-2017) Maximum Daily Regional Construction Emissions

Daily Emissions (pounds/day)						
Location	VOC	NOx	CO	SO_2	PM_{10}	$PM_{2.5}$
2nd/Hope Street station (SEM)						
Onsite	**367**	**2,596**	**1,474**	5	105	**95**
Offsite	10	102	72	<1	25	7
Total	**377**	**2,698**	**1,545**	5	131	**102**
2nd/Hope Street station (Open Cut)						
Onsite	**176**	**2,670**	**1,523**	5	109	**98**

Table 5-12. Fully Underground LRT Alternative – Little Tokyo Variation 2 (2014-2017) Maximum Daily Regional Construction Emissions

Daily Emissions (pounds/day)						
Location	VOC	NOx	CO	SO_2	PM_{10}	$PM_{2.5}$
Offsite	10	107	74	<1	26	7
Total	**386**	**2,777**	**1,597**	5	135	**105**
Threshold	75	100	550	150	150	55

*Note: Significant emissions are shown in **bold**.*
Source: CDM, Metro Regional Connector Air Quality Technical Memorandum, 2010.

Use of electric construction equipment could be encouraged where feasible. Daily regional construction emissions are anticipated to exceed SCAQMD regional significance thresholds for VOC, NO_X, CO, and $PM_{2.5}$, and would result in a potentially adverse effect without mitigation.

Localized Construction Emissions

In addition to evaluating emissions on a regional level, construction emissions were compared to SCAQMD's localized significance thresholds. The maximum localized construction emissions would occur during cut and cover construction along Flower Street, cut and cover construction of the Flower/5th/4th Street station, and construction of the 2nd Street/Broadway station. Construction of the Fully Underground LRT Alternative – Little Tokyo Variation 2 would result in maximum daily localized emissions of approximately 300 ppd of NO_X, 170 ppd of CO, 11 ppd of $PM_{2.5}$ and 13 ppd of PM_{10}. Daily construction emissions are anticipated to exceed SCAQMD localized significance thresholds for NO_X, and PM_{10}, and $PM_{2.5}$ and would result in a potentially adverse localized air quality construction effect.

5.6.5.2 Indirect Impacts

Construction of the Fully Underground LRT Alternative – Little Tokyo Variation 2 would result in indirect emissions of TACs. Emissions from the project were compared to existing conditions (2009) for CEQA. A summary of the results of the Tier 1 HRA are provided in Table 5-12. Since VOC emissions will decrease in future years because of the improvement in engine technology, the HRA was not conducted for VOC emissions. Instead, it was limited to inorganic emissions. The Fully Underground LRT Alternative – Little Tokyo Variation 2 would not cause significant emissions of TACs under CEQA.

5.6.5.3 Cumulative Impacts

Daily regional and localized construction emissions are anticipated to exceed SCAQMD regional significance thresholds and would result in a potentially adverse cumulative effect without mitigation.

5.6.6 Noise and Vibration

5.6.6.1 Direct Impacts

Anticipated construction equipment and the related noise levels would be the same as those shown in Table 5-8 for the Underground Emphasis LRT Alternative.

The construction of the additional underground alignment along Alameda and 1st Streets would result in new sources of temporary noise and vibration that would not be part of the Underground Emphasis LRT Alternative. These sources would result in the same levels of noise and vibration as those described for Underground Emphasis LRT Alternative.

Additional construction activity would occur closer to sensitive receptors along Alameda and 1st Streets. This would intensify the impacts from noise and vibration compared to those identified for the Underground Emphasis LRT Alternative. The construction activities with the greatest potential to cause noise impacts would be construction of the cut and cover tunnel along Flower Street, cut and cover construction of the Flower/5th/4th Street station, cut and cover construction of the approach to 2nd/Hope Street station, construction of the 2nd/Hope Street station, cut and cover construction of the 2nd Street /Broadway station, and open cut construction of the 2nd Street/Central Avenue station. These activities would have the greatest potential for noise impacts due to the duration of the work and the proximity of construction activities to noise sensitive land uses.

Under the Fully Underground LRT Alternative – Little Tokyo Variation 2, the no at-grade junction or underpass would be constructed on Alameda Street. This would remove a potential temporary noise source in the Little Tokyo community that would occur for a two to three year period under the At-Grade and Underground Emphasis LRT Alternatives. However, an underground junction beneath 1st and Alameda Streets, a portal near Temple and Alameda Streets, and two portals on 1st Street between Alameda and Vignes Streets would be constructed as part of this alternative. Potential adverse effects from construction noise are anticipated without the implementation of mitigation measures.

The potential for construction vibration to cause building damage and annoyance impacts would be the same as identified under the Fully Underground LRT Alternative – Little Tokyo Variation 1. Without the implementation of mitigation measures, vibration impacts would be potentially significant under the Fully Underground LRT Alternative – Little Tokyo Variation 2.

5.6.6.2 Indirect Impacts

Impacts from construction-related activities are temporary and direct in nature. No indirect impacts are anticipated from noise or vibration under the Fully Underground LRT Alternative – Little Tokyo Variation 2.

5.6.6.3 Cumulative Impacts

Impacts from noise and vibration during construction would be short term and would not contribute to a cumulative adverse effect. Therefore, no cumulative adverse noise or vibration impacts are anticipated under the Fully Underground LRT Alternative – Little Tokyo Variation 2.

5.6.7 Geotechnical/Subsurface/Seismic/Hazardous Materials

5.6.7.1 Direct Impacts

Geotechnical/Subsurface/Seismic

The Fully Underground LRT Alternative – Little Tokyo Variation 2 proposed alignment would not cross any known faults. However, portions of the Fully Underground LRT Alternative – Little Tokyo Variation 2 proposed alignment occur in areas mapped with the potential for liquefaction based on soil stability. Areas susceptible to liquefaction are along Flower Street between Wilshire Boulevard and 2nd Street, and along 2nd Street between Hill and San Pedro Streets. A portion of the alignment near Alameda and 1st Streets would be within the mapped Inundation Hazard Area. In addition, the proposed 2nd/Hope Street station would be within the Hillside Ordinance area (Bunker Hill).

Geotechnical, subsurface, and seismic impacts during construction of the Fully Underground LRT Alternative – Little Tokyo Variation 2 would be similar to those of the Underground Emphasis LRT Alternative during construction. Section 5.4.7.1 contains further analysis.

Hazardous Materials

Construction of the Fully Underground LRT Alternative – Little Tokyo Variation 2 would entail excavation along most of the proposed alignment, during which contaminated soil and groundwater could be encountered. Hazardous material impacts during construction of the Fully Underground LRT Alternative – Little Tokyo Variation 2 would be similar to those of the Underground Emphasis LRT Alternative during construction. Section 5.4.7.1 contains further analysis.

5.6.7.2 Indirect Impacts

No indirect adverse geotechnical, subsurface, seismic, or hazardous materials impacts are anticipated during construction of the Fully Underground LRT Alternative – Little Tokyo Variation 2.

Table 5-13. Fully Underground LRT Alternative – Little Tokyo Variation 2 (2014-2017) Toxic Air Contaminant Construction Emissions and HRA						
TAC	CAS #	Emissions (pounds/hr)		PSL	PSI	
		2nd/Hope Street SEM	2nd/Hope Street Open Cut	(lb/hr)	2nd/Hope Street SEM	2nd/Hope Street Open Cut
Arsenic	7440-38-2	2.38E-05	2.46E-05	1.00E-04	2.38E-01	2.46E-01
Chlorine	7782-50-5	1.88E-03	1.95E-03	1.05E-01	1.79E-02	1.86E-02
Copper	7440-50-8	1.21E-04	1.25E-04	5.00E-02	2.41E-03	2.50E-03
Mercury	7439-97-6	1.31E-04	1.35E-04	9.00E-04	1.46E-01	1.51E-01
Nickel	7440-02-0	8.90E-05	9.20E-05	3.00E-03	2.97E-02	3.07E-02
				ASI	4.29E-01	4.44E-01
				Threshold	1.0	

Notes:
ASI = application screening index (total PSI)
CAS = Chemical Abstracts Service
lb/hr = pounds per hour
PSI = pollutant screening index (PSL divided by project emissions)
PSL = pollutant screening level (minimum level expected to exceed health risk)
TAC = toxic air contaminant
Source: CDM, Metro Regional Connector Air Quality Technical Memorandum, 2010.

5.6.7.3 Cumulative Impacts

No cumulative adverse geotechnical, subsurface, seismic, or hazardous materials impacts are anticipated during construction of the Fully Underground LRT Alternative – Little Tokyo Variation 2.

5.6.8 Water Quality

5.6.8.1 Direct Impacts

Water quality impacts during construction of the Fully Underground LRT Alternative – Little Tokyo Variation 2 would be similar to those of the Underground Emphasis LRT Alternative during construction. Section 5.4.8.1 contains further analysis.

5.6.8.2 Indirect Impacts

No indirect adverse construction impacts associated with water quality are anticipated under the Fully Underground LRT Alternative – Little Tokyo Variation 2.

5.6.8.3 Cumulative Impacts

No cumulative adverse construction impacts associated with water quality are anticipated under the Fully Underground LRT Alternative – Little Tokyo Variation 2.

5.6.9 Energy

5.6.9.1 Direct Impacts

The highest indirect energy consumption would occur during site clearance and construction of guideways, stations, and support facilities. Construction of the Fully Underground LRT Alternative – Little Tokyo Variation 2 would result in a temporary energy demand of approximately 6,300 billion BTUs. This impact would be temporary, and the project would result in long-term, beneficial decreases in energy use in the region. LADWP is committed to increasing electricity generation from renewable energy sources and ensuring a reliable flow of electricity to users in its service area. Given the long-term, beneficial decreases in energy use associated with this alternative; potential construction-related impacts would not be significant.

5.6.9.2 Indirect Impacts

No indirect adverse construction impacts associated with energy are anticipated under the Fully Underground LRT Alternative – Little Tokyo Variation 2.

5.6.9.3 Cumulative Impacts

No cumulative adverse construction impacts associated with energy are anticipated under the Fully Underground LRT Alternative – Little Tokyo Variation 2.

5.6.10 Climate Change

5.6.10.1 Direct Impacts

No direct adverse construction impacts associated with climate change are anticipated under the Fully Underground LRT Alternative – Little Tokyo Variation 2.

5.6.10.2 Indirect Impacts

No indirect adverse construction impacts associated with climate change are anticipated under the Fully Underground LRT Alternative – Little Tokyo Variation 2.

5.6.10.3 Cumulative Impacts

The construction of the Fully Underground LRT Alternative – Little Tokyo Variation 2 would result in GHG emissions from diesel-fueled construction equipment. Emissions would be generated by onsite equipment, offsite worker vehicles, and offsite haul trucks. A total of approximately 117,600 metric tons per year of GHG emissions would be produced during all phases of construction under the Fully Underground LRT Alternative – Little Tokyo Variation 2.

The proposed project would result in a decrease in GHG emissions compared to the No Build Alternative and, due to regional growth unrelated to the project, an increase in GHG emissions compared to existing conditions (2009). This proposed alternative is consistent with CARB's Scoping Plan requirement to reduce GHG emissions. It is expected that other projects operating in 2035 would be consistent with the emission reduction targets of SB 375 and the Regional Transportation Plan. As a result, emissions would not be cumulatively significant.

5.6.11 Historic, Archaeological, and Paleontological Resources

5.6.11.1 Direct Impacts

The Fully Underground LRT Alternative – Little Tokyo Variation 2 would have the potential to alter, remove, or destroy archaeological and paleontological resources within the APE due to the creation of a new underground tunnel along its entire route and new underground stations. Potential archaeological and paleontological impacts during construction of the Fully Underground LRT Alternative – Little Tokyo Variation 2 would be similar to those of the Underground Emphasis LRT Alternative during construction. Section 5.4.11.1 contains further analysis.

5.6.11.2 Indirect Impacts

The construction of the Fully Underground LRT Alternative – Little Tokyo Variation 2 would have the potential to indirectly impact historical resources during cut and cover station and tunnel construction, portal construction, and TBM tunneling. The impacts would be indirect because the construction activities themselves would not damage historical properties, but vibration and possible subsidence of soils could potentially impact the historical integrity of buildings. Mitigation would minimize the potential adverse impacts.

5.6.11.3 Cumulative Impacts

No cumulative adverse construction impacts associated with historical, archaeological, or paleontological resources are anticipated under the Fully Underground LRT Alternative – Little Tokyo Variation 2.

5.6.12 Ecosystems and Biological Resources

5.6.12.1 Direct Impacts

During construction of the Fully Underground LRT Alternative – Little Tokyo Variation 2, some mature trees containing nesting located along the proposed alignment could be removed. As these mature trees may provide potential nesting and roosting habitat for bird species, including raptors, removal or disturbance of this vegetation during the nesting season could directly impact the habitat and any bird species that are present. As no mature trees or other biological resources were observed in the area north and east of 1st and Alameda Streets, there are no additional direct impacts related to the Fully Underground LRT Alternative – Little Tokyo Variation 2. The same mitigation measures described in Section 6 would be required to reduce these potential impacts to a less-than-significant level.

5.6.12.2 Indirect Impacts

As with the other build alternatives, indirect impacts to migratory birds from the Fully Underground LRT Alternative- Little Tokyo Variation 2 would not be significant because the project area provides only low quality habitat for a small number of migratory birds and only a small number of birds (if any) could be displaced. Mitigation taken to comply with the MBTA and the California Fish and Game Code would reduce these potential indirect impacts to a less-than-significant level.

5.6.12.3 Cumulative Impacts

No cumulative adverse construction impacts associated with ecosystems or biological resources are anticipated under the Fully Underground LRT Alternative – Little Tokyo Variation 2.

5.6.13 Parklands and Other Community Facilities

5.6.13.1 Direct Impacts

A large portion of the alignment of the Fully Underground LRT Alternative – Little Tokyo Variation 2 would be constructed underground using TBM tunneling, so access restrictions on 2nd Street would be limited to staging areas. However, there would be temporary road closures in the vicinity of cut and cover construction activities. Access to parking structure beneath Maguire Gardens and pedestrian access to the gardens would be temporarily restricted, as in the Underground Emphasis LRT Alternative. Locations along the alignment that could experience modified pedestrian and vehicle access during construction include the new LAPD headquarters, Caltrans, and the Little Tokyo Branch Public Library. Other community resources, particularly in Little Tokyo, such as MOCA, Go for Broke Monument, and JANM, would have fewer impacts associated with restricted access because the Fully Underground LRT Alternative – Little Tokyo Variation 2 does not include an underpass at Alameda Street at 1st Street, a pedestrian bridge, or surface track work at the Alameda Street/1st Street intersection. However, this alternative does include construction of an

underground junction beneath 1st and Alameda Streets, construction of a portal near Temple and Alameda Streets, and construction of two portals on 1st Street between Alameda and Vignes Streets. The portals on 1st Street will be closer to the Los Angeles Hompa Hongwanji Temple than any of the other alternatives, placing potential construction activities and impacts such as noise in greater proximity to the Temple. Response times for emergency services could also be impacted by this alternative, but to a lesser extent than the At-Grade Emphasis LRT Alternative on 2nd Street. Without mitigation, potential adverse construction impacts associated with parklands and other community facilities are anticipated under the Fully Underground LRT Alternative – Little Tokyo Variation 2.

5.6.13.2 Indirect Impacts

Although construction impacts are direct by nature, the construction of the Fully Underground LRT Alternative – Little Tokyo Variation 2 alignment could potentially discourage patrons of community facilities and parks due to restricted access and temporary parking restrictions. Mitigation could include signs, detour routes, and temporary replacement parking to encourage pedestrian and vehicular access to these community facilities. Without mitigation, potential adverse impacts are anticipated.

5.6.13.3 Cumulative Impacts

No cumulative adverse construction impacts associated with parklands and community facilities would be anticipated under the Fully Underground LRT Alternative – Little Tokyo Variation 2.

5.6.14 Economic Vitality and Employment Opportunities

5.6.14.1 Direct Impacts

The construction of the Fully Underground LRT Alternative – Little Tokyo Variation 2 would result in fewer potential adverse economic impacts in the project area than the Underground Emphasis LRT Alternative. Depending on the construction techniques used, there may be a need for phased street closure. However the economic effects of these closures would not be as severe as the At-Grade Emphasis LRT Alternative and Underground Emphasis LRT Alternative due to lack of significant at-grade track construction and an Alameda Street underpass and pedestrian bridge. This alternative would include an underground junction beneath 1st and Alameda Streets, a portal near Temple and Alameda Streets, and two portals on 1st Street between Alameda and Vignes Streets. The economic impacts caused by the Fully Underground LRT Alternative – Little Tokyo Variation 2 would be primarily limited to the station sites, and would be similar to the Underground Emphasis LRT Alternative.

Investment in transportation, including direct investment in the form of capital construction and operations costs, provides economic benefits through the creation of direct and indirect jobs and spending by suppliers whose goods and services are used in the project. These benefits are discussed in the Economic and Fiscal Impacts Technical Memorandum. The

benefits of the additional transit infrastructure in the long-term would outweigh the temporary significant impacts in the project area.

5.6.14.2 Indirect Impacts

As discussed in Section 5.6.3, construction of the Fully Underground LRT Alternative – Little Tokyo Variation 2 would result in the temporary closure of several streets. During utility relocation and lane closures, traffic would be diverted to surrounding streets. The traffic diversions and parking restrictions could potentially impact the economic viability of businesses adjacent to the closures, though to a lesser extent than the At-Grade Emphasis LRT Alternative. Although these potential construction impacts would short-term and intermittent, they would be considered potentially adverse without mitigation.

5.6.14.3 Cumulative Impacts

No cumulative adverse construction impacts associated with economic vitality are anticipated under the Fully Underground LRT Alternative – Little Tokyo Variation 2.

5.6.15 Safety and Security

5.6.15.1 Direct Impacts

The contractor will have a safety plan and be responsible for construction site security in conformance with local regulations and standards. Construction activities are not anticipated to affect security in the project area. Construction staging areas would typically be fenced off with restricted access and well lit. A large portion of the construction would occur underground, separated from pedestrians and vehicles. No direct adverse impacts associated with safety or security are anticipated under the Fully Underground LRT Alternative – Little Tokyo Variation 2.

5.6.15.2 Indirect Impacts

No indirect adverse construction impacts associated with safety or security are anticipated under the Fully Underground LRT Alternative – Little Tokyo Variation 2.

5.6.15.3 Cumulative Impacts

No cumulative adverse construction impacts associated with safety or security are anticipated under the Fully Underground LRT Alternative – Little Tokyo Variation 2.

6.0 POTENTIAL MITIGATION MEASURES

Construction impacts are typically short-term and temporary. The following potential mitigation measures would minimize the potential adverse impacts associated with construction that were identified in Section 5.

6.1 No Build Alternative

6.1.1 Direct Impacts

No direct adverse impacts associated with construction-related activities are anticipated under the No Build Alternative. Therefore, no mitigation measures would be required.

6.1.2 Indirect Impacts

No indirect adverse impacts associated with construction-related activities are anticipated under the No Build Alternative. Therefore, no mitigation measures would be required.

6.1.3 Cumulative Impacts

No cumulative adverse impacts associated with construction-related activities are anticipated under the No Build Alternative. Therefore, no mitigation measures would be required.

6.2 Transportation Systems Management (TSM) Alternative

6.2.1 Direct Impacts

No direct adverse impacts associated with construction-related activities are anticipated under the TSM Alternative. Therefore, no mitigation measures would be required.

6.2.2 Indirect Impacts

No indirect adverse impacts associated with construction-related activities are anticipated under the TSM Alternative. Therefore, no mitigation measures would be required.

6.2.3 Cumulative Impacts

No cumulative adverse impacts associated with construction-related activities are anticipated under the TSM Alternative. Therefore, no mitigation measures would be required.

6.3 At-Grade Emphasis LRT Alternative

6.3.1 Direct Impacts

6.3.1.1 Transportation, Circulation, and Parking

During the final design phase of the project, site and street specific Worksite Traffic Control Plans would be developed in cooperation with the LADOT to accommodate the required

traffic, pedestrian, and bicycle movements. To the extent practical, traffic lanes would be maintained in both directions, particularly during the morning and afternoon peak traffic hours. Access to adjacent businesses, via existing or temporary driveways, would be maintained throughout the construction period. In some cases, specific construction techniques may be utilized by the contractor to minimize construction envelopes. This could include the use of segmental construction, which would help minimize the need for extensive falsework on the ground. Apart from the proposed elimination of eastbound travel between Hill and Main Streets on 2nd Street, at least one traffic lane in each direction in addition to pedestrian access would be maintained during construction activities. Alternately, the construction contractor may elect to close 2nd Street entirely during construction between Figueroa and Los Angeles Streets. Designated haul routes for trucks would be identified during the final design phase of the project. These routes would be identified and located so as to minimize noise, vibration, and other possible impacts to adjacent businesses and neighborhoods. Following completion of the project, slight roadway restorations may be needed in areas that experienced frequent project-related truck trips.

A parking mitigation and circulation plan would be developed by the contractor in coordination with Metro and LADOT prior to construction to minimize impacts on curb parking. It may be possible to sequence construction activities so that multiple blocks of on-street parking are not temporarily removed simultaneously. This strategy would maximize the number on-street parking spaces available near the construction area. Some of the proposed parking mitigation measures associated with permanent parking displacements could be developed early so that they may be utilized during the construction. Metro may also lease parking lots for construction employees, if necessary.

After implementation of the proposed mitigation measures, construction-related traffic, parking, pedestrian, and bicycle impacts would still be considered potentially significant and unavoidable.

6.3.1.2 Displacements and Relocation

Where temporary construction easements are unavoidable, Metro would follow the provisions of the Uniform Act, as amended and implemented pursuant to the Uniform Relocation Assistance and Real Property Acquisition Regulations for Federal and Federally Assisted Programs adopted by the United States Department of Transportation (USDOT), dated February 3, 2005. Metro would apply acquisition and relocation policies to assure compliance with the Uniform Act and amendments. All real property acquired by Metro would be appraised to determine its fair market value. Just compensation, which would not be less than the approved appraisal made to each property owner, would be offered by Metro.

Potential adverse impacts associated with temporary construction easements are anticipated due to the construction and operation of the At-Grade Emphasis LRT Alternative. The following potential mitigation measures would result in no adverse impacts.

- Access to the Little Tokyo Library Branch would be maintained at all times during construction of the At-Grade Emphasis LRT Alternative.

- Adequate bus stop relocation and route detours would be implemented where bus stops would be displaced due to street closures. Adequate signage and noticing indicating the relocated bus stop would be placed at strategic locations, as determined by Metro Operations.

6.3.1.3 Community and Neighborhood Impacts

Potential adverse impacts associated with community and neighborhoods are anticipated due to construction of the At-Grade Emphasis LRT Alternative. Implementation of the following proposed mitigation measures would result in no adverse impacts.

- Whenever possible, detours would be developed for any roadways or sidewalks that must be closed during construction. Signs would be posted in appropriate languages to alert pedestrians and vehicles of any road or sidewalk detours. Pedestrian detours would be accessible to seniors and disabled persons.

- Early notification would be given to emergency service providers of any road closures or detours.

- A community outreach plan would be developed to notify local communities of construction schedules, road and sidewalk detours. Metro would coordinate with local communities during preparation of the traffic management plans to minimize potential construction impacts to community resources and special events. Efforts would be made to limit construction activities during special events when possible.

- Metro would develop a construction mitigation plan with community input to directly address specific construction impacts in the Little Tokyo community.

6.3.1.4 Visual Resources and Aesthetics

Implementation of the following mitigation measure would reduce the potential impacts to visual resources and aesthetics to a less than significant level.

- Construction staging areas outside of the public right-of-way (ROW) would be located adjacent to non-residential land uses to the maximum extent possible. In the event a building or site contains mixed land uses, with residential units above offices or retail, that site would be considered residential for staging purposes. If complete avoidance of adjacent residential properties is not possible, then construction staging would be screened from the residential land uses.

6.3.1.5 Air Quality

The effects of lane closures and intersection improvements during construction activities would reduce traffic speeds and result in increased emissions, particularly CO emissions, at major points of delay. Detour routes would ensure that traffic does not idle for extended periods of time, thus reducing the potential for localized exceedances of the federal CO standards. Construction-related air quality impacts would be temporary. With the implementation of mitigation measures, the potential adverse construction effects would still be significant and unavoidable.

- Water or a stabilizing agent would be applied to exposed surfaces in sufficient quantity to prevent generation of dust plumes.
- Track-out would not extend 25 feet or more from an active operation and track-out would be removed at the conclusion of each workday.
- Contractors would be required to utilize at least one of the measures set forth in South Coast Air Quality Management District Rule 403 section (d)(5) to remove bulk material from tires and vehicle undercarriages before vehicles exit the project site.
- All haul trucks hauling soil, sand, and other loose materials would maintain at least six inches of freeboard in accordance with California Vehicle Code Section 23114.
- All haul trucks hauling soil, sand, and other loose materials would be covered (e.g., with tarps or other enclosures that would reduce fugitive dust emissions).
- Traffic speeds on unpaved roads would be limited to 15 mph.
- Operations on unpaved surfaces would be suspended when winds exceed 25 mph.
- Heavy equipment operations would be suspended during first and second stage smog alerts.
- On-site stockpiles of debris, dirt, or rusty materials would be covered or watered at least two times per day.
- Contractors would use non-electric equipment and non-electric vehicle engines built in 2014 or later.
- Contractors would utilize electricity from power poles rather than temporary diesel or gasoline generators, as feasible.
- Heavy-duty trucks would be prohibited from idling in excess of five minutes, both on- and off-site.

- Construction parking would be configured to minimize traffic interference.
- Construction activity that affects traffic flow on the arterial system would be limited to off-peak hours, as feasible.

6.3.1.6 Noise and Vibration

Noise-control measures during construction would be required to minimize adverse effects on existing noise-sensitive land uses. All construction activities would have to comply with local noise ordinances and noise regulations. The measures listed in this section are examples of those that would be incorporated and should be re-evaluated in greater detail during preliminary design because adverse effects to residences cannot be accurately determined without detailed construction plans and schedules. During the construction phase of the project, sensitive and/or historic buildings within 21 feet of the construction may be susceptible to vibration damage. If survey of the structures finds buildings susceptible to vibration damage, a monitoring plan would be developed and committed to during project construction to ensure appropriate measures are taken to avoid any damage to historic buildings due to construction-induced vibration. These measures would also further reduce annoyance from ground borne vibration to sensitive land uses. General mitigation measures presented below are guidelines in developing measures to reduce construction noise and vibration. The measures would be incorporated into site-specific construction plans to minimize adverse noise effects to sensitive receivers along the project corridor. Equipment noise emission limits also would be developed and/or adopted from existing sources. Construction hours would be set, and construction activity noise level emission criteria would be determined and compliance required during construction. With the implementation of mitigation measures, no substantial adverse noise and vibration construction effects are anticipated.

- When possible, maintaining distances greater than those provided in Table 5-2 would help to avoid potential construction-related vibration damage.
- Where construction vibration may be problematic, Metro would use less vibration-intensive construction equipment or techniques near vibration-sensitive structures or operations to reduce the potential for damage or annoyance from ground borne vibration.
- Heavily laden vehicles would be routed away from vibration-sensitive locations.
- Earthmoving equipment would be routed as far away as possible from vibration-sensitive locations by site layout considerations. Metro would use chemical splitting or hydraulic jack splitting and drilled soldier piles would be used instead of high impact methods.

- Construction activities that produce vibration such as demolition, excavation, earthmoving, and ground impacting would be sequenced such that the vibration sources operate separately and not simultaneously.
- Nighttime construction activities that produce noticeable vibration would be avoided because people are more likely to be home and more sensitive to vibration at night.
- The smallest vibration-producing device possible to accomplish necessary tasks while minimizing excess vibration would be used.
- Non-impact demolition and construction methods would be selected, such as saw or torch cutting and removal for off-site demolition; chemical splitting or hydraulic jack splitting would be used instead of high impact methods.
- Use of pavement breakers and vibratory rollers and packers would be avoided near sensitive uses.
- Temporary sound wall and noise blankets would be installed at off-street construction staging sites where activity on the site will be continuous such as the TBM launch and excavation sites, the station sites. These walls would be decorated with local artistry and maintained regularly.

6.3.1.7 Geotechnical/Subsurface/Seismic/Hazardous Materials

Implementation of the proposed mitigation measures and plans would result in no adverse geotechnical, subsurface, seismic, or hazardous materials impacts during construction.

- Design criteria would be established during project design that requires the construction contractor to limit movement to less than an acceptable threshold value as a performance standard. This acceptable threshold standard would be a function of several factors including but not limited to the type of structure and its existing condition. Additional data and survey information would be gathered during preliminary engineering for each building to enable assessment of the tolerance of the subject structures. In addition, standard threshold criteria and guidelines published by agencies and for similar type of structures would be reviewed. Additional geotechnical studies would be performed to define the nature of the soils and to refine the means of achieving the performance specification.
- Ground improvement such as grouting or other methods to fill voids where appropriate and offset potential settlement when excess material has been removed during excavation would be required. The criteria for requiring grouting or ground improvement would be based on the additional data collection and reviews as noted above and the acceptable threshold value.

- The tunnel alignment would be grouted in advance to provide adequate soil support and minimize settlement as geotechnical conditions require.
- Settlement would be monitored along project alignment using a series of measuring devices above the route of the alignment. Leveling surveys would be conducted prior to tunneling, to monitor for possible ground movements.
- A preconstruction survey of buildings would be conducted to establish a baseline for measuring potential construction-induced damage.
- Tunnel construction monitoring requirements would be described and defined. In addition, provisions could be included to use the Earth Pressure Balance or Slurry TBM for tunnel construction to minimize ground loss. During tunnel construction, the soils encountered would be monitored relative to anticipated soil conditions as described in a Geotechnical Report.

A Contaminated Soil/Groundwater Management Plan would be implemented during construction to establish procedures to follow if contamination is encountered. The Plan would be prepared during the Final Design phase of the project, and the construction contractor would be held to the level of performance specified in the Plan. The Plan would include the following:

- Notification procedures and contact information for appropriate regulatory agencies;
- Procedures for sampling and analysis of soil and/or groundwater known or suspected to be impacted by hazardous materials;
- Procedures for the proper handling, storage, transport, and disposal of contaminated soil and/or groundwater, in consultation with regulatory agencies;
- Dust control measures (e.g., soil wetting, wind screens, etc.) for contaminated soil;
- Groundwater collection, treatment and discharge procedures and applicable standards.

A Worker Health and Safety Plan would be implemented prior to the start of construction activities. All workers would be required to review the plan, receive training if necessary, and sign the plan prior to starting work. The plan would, at a minimum, identify the following:

- Properties of concern and the nature and extent of contaminants that could be encountered during excavation activities;

- All appropriate worker, public health, and environmental protection equipment and procedures;
- Emergency response procedures, including most direct route to a hospital; and
- The Site Safety Officer.

During construction of the underground portions of the At-Grade Emphasis LRT Alternative mitigation would be required to address the potential for the creation of a preferential pathway and resulting spread of existing groundwater contamination. This could entail the use of impermeable grout where necessary to fill the gap between the tunnel and the surrounding earth along underground portions of the alignment where groundwater contamination exists.

To reduce potential impacts from subsurface gases associated with oilfields in the vicinity of the project area, mitigation measures would be implemented during construction of the underground portions of the At-Grade Emphasis LRT Alternative to address both exposure to toxic gases and the risk of explosion. This would be particularly important in methane zones and methane buffer zones, but testing would be required in all underground segments, as oilfield gases could occur outside of mapped zones. Specific precautions to protect workers and the public from exposure to toxic gases would be required, and specialized excavation methods would be needed to prevent explosion. Prior to building demolition, surveys of asbestos containing materials and lead-based paint would be conducted. If necessary, destructive sampling would be used. All asbestos containing materials and lead-based paint would be removed or otherwise abated prior to demolition. Removal and abatement activities would comply with all applicable laws, regulations, and rules.

6.3.1.8 Water Resources

If contaminated groundwater is encountered during initial drilling and water quality testing prior to construction, and it is determined that there is potential for the contamination to spread, this would be mitigated during the design and engineering process. For example, it could be specified that impermeable concrete-based grouting materials be used to fill the gap between the tunnel and the surrounding earth. The permeability of grouting materials is lower than surrounding soil types and this would reduce the possibility that the tunnel could serve as a preferential pathway for contaminant migration. Additional best management practices (BMPs) that would address potential impacts from encountering contaminated groundwater and groundwater dewatering activities are proposed in the Geotechnical/Subsurface/Seismic/Hazardous Materials Technical Memorandum.

Additional potential construction mitigation measures could include:

- Establishment of an erosion control plan prior to the initiation of construction activities. The erosion control plan would include:
  - Use of natural drainage, detention ponds, sediment ponds, or infiltration pits to allow runoff to collect and reduce or prevent erosion;
  - Use of barriers to direct and slow the rate of runoff and to filter out large-sized sediments;
  - Use of down-drains or chutes to carry runoff from the top of a slope to the bottom; and,
  - Control of water use for irrigation and dust control so as to avoid off-site runoff.

Potentially significant impacts to water quality stemming from construction of the Regional Connector project could be mitigated with the following measures as appropriate;

- Project design that includes properly designed and maintained biological oil and grease removal systems in new storm drain systems to treat water before it leaves project sites;
- Proper storage of hazardous materials to prevent contact with precipitation and runoff;
- Development and maintenance of an effective monitoring and cleanup program for spills and leaks of hazardous materials;
- Placement of equipment to be repaired or maintained in covered areas on a pad of absorbent material to contain leaks, spills, or small discharges;
- Periodic and consistent removal of landscape and construction debris;
- Removal of any significant chemical residue on the project sites through appropriate methods;
- Use of non-toxic alternatives for any necessary applications of herbicides or fertilizers;
- Installation of detention basins to remove suspended solids by settlement; and/or,
- Periodic monitoring of the water quality of runoff before discharge from the site and into the storm drainage system.

6.3.1.9 Cultural/Archeological Resources

Historic Resources

- MM-BE-1 Historic Properties/Historical Resources Documentation. Documentation of historic properties and historical resources adversely affected by the project would consist of the development of individual Historic American Building Survey/Historic American Engineering Record (HABS/HAER) submissions. The HABS/HAER documents would be prepared so that the original archival-quality documentation could be donated for inclusion in the Library of Congress if the National Park Service accepts these materials. Archival copies of the documentation would also be offered for donation to local repositories, including the Los Angeles Central Library and the Los Angeles Conservancy. The appropriate level of recordation would be established in consultation with the California SHPO and formalized as a part of MM-BE-5.

- MM-BE-2 Pre-Construction Baseline Survey And Geo-Technical Investigations. A survey of historic properties and/or historical resources within 21 feet of vibration producing construction activity would be conducted to assess the building category and the potential for GBV to cause damage. The survey would also be used to establish baseline, preconstruction conditions for historic properties and historical resources. During preliminary and final design of the project, subsurface (geotechnical) investigations would be undertaken under this measure to evaluate soil, groundwater, seismic, and environmental conditions along the alignment. This analysis would assist in the development of appropriate support mechanisms for cut and fill construction areas. The subsurface investigation would also identify areas that could experience differential settlement as a result of using a tunnel boring machine in close proximity to historic properties and/or historical resources. An architectural historian or historical architect who meets the Secretary of the Interior's Professional Qualification Standards would provide input and review of final design documents prior to implementation of measures (36 CFR Part 61).

- MM-BE-3 Building Protection Measures, Geotechnical and Vibration Monitoring, and Post Construction Survey. For those historic properties and historical resources that have the potential to be affected or impacted by ground borne vibrations and/or differential settlement, Metro would use building protection measures such as underpinning, soil grouting, or other forms of ground improvement, as well as lower vibration equipment an/or construction techniques. These techniques, combined with a geotechnical and vibration monitoring program, would help protect identified historic properties and historical resources. The historic property and historical resource protection measures as well as the geotechnical and vibration monitoring program would be reviewed by an architectural historian or historical architect who meets the Secretary of the Interior's Professional Qualification Standards (36 CFR Part 61) to ensure that the measures would adequately protect the properties/resources. A

post construction survey would also be undertaken to ensure that no adverse effects or significant impacts had occurred to historic properties and historical resources.

- MM-BE-4 TBM Specifications/Requirements Near Historic Properties And Historical Resources. For those historic properties and historical resources that have the potential to be affected or impacted by differential settlement caused by TBM construction, a contractor would be required to develop and use an earth pressure balance or slurry shield tunnel boring machine. The method of machine operation would be based on the anticipated ground conditions near historic properties and historical resources. These construction methods and machinery types would reduce the potential for differential settlement near historic properties and historical resources.

- MM-BE-5 Memorandum of Agreement. For those historic properties and historical resources that would be anticipated to experience adverse effects, a memorandum of agreement would be developed to resolve those adverse effects consistent with 36 CFR 800. This agreement, developed by FTA and Metro in consultation with the CA SHPO and other consulting parties would resolve and/or avoid, minimize, or mitigate potential effects to historic properties and/or historical resources. The agreement would include stipulations that outline the specific requirements for consultation and decision making between the lead federal agency and consulting parties, specify the level of HABS/HAER recordation, outline specific requirements for pre- and post-construction surveys, geotechnical investigations, building protection measures, and TBM specifications.

Archaeological Resources

The Regional Connector Transit Corridor project may impact one or more National Register- or California Register-eligible archeological sites, including the Los Angeles zanja system (the Zanja Madre, CA-LAN-887H, and numerous unrecorded numbered zanjas) and sites CA-LAN-3588, P-19-003338, and P-19-003339, along with an unknown number of previously unidentified archeological resources.

Construction-related impacts to potentially significant archeological sites would be avoided by project design where possible. Zanja segments have been encountered in the project vicinity as shallow as 0.45 m (1.5 feet) below current grade (Zanja 6-1; P-19-003352) and as deep as 3.0 m (9.8 feet) below grade (Zanja Madre [CA-LAN-887H]; Slawson 2006). The use of deep-tunneling construction techniques, as opposed to cut and cover methods, for the underground portions of the proposed alignments may avoid impacts to this resource, although vibration effects caused by tunneling machinery must be taken into account as well. Site CA-LAN-3588 occupies a portion of the city block currently bounded by Alameda, Temple, Vignes, and 1st Streets. Sites P-19-003338 and P-19-003339 are located on 1st Street between Hewitt and Garey Streets. The avoidance of ground-disturbing construction activities within

these areas may circumvent impacts to these resources. In the event that resource avoidance is not possible, and to mitigate impacts to previously unidentified archeological resources, the following mitigation measures could be implemented.

Treatment of Undiscovered Archeological Resources

A detailed Cultural Resources Monitoring and Mitigation Plan (CRMMP) would be prepared prior to implementation of this project, similar in scope to the CRMMP that was prepared for Metro Gold Line to East Los Angeles (Glenn and Gust 2004). Implementation of a CRMMP during ground disturbance in highly sensitive archeological areas would ensure that cultural resources are identified and adequately protected. If cultural resources are discovered or if previously identified resources are affected in an unanticipated manner, the Monitoring Plan would also ensure that such resources receive mitigation to reduce the impact to less than significant levels. This plan would include, but not be limited to, the following elements, which are described briefly in the Archeological Technical Memorandum:

- Worker training
- Archeological monitoring
- Scientific evaluation and mitigation of archeological discoveries
- Native American participation, as needed
- Appropriate treatment of human remains, if applicable
- Reporting of monitoring and mitigation results

Treatment of Known Archeological Resources

The destruction of a resource that is eligible for listing in the National Register or California Register would be a significant adverse effect. This effect may be resolved through the implementation of a Memorandum of Agreement (MOA) between FTA, Metro, and the SHPO, as well as other interested parties. For the purposes of this report, four archeological sites that are either within or immediately adjacent to the direct APE are presumed eligible for listing on both the National Register and the California Register. These include the Los Angeles zanja system (the Zanja Madre, CA-LAN-887H, and numerous unrecorded numbered zanjas) and sites CA-LAN-3588, P-19-003338, and P-19-003339.

Effects to the data potential of archeological sites can be mitigated to a less than significant level through the preparation and implementation of a data recovery plan under Section 106 and CEQA. The actual measures agreed upon in the MOA may vary in substance and degree, but the MOA would include a process to resolve any adverse effects upon archeological resources within the direct APE that are eligible for listing in the National Register or

California Register. The treatment of sites CA-LAN-3588, P-19-003338, and P-19-003339 may include systematic and scientific exposure, evaluation, and if necessary, archeological data recovery.

Los Angeles Zanja System

The Los Angeles Zanja system was an extensive and integrated water conveyance network that served large areas of the city for multiple generations. Generally speaking, previous construction projects in downtown Los Angeles have unexpectedly encountered and documented limited exposures of a single zanja segment, often after the segment has been damaged by construction equipment. This incomplete approach does not permit the evaluation of the overall zanja system, given the requirements that the OHP clarified in their recent letter (Toffelmier 2009). It is likely that other projects (such as emergency utility repair) have damaged segments of the zanja system without documentation. This repeated damage (both monitored and unmonitored construction impacts) constitutes a cumulative effect/impact that should be mitigated. Construction monitoring alone is insufficient mitigation to address this effect/impact, particularly given the likelihood of damaging the zanjas prior to discovery during project construction process. Project-related inadvertent damage to the zanjas may constitute an adverse effect under the Criteria of Adverse Effect, "physical destruction or damage" (36 CFR Part 800.5(a) (2) and material impairment as defined in CEQA. This action would contribute to, rather than mitigate, these cumulative effects/impacts.

Both Section 106 of the National Historic Preservation Act (as amended) and the California Environmental Quality Act require the identification, documentation, and evaluation of historic properties/historic resources in a project area (or direct Area of Potential Effects, APE). For a poorly mapped and buried linear resource like the zanja system, identification alone is challenging. Rather than a costly archeological excavation program or a remote sensing (ground penetrating radar, etc.) survey that is unlikely to produce clear-cut results, we recommend a proactive identification and documentation program that would facilitate preservation or mitigation in a cost-effective manner. Using additional documentary research to identify, as accurately as possible, the precise alignments of the zanjas within the APE would facilitate mitigation. Where these alignments are expected to be affected by the proposed project, a limited archeological investigation (e.g., mechanical trenching at the direction of a qualified archaeologist) immediately preceding project construction would be an efficient and economical method to identify intact zanja segments.

The documentation and evaluation of the Los Angeles Zanja system would be best accomplished with a system-wide approach that incorporates historical, archeological, and engineering research and documentation. This systemic approach to documentation and evaluation is a particularly appropriate mitigation measure for the Regional Connector Transit Corridor project, which has the potential to impact multiple zanja segments. The documentation of the zanja segments' alignments and slopes would have the added benefit

of enabling future projects to more accurately predict the location of zanja segments outside of the project area.

To mitigate potential impacts to the Los Angeles Zanja system, the project MOA would provide that the system be adequately documented under the direction of an experienced archaeologist and an experienced historical architect, architectural historian, or historian, both meeting the Secretary of the Interior's qualification standards. This documentation would include a combination of historical research, archeological testing, and architectural documentation, and would be followed by a formal evaluation of National Register and California Register eligibility. It is important to note that substantial documentation already exists for the zanja system in the form of maps and engineering records, published books and articles, unpublished technical reports, and site records. The collation of available data for the system as a whole would accomplish much of the documentation effort that is advocated here, while intensive, original research would be restricted to the zanja segments that cross the direct APE.

Such research and documentation may include such specific measures as:

- Historical research using historical maps, photographs, and other written sources to document the creation, maintenance, modification, and abandonment of the system.
- Archeological research to establish the physical condition, presence of associated features and artifacts, and precise location of each zanja segment within the project's direct APE through the use of physical exposure through controlled excavation and/or remote sensing. Resources would be documented using California Department of Parks and Recreation (DPR) series 523 primary and detail forms, maps, and photographs. The results would be presented in a detailed technical report following Archeological Resource Management Report (OHP 1990) guidelines that addresses research questions and assesses the National Register and California Register eligibility of the system.
- Architectural documentation of exposed zanja segments through the production of narrative records, measured drawings, and photographs in conformance with Historic American Engineering Record (HAER) standards prior to any alteration or demolition activity.
- Preserving the results of the historical, archeological, and historic architectural studies in repositories such as the local main library branch, the lead agency headquarters library, and with identified non-profit historic groups interested in the subject matter.
- Interpreting the Los Angeles zanja system for the public through signage along the project alignment, visual representations of zanja alignments using colored pavement, or other appropriate means such as a dedicated internet website.

6.3.1.10 Paleontological Resources

The following mitigation measures have been developed in accordance with the SVP (1995) standards and guidelines and meet the paleontological requirements of CEQA. These mitigation measures have been used throughout California and have been demonstrated to be successful in protecting paleontological resources while allowing timely completion of construction.

- MM-P-1. A qualified paleontologist would produce a Paleontological Monitoring and Mitigation Plan for the proposed project and supervise monitoring of construction excavations. Paleontological resource monitoring would include inspection of exposed rock units during active excavations within sensitive geologic sediments. The monitor would have authority to temporarily divert grading away from exposed fossils to professionally and efficiently recover the fossil specimens and collect associated data.

- MM-P-2. All project-related ground disturbances that could potentially affect the Puente Formation, Fernando Formation, and Quaternary older alluvium and terrace deposits would be monitored by a qualified paleontological monitor on a full-time basis (where feasible) because these geologic sediments are determined to have a high paleontological sensitivity (Figure 4-3). Very shallow surficial excavations (less than 5 feet) within Quaternary younger alluvium would be monitored on a part-time basis to ensure that underlying sensitive units are not adversely affected (Figure 4-3). Construction monitoring during any tunneling activity is not warranted as any potential fossil specimens present within sensitive geologic units would be crushed and destroyed by the nature of tunneling methodology.

- MM-P-3. At each fossil locality, field data forms would be used to record pertinent geologic data, stratigraphic sections would be measured, and appropriate sediment samples would be collected and submitted for analysis.

- MM-P-4. Due to the likelihood of the presence of microfossils, matrix samples would be collected and tested within the Puente Formation and Fernando Formation. Testing for microfossils would consist of screen-washing samples (approximately 30 pounds) to determine if significant fossils are present. Productive tests would result in screen-washing of additional bulk matrix up to a maximum of 2,000 pounds per locality to ensure recovery of a scientifically significant sample.

- MM-P-5. Recovered fossils would be prepared to the point of curation, identified by qualified experts, listed in a database to facilitate analysis, and reposited in a designated paleontological curation facility (such as the Natural History Museum of Los Angeles County).

- MM-P-6. The paleontologist would prepare a final monitoring and mitigation report to be filed, at a minimum with Metro and the repository.

6.3.1.11 Ecosystems and Biological Resources

Federal and state migratory bird protection would require mitigation measures to address potential impacts to nesting bird species from the potential disturbance of trees within the proposed build alternative alignments. Trees that could potentially be disturbed include a portion of the approximately 250 trees located within the proposed alignment and station footprints for the At-Grade Emphasis LRT Alternative. The following potential mitigation measures would apply to all of the proposed build alternatives.

The first potential mitigation would be to avoid tree disturbances as much as possible. As project design progresses, it may be possible to reduce the number of trees potentially disturbed by avoidance or fencing. It may also be possible to reduce the scale of disturbance by trimming individual trees instead of removing them completely.

The second potential mitigation would be to time necessary tree removal and trimming activities to seasons outside of the bird breeding season, which can extend from February 1 to August 31. If it is not feasible to avoid tree removal and trimming related to construction during the breeding bird season from February 1 to August 31, breeding bird surveys would be conducted as recommended by the California Department of Fish and Game. Two biological surveys would be conducted, one 15 days and a second 72 hours prior to construction activities that would remove or disturb suitable nesting habitat. The surveys would be performed by a biologist with experience conducting breeding bird surveys. The biologist would prepare survey reports documenting the presence or absence of active nests of any protected native bird in the habitat to be removed and any other such habitat within 300 feet of the construction work area (or within 500 feet for raptors). If an active nest is located, construction within 300 feet of the nest (or 500 feet for raptor nests) would be postponed until the nest is vacated, juveniles have fledged, and there is no evidence of a second attempt at nesting.

If construction of the project requires removing any of the native trees located along the proposed alignment and stations for any of the build, a removal permit would be required from the Los Angeles Board of Public Works in accordance with the City of Los Angeles Native Tree Protection Ordinance. The tree removal permit may require replanting of native trees within the project area or at another location within the City of Los Angeles to mitigate for the removal of these trees. The City's ordinance requires replacement of protected trees at a 2:1 ratio and other trees at a 1:1 ratio. If construction would require pruning of any protected native tree, the pruning would be performed in a manner that does not cause permanent damage or adversely affect the health of the trees.

6.3.1.12 Parklands, Community Facilities, and Section 4(f)

Metro would prepare a traffic management plan to facilitate the flow of traffic in and around the construction zone and reduce restrictions to the access of public services along the alignment to the greatest extent feasible. This traffic management plan would include the following measures:

- Scheduling a majority of construction-related travel (i.e., deliveries, hauling, and worker trips) during the off-peak hours;
- Developing detour routes to facilitate traffic movement through construction zones without significantly increasing cut-through traffic in adjacent residential areas;
- Where feasible, temporarily re-striping roadway to maximize the vehicular capacity at those locations affected by construction closures;
- Where feasible, temporarily removing on-street parking to maximize the vehicular capacity at those locations affected by construction closures;
- Where feasible, stationing traffic control officers at major intersections during peak hours to minimize delays related to construction activities;
- Developing and implementing an outreach program to inform the general public about the construction process and planned roadway closures;
- Developing and implementing a program with business owners to minimize impacts to businesses during construction activity, including but not limited to signage programs.

6.3.1.13 Economic and Fiscal

Potential mitigation measures would apply to construction-related effects to minimize the economic construction effects of the proposed project. With implementation of the following mitigation measures no adverse economic effects would occur during construction.

- Compensation to property owners for acquisition of property in compliance with the Uniform Relocation Assistance and Real Property Acquisition Policies Act of 1970.
- Relocation assistance offered affected property and business owners in compliance with the California Relocation Act
- Measures to assist business owners significantly impacted by temporary construction activity (temporary parking, marketing programs, and other measures to be identified by Metro working with the appropriate businesses).

- Replacement parking locations and strategies (Metro is committed to implementing a feasible parking mitigation plan that would reduce parking impacts to a less than significant level).

6.3.1.14 Safety and Security

The following potential mitigation measures would apply to construction-related effects to minimize the construction effects of the proposed project.

- Providing alternate walkways for pedestrians around construction staging sites in accordance with American with Disability Act (ADA) requirements.
- Signing and properly marking all pedestrian detour locations around staging sites in accordance with the Manual on Uniform Traffic Control Devices "work zone" guidance, and other applicable local and state requirements.
- Coordinating work plans and traffic control measures with emergency responders to prevent effects to emergency response times.
- Metro would develop a Construction Mitigation Program during final design and implement during construction. The Program would guide Metro in communicating to the community and obtaining input from residents and businesses affected during construction. This would include communicating traffic control measures, schedule of activities and duration of operations.

6.3.2 Indirect Impacts

6.3.2.1 Community and Neighborhood Impacts

The mitigation measures in Section 6.3.1.3 would address potential indirect community and neighborhood construction impacts. Implementation of these proposed mitigation measures would result in no indirect adverse impacts from the proposed alternative.

6.3.2.2 Geotechnical/Subsurface/Seismic/Hazardous Materials

During construction of the At-Grade Emphasis LRT Alternative, gaps between the tunnel and the surrounding earth could serve as preferential pathways for the migration of groundwater contamination. Specifications for impermeable grouting materials to fill the gap between the tunnel and the surrounding earth would be designed to reduce this potential impact.

- During construction of the underground portion of the At-Grade Emphasis LRT Alternative, mitigation would be required to address the potential for the creation of a preferential pathway and resulting spread of existing groundwater contamination. This could entail the use of impermeable grout where necessary to fill the gap between the

tunnel and the surrounding earth along underground portions of the alignment where groundwater contamination exists.

6.3.3 Cumulative Impacts

6.3.3.1 Traffic Circulation and Parking

The mitigation measures in Section 6.3.1.1 would address potential cumulative traffic circulation and parking construction impacts. After implementation of these proposed mitigation measures, a potential significant and unavoidable traffic circulation impact would remain during construction of the At-Grade Emphasis LRT Alternative.

6.3.3.2 Air Quality

The mitigation measures in Section 6.3.1.5 would address potential cumulative air quality construction impacts. After implementation of these proposed mitigation measures, a potential significant and unavoidable construction air quality impact would remain under the At-Grade Emphasis LRT Alternative.

6.4 Underground Emphasis LRT Alternative

6.4.1 Direct Impacts

6.4.1.1 Traffic Circulation and Parking

Refer to mitigation measures in Section 6.3.1.1. After implementation of these proposed mitigation measures, a potential significant and unavoidable traffic circulation impact would remain during construction of the Underground Emphasis LRT Alternative.

6.4.1.2 Displacements and Relocation

Refer to mitigation measures in Section 6.3.1.2. After implementation of these proposed mitigation measures, a potential less-than-significant impact from displacements and relocation would occur during construction of the Underground Emphasis LRT Alternative.

6.4.1.3 Community and Neighborhood Impacts

Refer to mitigation measures in Section 6.3.1.3. After implementation of these proposed mitigation measures, a potential less-than-significant community and neighborhood impact would occur during construction of the Underground Emphasis LRT Alternative.

6.4.1.4 Visual Resources and Aesthetics

Refer to mitigation measures in Section 6.3.1.4. After implementation of these proposed mitigation measures, a less-than-significant impact to visual resources and aesthetics would occur during construction of the Underground Emphasis LRT Alternative.

6.4.1.5 Air Quality

Refer to mitigation measures in Section 6.3.1.5. After implementation of these proposed mitigation measures, a potential significant and unavoidable construction air quality impact would occur under the Underground Emphasis LRT Alternative.

6.4.1.6 Noise and Vibration

Refer to mitigation measures in Section 6.3.1.6. After implementation of these proposed mitigation measures, a potential less-than-significant impact to noise and vibration would occur during construction of the Underground Emphasis LRT Alternative.

6.4.1.7 Geotechnical/Subsurface/Seismic/Hazardous Materials

Refer to mitigation measures in Section 6.3.1.7. After implementation of these proposed mitigation measures, a potential less-than-significant geotechnical, subsurface, seismic, and hazardous materials impact would occur during construction of the Underground Emphasis LRT Alternative.

6.4.1.8 Water Resources

Refer to mitigation measures in Section 6.3.1.8. After implementation of these proposed mitigation measures, a potential less-than-significant impact to water resources would occur during construction of the Underground Emphasis LRT Alternative.

6.4.1.9 Cultural/Archeological

Refer to mitigation measures in Section 6.3.1.9. After implementation of these proposed mitigation measures, a potential less-than-significant impact to cultural/archeological resources would occur during construction of the Underground Emphasis LRT Alternative.

6.4.1.10 Paleontological Resources

Refer to mitigation measures in Section 6.3.1.10. Mitigation measures would not be feasible in areas where tunnels would be constructed using TBMs. Potential impacts in these areas would be unavoidable. Despite implementation of proposed mitigation measures where possible, potentially significant impacts to paleontological resources could occur during construction of the Underground Emphasis LRT Alternative.

6.4.1.11 Ecosystems and Biological Resources

Refer to mitigation measures in Section 6.3.1.11. After implementation of these proposed mitigation measures, a potential less-than-significant impact to ecosystems and biological resources would occur during construction of the Underground Emphasis LRT Alternative.

6.4.1.12 Parklands, Community Facilities, and Section 4(f)

Refer to mitigation measures in Section 6.3.1.12. After implementation of these proposed mitigation measures, a potential less-than-significant impact to parklands, community facilities, and Section 4(f) resources would occur during construction of the Underground Emphasis LRT Alternative.

6.4.1.13 Economic and Fiscal

Refer to mitigation measures in Section 6.3.1.13. After implementation of these proposed mitigation measures, a potential less than significant economic and fiscal impact would occur during construction of the Underground Emphasis LRT Alternative.

6.4.1.14 Safety and Security

Refer to mitigation measures in Section 6.3.1.14. After implementation of these proposed mitigation measures, a potential less-than-significant impact to safety and security would occur during construction of the Underground Emphasis LRT Alternative.

6.4.2 Indirect Impacts

6.4.2.1 Community and Neighborhood Impacts

Refer to Section 6.3.1.3 for mitigation measures regarding community and neighborhood impacts. Implementation of these proposed mitigation measures would result in no indirect adverse construction impacts.

6.4.2.2 Geotechnical/Subsurface/Seismic/Hazardous Materials

Refer to Section 6.3.1.7 for mitigation measures regarding community and neighborhood impacts. Implementation of these proposed mitigation measures would result in no indirect adverse construction impacts.

6.4.3 Cumulative Impacts

6.4.3.1 Traffic Circulation and Parking

Refer to mitigation measures in Section 6.3.1.1. After implementation of these proposed mitigation measures, a potential significant and unavoidable traffic circulation impact would remain during construction of the Underground Emphasis LRT Alternative.

6.4.3.2 Air Quality

Refer to mitigation measures in Section 6.3.1.5. After implementation of these proposed mitigation measures, a potential significant and unavoidable construction air quality impact would remain under the Underground Emphasis LRT Alternative.

6.5 Fully Underground LRT Alternative – Little Tokyo Variation 1

6.5.1 Direct Impacts

6.5.1.1 Traffic Circulation and Parking

Potential adverse impacts associated with traffic circulation are anticipated during the construction of the Fully Underground LRT Alternative – Variation 1. Refer to Section 6.3.1.1 for mitigation measures regarding traffic circulation impacts. After implementation of these proposed mitigation measures, a potential significant and unavoidable adverse impact would remain during construction of the Fully Underground LRT Alternative – Variation 1.

6.5.1.2 Displacements and Relocation

Refer to mitigation measures in Section 6.3.1.2. After implementation of these proposed mitigation measures, a potential less-than-significant impact from displacements and relocation would occur during construction of the Fully Underground LRT Alternative – Variation 1.

6.5.1.3 Community and Neighborhood Impacts

Refer to mitigation measures in Section 6.3.1.3. After implementation of these proposed mitigation measures, a potential less than significant community and neighborhood impact would occur during construction of the Fully Underground LRT Alternative – Variation 1.

6.5.1.4 Visual Resources and Aesthetics

Refer to mitigation measures in Section 6.3.1.4. After implementation of these proposed mitigation measures, a potential less-than-significant impact to visual resources and aesthetics would occur during construction of the Fully Underground LRT Alternative – Variation 1.

6.5.1.5 Air Quality

Refer to mitigation measures in Section 6.3.1.5. After implementation of these proposed mitigation measures, a potential significant and unavoidable construction air quality impact would occur under the Fully Underground LRT Alternative – Variation 1.

6.5.1.6 Noise and Vibration

Refer to mitigation measures in Section 6.3.1.6. After implementation of these proposed mitigation measures, a potential less-than-significant impact to noise and vibration would occur during construction of the Fully Underground LRT Alternative – Variation 1.

6.5.1.7 Geotechnical/Subsurface/Seismic/Hazardous Materials

Refer to mitigation measures in Section 6.3.1.7. After implementation of these proposed mitigation measures, a potential less-than-significant impact to geotechnical /subsurface

/seismic /hazardous materials would occur during construction of the Fully Underground LRT Alternative – Variation 1.

6.5.1.8 Water Resources

Refer to mitigation measures in Section 6.3.1.8. After implementation of these proposed mitigation measures, a potential less-than-significant impact to water resources would occur during construction of the Fully Underground LRT Alternative – Variation 1.

6.5.1.9 Cultural/Archeological

Refer to mitigation measures in Section 6.3.1.9. After implementation of these proposed mitigation measures, a potential less-than-significant impact to cultural/archeological resources would occur during construction of the Fully Underground LRT Alternative – Variation 1.

6.5.1.10 Paleontological Resources

Refer to mitigation measures in Section 6.3.1.10. Mitigation measures would not be feasible in areas where tunnels would be constructed using TBMs. Potential impacts in these areas would be unavoidable. Despite implementation of proposed mitigation measures where possible, potentially significant impacts to paleontological resources could occur during construction of the Fully Underground LRT Alternative – Variation 1.

6.5.1.11 Ecosystems and Biological Resources

Refer to mitigation measures in Section 6.3.1.11. After implementation of these proposed mitigation measures, a potential less-than-significant impact to ecosystems and biological resources would occur during construction of the Fully Underground LRT Alternative – Variation 1.

6.5.1.12 Parklands, Community Facilities, and Section 4(f)

Refer to mitigation measures in Section 6.3.1.12. After implementation of these proposed mitigation measures, a potential less-than-significant impact to parklands, community facilities, and Section 4(f) resources would occur during construction of the Fully Underground LRT Alternative – Variation 1.

6.5.1.13 Economic and Fiscal

Refer to mitigation measures in Section 6.3.1.13. After implementation of these proposed mitigation measures, a potential less than significant economic and fiscal impact would occur during construction of the Fully Underground LRT Alternative – Variation 1.

6.5.1.14 Safety and Security

Refer to mitigation measures in Section 6.3.1.14. After implementation of these proposed mitigation measures, a potential less-than-significant impact to safety and security would occur during construction of the Fully Underground LRT Alternative – Variation 1.

6.5.2 Indirect Impacts

6.5.2.1 Community and Neighborhood Impacts

Refer to Section 6.3.1.3 for mitigation measures regarding community and neighborhood impacts. Implementation of these proposed mitigation measures would result in no indirect adverse construction impacts.

6.5.2.2 Geotechnical/Subsurface/Seismic/Hazardous Materials

Refer to Section 6.3.1.7 for mitigation measures regarding community and neighborhood impacts. Implementation of these proposed mitigation measures would result in no indirect adverse construction impacts.

6.5.3 Cumulative Impacts

6.5.3.1 Traffic Circulation and Parking

Refer to mitigation measures in Section 6.3.1.1. After implementation of these proposed mitigation measures, a potential significant and unavoidable traffic circulation impact would remain during construction of the Fully Underground LRT Alternative – Variation 1.

6.5.3.2 Air Quality

Refer to mitigation measures in Section 6.3.1.5. After implementation of these proposed mitigation measures, a potential significant and unavoidable construction air quality impact would remain under the Fully Underground LRT Alternative – Variation 1.

6.6 Fully Underground LRT Alternative – Little Tokyo Variation 2

6.6.1 Direct Impacts

6.6.1.1 Traffic Circulation and Parking

Potential adverse impacts associated with traffic circulation are anticipated during the construction of the Fully Underground LRT Alternative – Variation 2. Refer to Section 6.3.1.1 for mitigation measures regarding traffic circulation and parking impacts. After implementation of these proposed mitigation measures, a potential significant and unavoidable adverse impact would remain during construction of the Fully Underground LRT Alternative – Variation 2.

6.6.1.2 Displacements and Relocation

Refer to mitigation measures in Section 6.3.1.2. After implementation of these proposed mitigation measures, a potential less-than-significant impact from displacements and relocation would occur during construction of the Fully Underground LRT Alternative – Variation 2.

6.6.1.3 Community and Neighborhood Impacts

Refer to mitigation measures in Section 6.3.1.3. After implementation of these proposed mitigation measures, a potential less than significant community and neighborhood impact would occur during construction of the Fully Underground LRT Alternative – Variation 2.

6.6.1.4 Visual Resources and Aesthetics

Refer to mitigation measures in Section 6.3.1.4. After implementation of these proposed mitigation measures, a potential less-than-significant impact to visual resources and aesthetics would occur during construction of the Fully Underground LRT Alternative – Variation 2.

6.6.1.5 Air Quality

Refer to mitigation measures in Section 6.3.1.5. After implementation of these proposed mitigation measures, a potential significant and unavoidable construction air quality impact would occur under the Fully Underground LRT Alternative – Variation 2.

6.6.1.6 Noise and Vibration

Refer to mitigation measures in Section 6.3.1.6. After implementation of these proposed mitigation measures, a potential less-than-significant impact to noise and vibration would occur during construction of the Fully Underground LRT Alternative – Variation 2.

6.6.1.7 Geotechnical/Subsurface/Seismic/Hazardous Materials

Refer to mitigation measures in Section 6.3.1.7. After implementation of these proposed mitigation measures, a potential less-than-significant geotechnical, subsurface, seismic, and hazardous materials impact would occur during construction of the Fully Underground LRT Alternative – Variation 2.

6.6.1.8 Water Resources

Refer to mitigation measures in Section 6.3.1.8. After implementation of these proposed mitigation measures, a potential less-than-significant impact to water resources would occur during construction of the Fully Underground LRT Alternative – Variation 2.

6.6.1.9 Cultural/Archeological

Refer to mitigation measures in Section 6.3.1.9. After implementation of these proposed mitigation measures, a potential less-than-significant impact to cultural/archeological resources would occur during construction of the Fully Underground LRT Alternative – Variation 2.

6.6.1.10 Paleontological Resources

Refer to mitigation measures in Section 6.3.1.10. Mitigation measures would not be feasible in areas where tunnels would be constructed using TBMs. Potential impacts in these areas would be unavoidable. Despite implementation of proposed mitigation measures where possible, potentially significant impacts to paleontological resources could occur during construction of the Fully Underground LRT Alternative – Variation 2.

6.6.1.11 Ecosystems and Biological Resources

Refer to mitigation measures in Section 6.3.1.11. After implementation of these proposed mitigation measures, a potential less-than-significant impact to ecosystems and biological resources would occur during construction of the Fully Underground LRT Alternative – Variation 2.

6.6.1.12 Parklands, Community Facilities, and Section 4(f)

Refer to mitigation measures in Section 6.3.1.12. After implementation of these proposed mitigation measures, a potential less-than-significant impact to parklands, community facilities, and Section 4(f) resources would occur during construction of the Fully Underground LRT Alternative – Variation 2.

6.6.1.13 Economic and Fiscal

Refer to mitigation measures in Section 6.3.1.13. After implementation of these proposed mitigation measures, a potential less than significant economic and fiscal impact would occur during construction of the Fully Underground LRT Alternative – Variation 2.

6.6.1.14 Safety and Security

Refer to mitigation measures in Section 6.3.1.14. After implementation of these proposed mitigation measures, a potential less-than-significant impact to safety and security would occur during construction of the Fully Underground LRT Alternative – Variation 2.

6.6.2 Indirect Impacts

6.6.2.1 Community and Neighborhood Impacts

Refer to Section 6.3.1.3 for mitigation measures regarding community and neighborhood impacts. Implementation of these proposed mitigation measures would result in no indirect adverse construction impacts.

6.6.2.2 Geotechnical/Subsurface/Seismic/Hazardous Materials

Refer to Section 6.3.1.7 for mitigation measures regarding community and neighborhood impacts. Implementation of these proposed mitigation measures would result in no indirect adverse construction impacts.

6.6.3 Cumulative Impacts

6.6.3.1 Traffic Circulation and Parking

Refer to mitigation measures in Section 6.3.1.1. After implementation of these proposed mitigation measures, a potential significant and unavoidable traffic circulation impact would remain during construction of the Fully Underground LRT Alternative – Variation 2.

6.6.3.2 Air Quality

Refer to mitigation measures in Section 6.3.1.5. After implementation of these proposed mitigation measures, a potential significant and unavoidable construction air quality impact would remain under the Fully Underground LRT Alternative – Variation 2.

7.0 CONCLUSIONS

7.1 No Build Alternative

7.1.1 NEPA Findings

The No Build Alternative would not result in construction related impacts. Therefore, no significant adverse impacts are anticipated, and no mitigation measures would be required.

7.1.2 CEQA Determinations

Based on the CEQA thresholds of significance, the No Build Alternative would not have significant construction impacts. No cumulative considerable impacts are anticipated. Therefore, no mitigation measures would be required.

7.2 Transportation Systems Management (TSM) Alternative

7.2.1 NEPA Findings

The TSM Alternative would not result in construction related impacts. Therefore, no significant adverse impacts are anticipated, and no mitigation measures would be required.

7.2.2 CEQA Determinations

Based on the CEQA thresholds of significance, the TSM Alternative would not have significant impacts during construction. No cumulative considerable impacts are anticipated. Therefore, no mitigation measures would be required.

7.3 At-Grade Emphasis LRT Alternative

Table 7-1 shows a summary of potential impacts by topic during construction of the At-Grade Emphasis LRT Alternative.

7.3.1 NEPA Findings

The At-Grade Emphasis LRT Alternative would have potentially adverse construction impacts related to following environmental topics:

- Traffic Circulation
- Displacements and Relocation
- Air Quality
- Noise and Vibration

- Community and Neighborhood Impacts
- Geotechnical/Subsurface/Seismic/Hazardous Materials
- Cultural/Archeological Resources
- Paleontological Resources
- Water Resources
- Economic and Fiscal Resources
- Ecosystems and Biological Resources

Potential mitigation measures would reduce these impacts to less than significant other than to air quality and traffic circulation. Implementation of mitigation measures would result in no direct, indirect, or cumulative adverse construction impacts other than to air quality and traffic circulation. Unavoidable adverse air quality and traffic circulation impacts are anticipated during construction.

Table 7-1. Summary of Construction Impacts for the At-Grade Emphasis LRT Alternative

Topic	Impact Determination	Mitigation	Impact After Mitigation
Traffic circulation	Potentially Adverse	Yes	Potentially Adverse
Land Use & Development	Not Adverse	No	Not Adverse
Displacement & Relocation	Potentially Adverse, two temporary construction easements	Yes	Not Adverse
Community & Neighborhood Impacts	Potentially Adverse, mobility and access reduced (NEPA Only)	Yes	Not Adverse
Visual Resources & Aesthetics	Not Adverse	Yes	Not Adverse
Air Quality	Potentially Adverse	Yes	Potentially Adverse for VOC, NO_x, and CO
Noise & Vibration	Potentially Adverse	Yes	Not Adverse

Table 7-1. Summary of Construction Impacts for the At-Grade Emphasis LRT Alternative

Topic	Impact Determination	Mitigation	Impact After Mitigation
Ecosystems/Biological Resources	Potentially Adverse	No	Not Adverse
Geotechnical/Subsurface/ Seismic/Hazardous Materials	Potentially Adverse, seismically induced settlement, exposure to hazardous materials	Yes	Not Adverse
Water Resources	Potentially Adverse, erosion, groundwater contamination	Yes	Not Adverse
Energy	Not Adverse	No	Not Adverse
Climate Change	Not Adverse	No	Not Adverse
Cultural- Archeological Resources	Potentially Adverse	Yes	Not Adverse
Paleontological	Potentially Adverse	Yes	Not Adverse
Parklands, Community Facilities & Section 4(f)	Potentially Adverse, reduction of access	Yes	Not Adverse
Economic & Fiscal	Potentially Adverse	Yes	Not Adverse
Safety & Security	Not Adverse	Yes	Not Adverse

7.3.2 CEQA Determinations

Based on the CEQA thresholds of significance, the At-Grade Emphasis LRT Alternative would have potentially significant construction impacts related to the following environmental topics:

- Traffic Circulation
- Displacements and Relocation
- Air Quality

- Noise and Vibration
- Geotechnical/Subsurface/Seismic/Hazardous Materials
- Cultural/Archeological Resources
- Paleontological Resources
- Water Resources
- Economic and Fiscal Resources
- Ecosystems and Biological Resources
- Parklands and Other Community Facilities

Significant and unavoidable air quality and traffic circulation construction impacts are anticipated after mitigation. Potential mitigation measures would reduce all other direct, indirect, and cumulative construction impacts to less than significant levels.

7.4 Underground Emphasis LRT Alternative

Table 7-2 shows a summary of impacts by topic during construction of the Underground Emphasis LRT Alternative.

7.4.1 NEPA Findings

The Underground Emphasis LRT Alternative would have potentially adverse construction impacts related to following environmental topics:

- Traffic Circulation
- Displacements and Relocation
- Air Quality
- Noise and Vibration
- Community and Neighborhood Impacts
- Ecosystems/Biological Resources
- Geotechnical/Subsurface/Seismic/Hazardous Materials
- Water Resources

- Cultural/Archeological Resources
- Paleontological Resources
- Economic and Fiscal Resources
- Ecosystems and Biological Resources
- Parklands and Other Community Facilities

Unavoidable adverse air quality and traffic circulation construction impacts are anticipated to remain after mitigation. Potential mitigation measures would all other potential direct, indirect, and cumulative construction impacts to less than significant levels.

Table 7-2. Summary of Construction Impacts for the Underground Emphasis LRT Alternative

Topic	Impact Determination	Mitigation	Impact After Mitigation
Traffic circulation	Potentially Adverse	Yes	Potentially Adverse
Land Use & Development	Not Adverse	No	Not Adverse
Displacement & Relocation	Potentially Adverse, eight temporary construction easements	Yes	Not Adverse
Community & Neighborhood Impacts	Potentially Adverse, mobility and access reduced (NEPA Only)	Yes	Not Adverse
Visual Resources & Aesthetics	Not Adverse	Yes	Not Adverse
Air Quality	Potentially Adverse	Yes	Potentially Adverse for VOC, NO_x, and CO
Noise & Vibration	Potentially Adverse	Yes	Not Adverse
Ecosystems/Biological Resources	Potentially Adverse	No	Not Adverse
Geotechnical/Subsurface/ Seismic/Hazardous Materials	Potentially Adverse, seismically induced settlement, exposure to hazardous materials	Yes	Not Adverse

7.4.2 CEQA Findings

Based on the CEQA thresholds of significance, the Underground Emphasis LRT Alternative would have potentially significant construction impacts related to the following topics:

- Traffic Circulation
- Displacements and Relocation
- Air Quality
- Noise and Vibration
- Geotechnical/Subsurface/Seismic/Hazardous Materials
- Cultural/Archeological Resources

- Paleontological Resources
- Water Resources
- Economic and Fiscal Impacts
- Ecosystems and Biological Resources
- Parklands and Other Community Facilities

Significant and unavoidable paleontology, air quality and traffic circulation construction impacts are anticipated to remain after mitigation. Potential mitigation measures would reduce all other potential direct, indirect, and cumulative construction impacts to less than significant levels.

7.5 Fully Underground LRT Alternative – Little Tokyo Variation 1

Table 7-3 shows a summary of impacts by topic during construction of the Fully Underground LRT Alternative – Little Tokyo Variation 1.

Table 7-3. Summary of Construction Impacts for the Fully Underground LRT Alternative – Little Tokyo Variation 1

Topic	Impact Determination	Mitigation	Impact After Mitigation
Traffic circulation	Potentially Adverse	Yes	Potentially Adverse
Land Use & Development	Not Adverse	No	Not Adverse
Displacement & Relocation	Potentially Adverse, five temporary construction easements	Yes	Not Adverse
Community & Neighborhood Impacts	Potentially Adverse, mobility and access reduced (NEPA Only)	Yes	Not Adverse

7.5.1 NEPA Findings

The Fully Underground LRT Alternative – Little Tokyo Variation 1 would have potentially adverse construction impacts related to following environmental topics:

- Traffic Circulation
- Displacements and Relocation

- Air Quality
- Noise and Vibration
- Community and Neighborhood Impacts
- Ecosystems/Biological Resources
- Geotechnical/Subsurface/Seismic/Hazardous Materials
- Water Resources
- Cultural/Archeological Resources
- Paleontological Resources
- Economic and Fiscal Impacts
- Ecosystems and Biological Resources
- Parklands and Other Community Facilities

Unavoidable adverse air quality and traffic circulation construction impacts are anticipated to remain after mitigation. Potential mitigation measures would reduce all other potential direct, indirect, and cumulative construction impacts to less than significant levels.

7.5.2 CEQA Determinations

Based on the CEQA thresholds of significance, the Fully Underground LRT Alternative – Little Tokyo Variation 1 would have potentially significant construction impacts related to the following topics:

- Traffic Circulation
- Displacements and Relocation
- Air Quality
- Noise and Vibration
- Geotechnical/Subsurface/Seismic/Hazardous Materials
- Cultural/Archeological Resources
- Paleontological Resources

- Water Resources
- Economic and Fiscal Impacts
- Ecosystems and Biological Resources

Significant and unavoidable paleontology, air quality and traffic circulation construction impacts are anticipated to remain after mitigation. Potential mitigation measures would reduce all other potential direct, indirect, and cumulative construction impacts to less than significant levels.

7.6 Fully Underground LRT Alternative – Little Tokyo Variation 2

Table 7-4 shows a summary of impacts by topic during construction of the Fully Underground LRT Alternative – Little Tokyo Variation 2.

7.6.1 NEPA Findings

Fully Underground LRT Alternative – Little Tokyo Variation 2 would have potentially adverse construction impacts related to following environmental topics:

- Traffic Circulation
- Displacements and Relocation
- Air Quality

- Noise and Vibration
- Community and Neighborhood Impacts
- Ecosystems/Biological Resources
- Geotechnical/Subsurface/Seismic/Hazardous Materials
- Water Resources
- Cultural/Archeological Resources
- Paleontological Resources
- Economic and Fiscal Impacts
- Ecosystems and Biological Resources

Unavoidable adverse air quality and traffic circulation construction impacts are anticipated to remain after mitigation. Potential mitigation measures would reduce all other potential direct, indirect, and cumulative construction impacts to less than significant levels.

7.6.2 CEQA Determinations

Based on the CEQA thresholds of significance, the Fully Underground LRT Alternative – Little Tokyo Variation 2 would have potentially significant construction impacts related to the following topics:

- Traffic Circulation
- Displacements and Relocation
- Air Quality
- Noise and Vibration
- Geotechnical/Subsurface/Seismic/Hazardous Materials
- Cultural/Archeological Resources
- Paleontological Resources
- Water Resources
- Economic and Fiscal Impacts

- Ecosystems and Biological Resources

Significant and unavoidable paleontology, air quality and traffic circulation construction impacts are anticipated to remain after mitigation. Potential mitigation measures would reduce all other potential direct, indirect, and cumulative construction impacts to less than significant levels.

7.7 Comparison of Build Alternatives

INTRODUCTION

1.1 Overview

The Los Angeles County Metropolitan Transportation Authority (Metro) has begun preparing an Environmental Impact Statement (EIS)/Environmental Impact Report (EIR) for the Regional Connector Transit Corridor Project in accordance with the National Environmental Policy Act (NEPA) and the California Environmental Quality Act (CEQA). The Federal Transit Administration (FTA) is the lead agency for the purposes of NEPA, and Metro is the lead agency for the purposes of CEQA.

Over the past two decades, Metro and its predecessor agencies (Los Angeles County Transportation Commission and Southern California Rapid Transit District) have initiated rail transit service in multiple corridors spanning much of Los Angeles County. Three of Metro's current and under-construction light rail transit (LRT) lines serve downtown Los Angeles, but they do not directly connect to one another. The existing Metro Blue Line to Long Beach and the Metro Expo Line to Culver City (scheduled to open in 2010) terminate at 7th Street/Metro Center Station in the southern part of the downtown area. The Metro Gold Line to Pasadena and East Los Angeles (East Los Angeles extension is scheduled to open in late 2009) passes through the northeastern portion of the downtown area with stops at Union Station and Little Tokyo/Arts District Station. Passengers must transfer to the heavy rail Metro Red and Purple Lines in order to make connections between these light rail lines.

The proposed Regional Connector project would provide new LRT tracks through downtown Los Angeles that would link the Metro Blue, Expo, and Gold Lines and enable them to operate as a single system. For example, trains would run directly from Long Beach to Pasadena and from East Los Angeles to Culver City via the Regional Connector route, with no need for passengers to transfer to the Metro Red or Purple Lines. The proposed Regional Connector project would also include new stations in downtown Los Angeles, thereby expanding the rail transit coverage of the central business district.

A Final Alternatives Analysis (AA) Report was prepared for the Regional Connector Transit Corridor and published by Metro in January 2009. The AA report is incorporated into this Scoping Report by reference. During the AA process, Metro hosted agency and public early scoping meetings and community updates. The input received at these meetings, as well as subsequent technical analysis, formed the basis for narrowing the initial 32 conceptual alternatives to two LRT alternatives for study in the EIS/EIR, along with a No Build Alternative and a Transportation System Management (TSM) Alternative. Subsequent to the release of the Final AA report, FTA and Metro initiated the public and agency NEPA and CEQA scoping to obtain input on the scope of the EIS/EIR. The Notice of Intent/Notice of Preparation (NOI/NOP) identified the four alternatives carried forward from the AA for study. This report summarizes the results of the NEPA/CEQA scoping process.

The Draft EIS/EIR (DEIS/DEIR) will build upon the AA study and form the basis for selection of a Locally Preferred Alternative (LPA), performance of Preliminary Engineering, and preparation of a subsequent Final EIS/EIR. One of the primary purposes of scoping is to identify possible environmental impacts of the project, and eliminate proposed alternatives with substantial environmental impacts from further analysis. High-capacity transit improvements in the Regional Connector Transit Corridor would be financed with a mix of local, state, federal New Starts, and other federal funds. Accordingly, the project will be executed in compliance with current FTA Section 5309 New Starts guidelines, and all environmental documents will satisfy NEPA and CEQA requirements.

The proposed Regional Connector Transit Corridor Project is also designated to receive funding from Measure R, a half cent sales tax measure passed by Los Angeles County voters in November 2008. The project is also included in Metro's Draft 2008 Long Range Transportation Plan. Final adoption of the 2008 Long Range Transportation Plan by the Metro Board of Directors is expected to occur in mid-2009.

1.2 Project Area

The proposed project lies entirely within the downtown area of the City of Los Angeles. The project area is generally bounded by US Highway 101 on the north, 7th and 9th Streets on the south, Alameda Street on the east, and State Route 110 on the west. A map of the project area is provided in Figure 1-1.

1.3 Alternatives

Four alternatives were carried forward from the AA process for study in the EIS/EIR (See Appendix A for maps of alternatives). These include the No Build Alternative, the TSM Alternative, and two LRT Alternatives. The **No Build Alternative** would maintain existing transit service through the year 2030. No new transportation infrastructure would be built, except projects identified as funded under Metro's 2008 Long Range Transportation Plan. Transit service under the No-Build Alternative would be focused on the preservation of existing services and projects. By the projection year of 2030, some bus service would have been reorganized and expanded to provide connections with the new rail lines; however, the transit network within the project area would largely be the same as it is now.

The **TSM Alternative** would include the provisions of the No Build Alternative and add two shuttle bus routes from 7th Street/Metro Center station to Union Station, providing an enhanced link between the unconnected LRT lines. One route would run along Grand Avenue and 1st Street, and one along Figueroa, Flower, 2nd, and 3rd Streets. The shuttle buses would use existing bus-only lanes, where available, and would be fitted with transit-priority signalization devices similar to those used on Metro Rapid. Stops would be located every few blocks so as to provide full coverage of the area. Each shuttle route would be one and one-half to two miles in length.

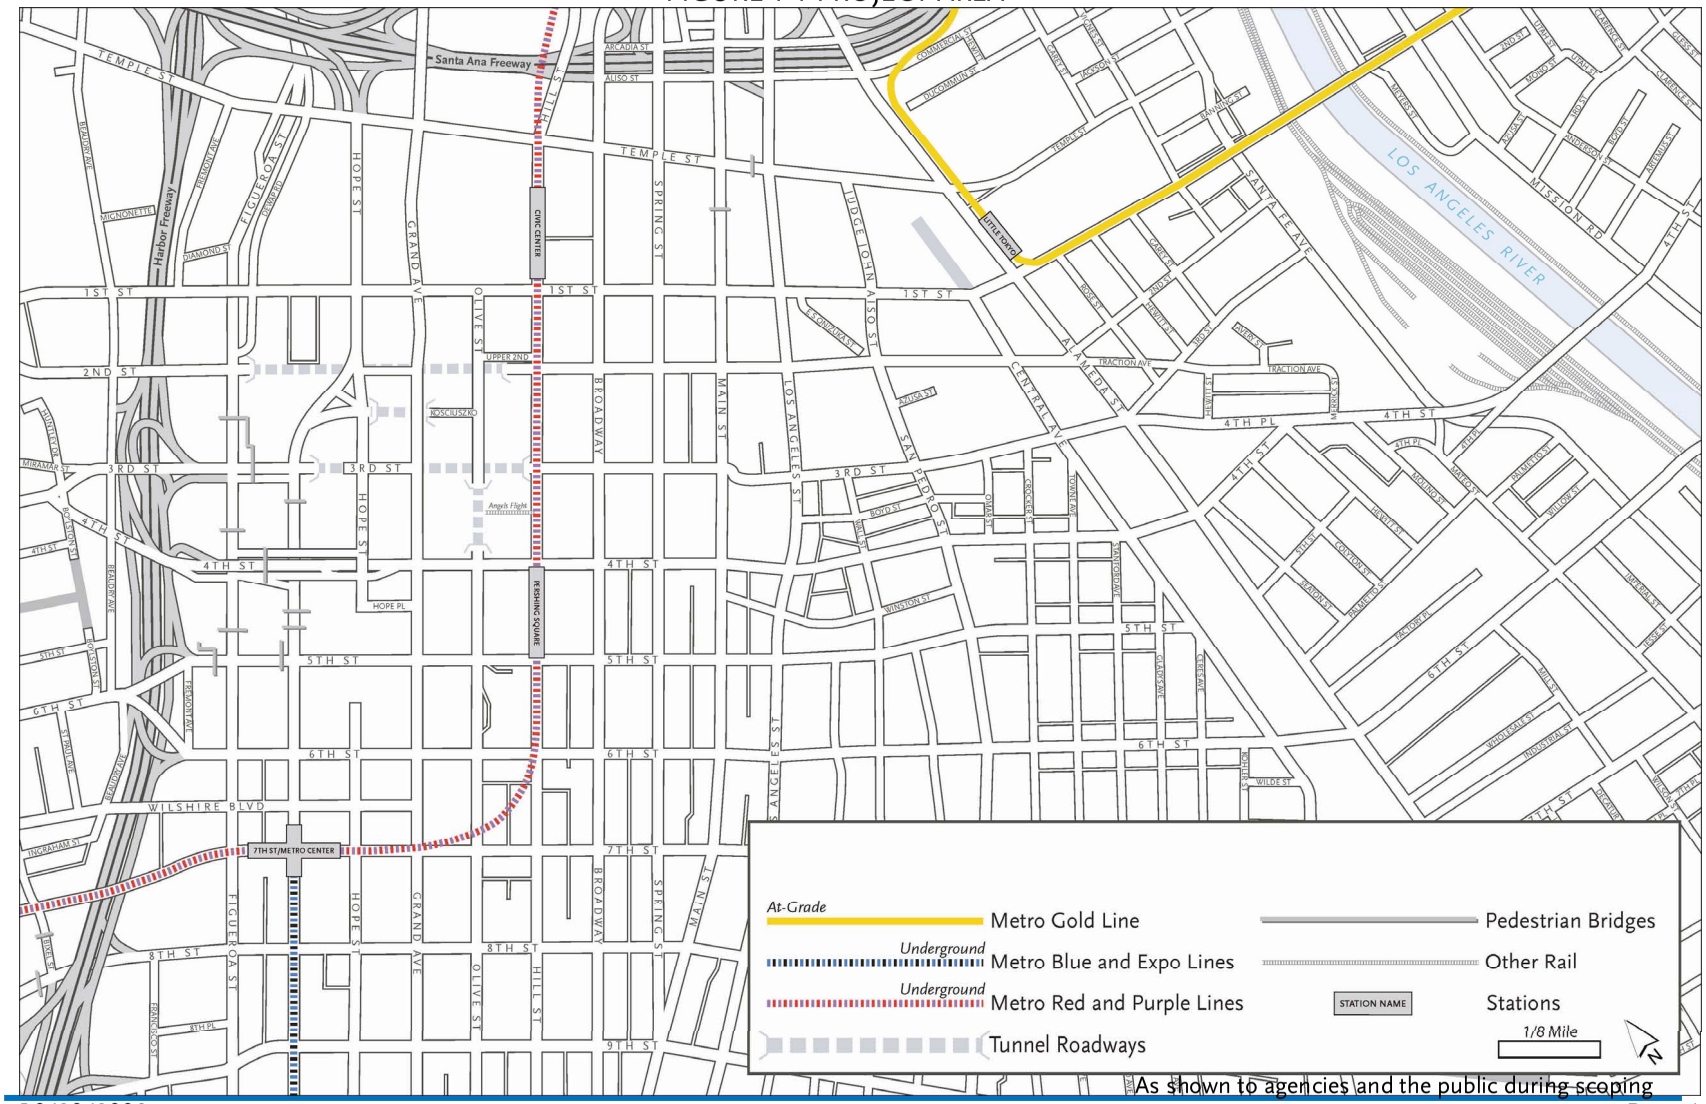
The **At-Grade Emphasis LRT Alternative** would extend north under Flower Street from 7th Street/Metro Center Station, surface to at-grade north of 5th Street, cross 3rd Street, enter Bunker Hill, and turn northeast through a new entrance to the existing 2nd Street tunnel. The alignment would continue along 2nd Street where it would split into an at-grade couplet configuration on Main and Los Angeles Streets (one track on each roadway) to Temple Street. Then it would head east on Temple Street, realign into a dual track configuration east of Los Angeles Street, and join the Metro Gold Line just north of the Little Tokyo/Arts District Station on Alameda Street. Trains headed east toward East Los Angeles would then proceed to Little Tokyo/Arts District Station. Trains headed north toward Pasadena would bypass Little Tokyo/Arts District Station and proceed to Union Station. An automobile underpass and pedestrian overpass would be constructed at the intersection of Temple and Alameda Streets to reduce pedestrian-train and automobile-train conflicts.

There are two options for the At-Grade Emphasis LRT Alternative's configuration on Flower Street. For Option A, tracks would extend north under Flower Street from 7th Street/Metro Center Station to a new underground station just south of 5th Street, then surface just before crossing 3rd Street at grade. For Option B, tracks would extend north under Flower Street from 7th Street/Metro Center Station and surface between 5th and 4th Streets before reaching a new at-grade station just south of 3rd Street, then the tracks would continue across 3rd Street at grade. In total, the At-Grade Emphasis LRT Alternative would add 1.8 miles of new double track to the light rail system.

In addition to the Option A and Option B Station configurations, there would be an underground station south of 2nd and Hope Streets and a split station on Main and Los Angeles Streets between 1st and Temple Streets.

The **Underground Emphasis LRT Alternative** would extend north along Flower Street from 7th Street/Metro Center Station with a new underground station north of 5th Street. At 2nd Street, the underground tunnel would extend east. New underground stations at 2nd and Hope Streets and on 2nd Street between Los Angeles Street and Broadway would provide access to Bunker Hill and to the area south of the Civic Center. The tunnel would emerge to at-grade connections just southwest of the intersection of 1st and Alameda Streets. At 1st and Alameda Streets, a new underpass would carry car and truck traffic along Alameda Street below the rail junction, and a new overhead pedestrian bridge structure would eliminate most conflicts between pedestrians and trains. Trains headed north toward Union Station and Pasadena would then proceed to the Little Tokyo/Arts District station, while trains headed east toward East Los Angeles would bypass the station and continue to Pico/Aliso station. This alternative would have a single at-grade crossing at the intersection of 1st and Alameda Streets. The rest of the route would be underground. The length of this proposed route would be 1.6 miles.

FIGURE 1-1 PROJECT AREA



As shown to agencies and the public during scoping

1.4 Summary of Purpose and Need

The purpose of this project is to improve the region's public transit service and mobility. The overall goal of the project is to improve mobility within the corridor by connecting the light rail services of the Metro Gold Line to Pasadena, the Metro Gold Line Eastside Extension, the Metro Blue Line, and the Metro Expo Line.

The proposed Regional Connector Transit Corridor project would improve region-wide public transit service, despite being located in a relatively small portion of downtown Los Angeles. The connection would allow direct light rail service from Long Beach to Pasadena and East Los Angeles to Culver City, with both services using the same tracks and stations in downtown Los Angeles. This service improvement would in turn eliminate many transfers, reduce wait time, overcrowding at stations, and shorten trip times across the entire light rail system.

The project area is located within the largest regional employment center of Los Angeles, and is densely developed with multi-family residences, industrial and public lands, commercial and retail establishments, government office buildings, and private high-rise office towers. The enhanced transit services made possible by the proposed Regional Connector project would serve communities across the region, allowing greater mobility between existing light rail corridors and improved access to downtown Los Angeles. The project would thus help the transportation system accommodate the population and employment growth projected to occur in central business district between now and 2030. Mobility issues throughout the region and the identified need to join the unconnected segments of the light rail system have been documented in several past studies, including the *Pasadena – Los Angeles Light Rail Transit Project Environmental Impact Report* (1993), the *Blue Line Connection Preliminary Planning Study* (1993), and the *Regional Light Rail Connector Study* (2004).

Additional considerations that support implementation of the proposed Regional Connector Transit Corridor project include:

- Potential for increased travel times and station overcrowding in the absence of substantial capacity increases. This is primarily due to the number of transfers required to traverse the project area, and the need to reverse trains in the busiest parts of the system. Station overcrowding is a safety concern.
- Poor schedule reliability due to the need to reverse trains in downtown Los Angeles, the busiest part of the regional rail system.
- Current system enhancements under construction will increase transit ridership in the project area and magnify the effects of poor system connectivity and station overcrowding due to transfers.
- High numbers of transit dependent residents living in the project area.

- Existing high transit ridership in the project area is projected to increase.
- High concentrations of transit-supportive land uses in the project area.
- Substantial population, employment, and congestion growth in the project area is expected by 2030.
- Location of several redevelopment areas within the project area, where improved transit access can support properly located economic growth.

1.5 Project Participants

The project participants include FTA, Metro, and Metro's consultants. Metro's consultants include the Community Participation Program Consultant (The Robert Group), the Environmental and Engineering Consultant (CDM), and CDM's subconsultants. Other project participants include federal, state, and local participating agencies identified in accordance with the Safe, Accountable, Flexible, Efficient Transportation Equity Act – A Legacy for Users (SAFETEA-LU) 6002.

1.6 Purpose of Report

The Council on Environmental Quality's NEPA regulations and the State of California's CEQA guidelines require federal and state lead agencies to conduct agency and public scoping when defining the appropriate range of issues and depth of analysis for a major environmental document (40 CRF part 1500 et seq.; 14 CA Code of Regulations, §15082-15083). This Scoping Report documents the proposed Regional Connector Transit Corridor project's lead agencies' compliance with these requirements.

SCOPING PROCESS

2.1 Early Scoping Activities

In order to help define the purpose and need and identify a range of reasonable alternatives, Metro conducted an AA, an early public scoping process consistent with the Federal Transit Administration's (FTA) guidelines. This "early scoping" process was designed to solicit stakeholders' views on the possible range of alternatives with regards to transportation modes, potential alignments, and station locations.

Between October 2007 and fall 2008, the Regional Connector Transit Corridor project conducted an extensive stakeholder outreach effort. The community outreach effort successfully raised awareness about the study, engaged stakeholders and, most importantly, garnered public input at key decision points that demonstrated widespread consensus about the study recommendations that required Board approval in order to move forward into the environmental process.

Recognizing the unique challenges and opportunities of the study, as well as its potential impacts beyond the immediate Downtown area, the AA outreach program included the following key elements:

- Public meetings, including one series of early public and agency scoping meetings, and two series of public update meetings at key study milestones
- Targeted stakeholder meetings to address specialized issues and localized concerns
- Multi-lingual outreach to include Japanese and Spanish-speaking stakeholders
- Multi-tiered meeting notifications including direct mail, print and broadcast media, advertisements, internet based distribution via e-mail and notices or ads onboard Metro buses and trains
- Employment of "new" media tools such as blogs, social networks and other internet or web-based tools to involve a wider audience in the decision-making process

Early scoping commenced with a briefing for elected officials and their staff on October 17, 2007. An agency early scoping meeting was held on October 30, 2007 at Metro Headquarters followed by publication of an Early Scoping Notice to Conduct an AA in the Federal Register on October 31, 2007. Early public scoping meetings were subsequently held on November 6 and 7, 2007 in downtown Los Angeles at the Los Angeles Central Library and the Japanese American National Museum; a daytime meeting was scheduled to ensure that people working in downtown would have an opportunity to participate in the process, and a nighttime meeting was held to encourage those living in the area to provide their input. The public outreach process is described in the "Final Project Early Scoping Report" published by Metro

in March 2008 (incorporated by reference into this scoping report and available at http://www.metro.net/projects_studies/connector/news_info.htm).

Metro reviewed all public comments from the early scoping meetings and, based on this feedback, developed eight alternatives for further analysis including various modes, alignments and station locations.

A second series of public meetings was held in February 2008 to provide a general study update, review comments and outcomes from the public early scoping meetings and discuss proposed criteria for how project alternatives would be analyzed and screened. A third and final series of public meetings for the AA phase was held in October 2008. These meetings provided Metro with an opportunity to present its recommendations to the public before proceeding to the Metro Board for consideration. A majority of attendees were supportive of the Regional Connector and see this as a cost effective project that will benefit the entire County of Los Angeles and downtown residents.

In addition to these public scoping and update meetings, numerous briefings and meetings were held with key stakeholder groups throughout the AA study period. Targeted stakeholder meetings took place with local elected officials and their staff, elected citizens groups and Neighborhood Councils, residential associations, business, cultural and civic organizations, and religious congregations. These meetings allowed Metro to address stakeholder questions, issues and concerns which were instrumental in developing consensus around the ultimate recommendations.

During the AA phase, the majority of public comments submitted expressed a preference for Light Rail Transit (LRT) technology with a predominantly underground alignment. Preferred station locations included the Financial District, the Bunker Hill/Grand Avenue project area, and connections to Historic Broadway and Little Tokyo. Additional concerns were raised about impacts during construction, compatibility with existing automobile and bus traffic, and traffic management during downtown events.

Throughout the AA phase, there was widespread support for the Regional Connector project to move forward for further in-depth study and into environmental review and clearance. This support was expressed not only by residents and business interests in downtown Los Angeles, but also by transit riders and advocates from across the region.

2.2 DEIS/DEIR Scoping Activities

In January 2009, Metro's Board of Directors approved the Regional Connector Transit Corridor AA Study and authorized staff to proceed with the DEIS/DEIR. The AA process is described in the Final AA Report (Metro 2009) and is incorporated by reference into this scoping report. The Final AA Report may be found at: http://www.metro.net/projects_studies/connector/news_info.htm. This next phase will

continue the transparent and inclusive community outreach process, building upon the public engagement efforts developed during the AA.

2.2.1 Public Participation Plan

In order to ensure that the public remain informed on an ongoing basis and provided with opportunities to comment at key milestones during the DEIS/DEIR process, a detailed Community Outreach and Public Participation Plan (PPP) has been developed. The plan covers both scoping activities and the DEIS/DEIR public involvement process. A summary of the Public Participation Plan by The Robert Group (TRG) can be found in Appendix B.

The PPP includes elements such as stakeholder identification, communications protocols, public input tracking, a proposed schedule for interfacing with the public and recommendations for how meetings should be conducted at various milestones during the of the NEPA process. Additional recommendations for key stakeholder interviews or briefings, inter-agency coordination, topic specific and general meetings are also included in the PPP. Additionally, it includes recommendations for generating publicity for public meetings, and information dissemination via the web and "new" media opportunities to engage the public. It is important to note, that while plans are important, the public involvement activities, especially for this complex project, were developed to be flexible enough to accommodate changing circumstances and enhanced approaches.

The PPP includes outreach to engage not only downtown Los Angeles stakeholders, but also current and potential light rail riders, and a wider population of transit users in Los Angeles County. The outreach efforts outlined in the PPP will also re-engage targeted stakeholders from the AA phase while, at the same time, identifying and involving potential new interested stakeholders who may have a special interest in this project. PPP recommendations are based on Metro's experience with the AA.

2.2.2 Coordination Plan

Section 6002 of the Safe, Accountable, Flexible, Efficient Transportation Equity Act: A Legacy for Users (SAFETEA-LU) established an environmental review process for transit projects that has now been included in Section 139 of Title 23 of the U.S. Code. Section 139 directs agencies to prepare a plan for public and agency participation and comments during the environmental review process. The Coordination Plan describes how the lead agencies will provide opportunities for public and agency input.

2.3 Initiation of Scoping (Notice of Intent/Notice of Preparation)

FTA published the NOI in the Federal Register on March 24, 2009. The publication of the NOI is the official federal notification of the agency's intent to prepare a DEIS. The NOI included notification of the dates and locations of the agency and public scoping meetings, the public comment period, as well as a description of the project purpose and need and

alternatives. The NOI initiates the NEPA scoping process. A copy of the NOI is in Appendix C.

Metro posted the NOP with the California State Clearinghouse and mailed the NOP to state and local agencies on March 17, 2009. The NOP was also recorded with the Los Angeles County Clerk's Office on March 17, 2009. Publication of the NOP with the State Clearinghouse was done in compliance with California Environmental Policy Act (CEQA) requirements. A copy of the NOP may be found in Appendix D. Publications of the legal notices were also published in local newspapers such as the Los Angeles Times and La Opinion. A copy of these legal notices can be found in Appendix E.

In addition, Metro mailed the NOP and scoping information to 18 Federal, 4 Native Tribes, 31 State, 6 regional, and 11 local agencies to inform them of the start of the DEIS/DEIR scoping process and invite comments. The NOP was mailed to these agencies with a return receipt requested to provide proof of receipt. The complete list of agencies notified in this manner is included in Appendix F.

Comments were accepted by Metro from the date of publication in the Federal Register (March 24, 2009) through May 11, 2009. This provided a public comment period of 49 days.

2.4 Agency Scoping

2.4.1 Participating Agencies

Participating agencies can be Federal, State, tribal, regional, and local government agencies that may have an interest in the project. In accordance with SAFETEA-LU Section 6002 requirements, Metro, in coordination with the FTA, prepared and mailed participating agency invitation letters to 159 agencies with a potential interest in the project in March 2009. The identification of potential participating agencies built on the list of agencies identified through the AA process.

The responsibilities of these agencies include, but are not limited, to:

- Participating in the NEPA/CEQA process starting at the earliest possible time, especially with regards to the development of the purpose and need statement, range of alternatives, methodologies, and the level of detail for the analysis of alternatives
- Identify, as early as practicable, any issues of concern regarding potential environmental or socioeconomic impacts of the project
- Participate in the issue resolution process, described in Section 3.4 of this Plan
- Provide meaningful and timely input on unresolved issues
- Participate in the scoping process

Accepting the designation as a participating agency does not indicate project support and does not provide the agency with increased oversight or approval authority beyond its statutory limits.

Participating agencies for the project are listed in Appendix G. They include federal agencies that did not affirmatively decline the invitation to become a participating agency, and regional, state and local agencies that affirmatively accepted the invitation to become a participating agency. Agencies were given 30 days from the date of the letter to respond. Agencies may also request to be added at any time during the process. Appendix H contains two sample invitation letters; one that was sent to federal agencies and tribes and one that was sent to state, regional, and local agencies.

2.4.2 Cooperating Agencies

Cooperating agencies are, by definition in 40 CFR 1508.5, federal agencies with jurisdiction, by law or special expertise, with respect to any environmental impact involved in the proposed project. A state or local agency of similar qualifications may, by agreement with the lead agency, also become a cooperating agency. The cooperating agencies are by definition participating agencies as well, and while the roles and responsibilities of both are similar, the cooperating agencies have a slightly greater degree of authority, responsibility, and involvement in the environmental review process.

No cooperating agencies have been identified for the Regional Connector Transit Corridor project.

2.4.3 Agency Scoping Meeting

One Agency Scoping meeting was held as follows:

Time: Thursday, March 26, 2009, 1:30P.M.

Location: Metro, Gateway Plaza Room
One Gateway Plaza
Los Angeles, CA 90012

Comments: 9 verbal, 0 written

Attendees: 19, representing the following agencies and jurisdictions (Sign-in sheet included in Appendix I:

- City of Los Angeles Community Redevelopment Agency (CRA)
- City of Los Angeles Department of Public Works, Bureau of Engineering
- City of Los Angeles Department of Public Works, Bureau of Sanitation

- City of Los Angeles Fire Department (LAFD)
- City of Los Angeles Police Department (LAPD)
- City of Pasadena
- Federal Transit Administration (FTA)
- Los Angeles County Office of Education
- Los Angeles County Sheriff's Department, Transportation Safety
- Solar Enlightenment
- Southern California Association of Governments (SCAG)
- State of California Department of Transportation
- University of California, Los Angeles

The meeting included a PowerPoint presentation similar to the one shown at the public scoping meetings and described in Section 2.5.4.1.

2.4.3.1 Agency Scoping Meeting Comments

The topics addressed in the question and answer session included:

- Inquiry as to current property owners along the proposed right-of-way for the two LRT alternatives
- A discussion of the capital cost estimates for each alternative and proposed funding sources
- Priority level of the project compared to other current Metro projects
- Safety issues including
    - Project's potential to relieve crowding at 7th Street/Metro Center Station
    - Safety features of at-grade crossings on the At-Grade Emphasis LRT Alternative
- Design details including
    - Locations and depths of the proposed underground stations

- Configuration of the intersection of 1st and Alameda Streets proposed for the Underground Emphasis LRT Alternative
- Issues with placing rail facilities on the northeast corner of 1st and Alameda Streets

- Operational issues including:
  - Proposed operation plans and transfer points
  - Potential service changes at Little Tokyo/Arts District Station under the two LRT alternatives
- Redefinition of rail line names and colors once Regional Connector service begins

A full transcript of the agency scoping meeting proceedings is provided in Appendix J.

2.4.4 State Historic Preservation Office (SHPO) Coordination

The State Historic Preservation Office (SHPO) was provided with a scoping package and a Draft Area of Potential Effects (APE) map on March 13, 2009. FTA wrote a letter to the SHPO on April 7, 2009 asking that Metro coordinate direct with SHPO for Section 106 compliance. SHPO concurred with the Draft APE map on September 9, 2009.

2.5 Public Scoping

Notification of the public scoping meetings was completed via several forms of media as described further in this section. This outreach was in addition to the official notices published in the Federal Register and posted with the State Clearinghouse. Four public scoping meetings were held as described in Section 2.5.3.

2.5.1 Notification Database

Metro maintained and updated the stakeholder database developed during the AA study to track interested individuals and groups, their areas of interest, communication, and other pertinent information for the duration of the project. To the extent possible, Metro includes mailing addresses as well as email contact information on the database. A list of the public agency database entries is provided in Appendix K.

Since the project has regional benefits and, potentially, impacts, Metro is building the outreach database to be more inclusive of stakeholders beyond the downtown area. This is being accomplished by selectively importing information from Metro's existing databases from other projects into the Regional Connector database, as well as targeting councils of governments and those jurisdictions potentially benefiting from the project. The project database will be used to communicate with project stakeholders, including:

- Elected officials on the local, state and federal level
- Neighborhood councils and other elected groups
- Homeowners associations and neighborhood organizations
- Chambers of Commerce, local business improvement districts (BIDs) and business leaders
- Property management firms serving lofts and condominiums in the downtown Los Angeles area
- Community-based and civic organizations
- Large employers and operators of key destinations
- Transportation advocates and interest groups
- Print, broadcast and electronic media, including community-based publications and blogs
- Stakeholders who attended any AA meeting or provided comment
- Other interested groups and persons

For the purposes of notification for the public scoping meetings, the existing AA database was updated to include contact information for new neighborhood council members, and unit numbers for a number of residential buildings. In addition, Metro completed a walk -through of the project area to further identify stakeholders who were then added to the database. At the time of the scoping meetings, 1,542 entries were listed on the Regional Connector database.

2.5.2 Public Notification Activities

A variety of methods were employed to notify stakeholders about the public scoping meetings. These meetings were publicized via direct mail notices to the project database; emails; postings on Metro's website; display advertisements in multi-lingual publications (English, Spanish and Japanese); notices placed on Metro buses and trains serving the project area; a press release which was sent to at least 83 local, regional, ethnic and multi-lingual publications as well as blogs; and through grassroots outreach to downtown property owners and residential management companies. Noticing was conducted in English, Spanish and Japanese.

2.5.2.1 Direct Mail

A scoping notification letter was translated into English, Spanish and Japanese and distributed by US Mail on March 16, 2009, to the postal addresses on the existing project database. The sample letter, which indicates the date, time and address of each scoping meeting, is included in Appendix L.

2.5.2.2 Take Ones

Preceding the public scoping meetings, "Take One" brochures inviting transit users to the scoping meetings were placed on Metro buses and the Metro Gold and Blue Lines in or adjacent to the project area. The "Take Ones" were identical in content to the direct mail notices described in Section 2.5.2.1 and are included in Appendix M.

2.5.2.3 Email Blasts

The project team disseminated e-mail blasts, or electronic mailings, to all stakeholders in the database with email addresses, including elected officials, neighborhood councils, and community-based organizations. These groups then were asked to forward these e-mails to their constituents and/or members. E-mail blasts are typically used to distribute the scoping meeting announcements and other project information instantly and to large numbers of people.

Electronic distribution of the meeting notice took place on March 16, 2009. Notices were sent to 721 email addresses within the existing project database. A copy of the email is included in Appendix N.

2.5.2.4 Newspaper Advertisements

Display advertisements for the scoping meetings were placed in five newspapers within the project area and were selected based on their geographic focus, language needs, and audited circulation numbers. A sample newspaper advertisement is included in Appendix O.

- *Rafu Shimpo* (English/Japanese)
    - Date: March 23, 2009
    - Circulation: 45,000 weekly
    - Serves the Japanese and Little Tokyo community within study area
- *Downtown News*
    - Date: March 20, 2009
    - Circulation: 49,000 weekly

- Serves Downtown Los Angeles and is widely distributed in the study area, including at transit stops

- *Daily Trojan*
  - Date: March 23, 2009
  - Circulation: 9,000 daily
  - Serves the University of Southern California Campus in the Exposition Park/South Park area adjacent to the study area

- *Garment and Citizen* (Spanish/English)
  - Dates: March 20, 2009
  - Circulation: 25,000 weekly
  - Serves Downtown Los Angeles area and is widely distributed to Spanish speaking workers within the study area

- *Pasadena Star News*
  - Dates: March 23, 2009
  - Circulation: 89,000 daily
  - Serves the City of Pasadena and wider portions of the San Gabriel Valley

2.5.2.5 Project Webpage

The project website, located at www.metro.net/regionalconnector, that was initially used for the AA, was updated for the purposes of the DEIS/DEIR, including publicizing the public scoping meetings. Website content for the Regional Connector included a project overview, information about upcoming meetings and other materials including Fact Sheets, presentations made at the public meetings, and other information of interest to the public from the AA. The website will continue to be updated at key milestones. Some materials posted to the website were translated into Spanish and Japanese.

2.5.2.6 Additional Outreach During Public Scoping Period

In order to maximize the coverage of the outreach effort for the scoping meetings, Metro undertook some creative approaches to engage the public as follows:

- Grassroots canvassing was conducted on March 26 and 27, 2009, at Union Station to distribute scoping meeting information to Gold Line riders. Over 3,000 flyers were distributed over these two days.
- Metro partnered with the California Institute of Technology to post on-campus meeting notices to publicize the Pasadena scoping meeting.
- Metro partnered with the University of Southern California to post notices on-campus to publicize the USC meeting. Notices were also forwarded to students in the School of Policy and Planning.
- The outreach team distributed bi-lingual meeting notices along 2nd Street within the Little Tokyo Service Center area.
- Capitalizing on new ways to communicate with a wider audience, Metro also established a "Regional Connector" Facebook page for the project. The Facebook page has over 100 members.
- The information phone line (213.922.7277) was monitored regularly.

2.5.3 Elected Official Briefing Meeting

A meeting was held with elected officials and/or their staff prior to the Public Scoping meetings. Typically, the briefing serves as a sounding board for the project team about the presentation, and provides these officials with notification about the upcoming meetings as well as preliminary information about the status of the project.

Time: Wednesday, March 25, 2009

Location: Metro
One Gateway Plaza, 15th Floor
Windsor Conference Room
Los Angeles, CA 90012

Attendees: Representatives from the following offices attended:

- Office of U.S. Senator Dianne Feinstein
- Office of U.S. Representative Dianne Watson
- Office of State Senator Fran Pavley
- Office of State Senator Alex Padilla
- Office of Assembly member Curren Price

- Office of Assembly member Felipe Fuentes
- Office of Los Angeles City Councilmember Jan Perry
- City of South Pasadena

Comments: Metro received oral comments from attendees at the meeting. Several attendees suggested that Metro highlight the potential benefits of the Regional Connector to communities outside downtown Los Angeles and to explain how this project fits in with Metro's other corridor studies running concurrently.

2.5.4 Public Scoping Meetings

Four public scoping meetings were scheduled in late March and early April 2009. Meetings were conducted in compliance with NEPA and CEQA guidelines, and locations were selected to reflect equitable geographic coverage, proximity to public transportation, and to minimize overlap with other meetings scheduled in the project area. For the convenience of all attendees, bus lines to and from the meeting sites were publicized on some notices. In order to provide the greatest opportunity for community participation, meetings were scheduled in the early evening on weekdays.

An approximate total of 175 people attended the scoping meetings, with approximately 82 persons providing verbal and/or written comments at the meetings. Approximately 45 additional comments were received after the meetings through letters and email.

Individual Public Scoping meeting details are as follows:

Meeting 1

Time: Monday, March 30, 2009, 4:30 – 6:00 PM

Location: Alumni Room, Davidson Conference Center
University of Southern California
3415 S. Figueroa Street
Los Angeles, CA 9007

Attendees: 24 (Sign-in sheet included in Appendix P)

Comments: 11 verbal, 10 written

Meeting 2

Time: Tuesday, March 31, 2009, 6:30 – 8:00 PM

Location: Lake Avenue Church
393 N. Lake Ave.

Pasadena, CA 91101

Attendees: 29 (Sign-in sheet included in Appendix Q)

Comments: 11 verbal, 2 written

Meeting 3

Time: Wednesday, April 1, 2009, 6:30 – 8:00 PM

Location: Japanese American National Museum (JANM)
369 E. 1st Street
Los Angeles, CA 90012

Attendees: 45 (Sign-in sheet included in Appendix R)

Comments: 12 verbal, 11 written

Meeting 4

Time: Thursday, April 2, 2009, 12 Noon – 1:30 PM

Location: Board Room
Los Angeles Central Library
630 W. 5th Street
Los Angeles, CA 90071

Attendees: 56 (Sign-in sheet included in Appendix S)

Comments: 11 verbal, 9 written

2.5.4.1 Public Meeting Format

The meeting format was as follows:

- 20 minutes: Open House
- 20 minutes: Presentation
- 50 minutes: Public Comment

The scoping meetings began with an open house format to provide attendees with an opportunity to review the project information prior to the start of the presentation and subsequent comment period. Project team members were present at the project display boards to answer questions related to the technical aspects of the project. A Spanish language interpreter was made available at all meetings, with a Japanese language interpreter

at the April 1, 2009 meeting. Following the open house period, a PowerPoint presentation was made to provide attendees with information regarding the purpose of scoping and information on the project purpose and need, background, the recently completed AA process, and the alternatives being carried forward into the DEIS/DEIR. Emphasis was placed on the importance of the community providing comments before the comment deadline, at the public meetings or via email, fax, or postal mail.

Following the presentation, attendees who completed speaker cards provided their verbal comments, which were recorded by a court reporter/transcriber. The oral comment period was moderated, and speakers were asked to limit their comments to two minutes. Those requiring translation were provided with four minutes. After the public comment portion of the meeting, the project team was again available to answer technical questions at the informational display boards.

2.5.4.2 Public Meeting Materials

The following items were distributed to meeting attendees in English, Spanish and Japanese.

- Agenda
- Scoping Packet
- Comment Form

Attendees were also invited to download a copy of the presentation made at the meetings from the Metro project website.

Copies of the boards displayed at the meetings as well as meeting handouts are included in Appendix T.

A copy of the Power Point presentation is included in Appendix U.

2.5 Comments Received

The public comment period for the DEIS/DEIR was from March 24 to May 11, 2009, which was greater than the required 45 calendar days. People had opportunities to comment in writing or orally at the four public scoping meetings or they could comment in writing via email, fax, or postal letter. Email comments could be sent either directly to the Metro project manager or via a project specific email address found on the project website. In total, approximately 126 comments were received by the May 11, 2009, scoping deadline:

- Approximately 47 persons provided oral comments and 32 written statements were submitted at the public scoping meetings
- Approximately 45 emails and letters were received during the public comment period

- All comments received are included in Appendices V and W

SUMMARY OF SCOPING COMMENTS

Metro accepted comments on the Regional Connector Transit Corridor Project throughout the entire scoping period, from March 24, 2009 until May 11, 2009. Agencies, community groups, members of the public, elected officials, and other interested parties submitted an approximate total of 126 letters, emails, comment cards, and individuals' oral testimony during this period. The summary table (Table 3-1) in Section 3.7 provides a tally of the topics discussed in the comments. It should be noted that the combined numbers of comments listed in the following subsections and the summary table will be greater than the total number of comment submissions because some commenters discussed multiple topics in their submission. Topics covered in the comments included the purpose and need, the range of alternatives to be analyzed in the DEIS/DEIR, potential impacts and mitigation measures, and other substantive issues. This section contains a summary of comments received during the scoping period. Full, unedited copies of the public comments and public scoping meeting transcripts are included in Appendix V and agency comments are in Appendix W.

3.1 Summary of Substantive Comments

All comments were reviewed and categorized in an electronic database. The database contains information documenting the name of the commenter, the agency or organization the commenter represents, the method by which the comment was received, the date the comment was received, the topic categories addressed in the comment, and the full text of the comment. The comments were largely fit into four topic categories. The major categories of comments were the project purpose and need (approximately 16 comments), the alternatives to be studied in the DEIS/DEIR (including track configuration, alignment options, station location options, and potential design features; approximately 151 comments), and environmental impacts and mitigation measures (approximately 139 comments). The following sections contain summaries of the comments from each major category.

3.2 Comments Related to Purpose and Need

Most comments regarding the purpose and need for the project cited the benefits of enhanced light rail connectivity and new stations in the downtown area. In total, approximately 16 comments related to purpose and need were received. The general topics that these comments addressed were:

- Making the light rail system connect better through downtown Los Angeles
- Making downtown Los Angeles more accessible from other Los Angeles neighborhoods
- Attracting new riders with improved transit service
- Reducing downtown traffic congestion

- Reducing transfers and shortening transit travel times
- Revitalizing the downtown area
- Timeliness of the project
- Promoting an alternative to driving
- Encouraging a pedestrian-friendly downtown
- Improving air quality
- Accommodating short headways on the light rail system
- Focusing on transit system quality
- Addressing capacity constraints of the light rail system, such as station crowding, before they become serious
- Expanding the rail transit system

3.3 Comments Related to Alternatives

An approximate total of 151 comments specifically discussed the alternatives. Several comments recommend alignment routes and design features that were studied in the AA, but not carried forward. Some comments mentioned other alignments, such as Alameda Street, which were included in prior connector studies, but were not studied in the AA because they did not meet the objective of connecting the light rail system through the central business district. Many commenters simply indicated a preference for particular alternatives without indicating reasons for their choices. Some comments citing potential environmental impacts (safety, noise, traffic circulation, etc.) as the basis for preference of an alternative are counted in both this section and Section 3.4.

3.3.1 No Build Alternative

Two comments mentioned the No Build Alternative. Both supported the No Build Alternative in light of the potential impacts of the other proposed alternatives.

3.3.2 TSM Alternative

Approximately five comments about the TSM alternative were received. One pointed out the shuttle buses' potential to improve circulation within the downtown area for senior citizens. One supported the TSM Alternative being implemented in conjunction with one of the LRT alternatives. The remaining comments did not mention any specific advantages or drawbacks.

3.3.3 At-Grade Emphasis LRT Alternative

Approximately 30 comments were received regarding the At-Grade Emphasis LRT Alternative. Less than 20 percent of the comments expressing an opinion about this alternative were in support of the At-Grade Emphasis LRT Alternative. Comments on this alternative included:

- Potential traffic impacts due to construction, reduced travel lanes as a result of the at-grade design, and the potential for stalled train operations to further disrupt traffic flows during operation
- Potential impacts to the regional system reliability from traffic congestion or potential collisions with cars or pedestrians which could interrupt service
- Potential safety concerns associated with at-grade train operations including the potential for emergency vehicle access to be hindered
- Potential impacts to rider mobility and inconvenient transfers due to the split station at 1st and Main and Los Angeles Streets
- Relative costs associated with operating the At-Grade Emphasis LRT Alternative compared to the Underground Emphasis LRT Alternative
- Potential impacts on vehicle access for specific buildings and the reduction in available turning radii with tracks running in the street.
- Potential visual impacts of at-grade LRT facilities
- Potential for the increased visibility of the at-grade system to attract more riders
- Potential economic impacts if the 2nd Street Tunnel becomes unavailable for filming
- Potential restriction of access to driveways and public buildings along 2nd Street

3.3.4 Underground Emphasis LRT Alternative

Metro received approximately 64 comments regarding the Underground Emphasis LRT Alternative. Over 80 percent of the comments expressed support for this alternative. Some commenters indicated specific concerns and/or potential benefits. These included:

- Potential for greater safety and reliability over an at-grade configuration
- Potential for fewer impacts on traffic circulation
- Potential for fewer impacts to downtown land uses and the potential for public/private joint development projects and other economic benefits to businesses on 2nd Street

- Potential for negative impacts on businesses in the Little Tokyo District and loss of businesses and parking at 1st and Alameda Streets
- Potential for negative impacts on traffic operations and intersection capacity at 1st and Alameda Streets as well as vehicle and freight access to buildings in this vicinity
- Several comments were related to the potential location and design of the station on 2nd Street
- Potential construction impacts associated with tunneling, such as detours for pedestrians and automobiles, noise, and loss of street parking
- Potential for easier pedestrian circulation compared to the other alternatives
- Potentially fewer visual impacts to the existing streetscape
- Discontinuation of direct service to East Los Angeles from Little Tokyo/Arts District Station
- Ability of the alternative to avoid disruption of Metro and LADOT DASH bus service
- Potential for the high volumes of trains at 1st and Alameda Streets to deter pedestrians and motorists from crossing, causing a division in the Little Tokyo neighborhood

3.3.5 Configuration

Approximately 25 comments were received regarding the potential configurations for the LRT tracks. Comments in this category did not specifically mention either of the build alternatives. Since both of the LRT alternatives include underground and at-grade segments, comments about configuration are relevant to both. Comments in this category were primarily related to the preference to grade separate the tracks from automobile traffic either by placing the system entirely underground or elevated. Commenters identified potential benefits to system reliability and speed and the potential to avoid impacts to traffic congestion or pedestrian circulation and safety from a grade separated configuration. Many comments suggest exclusively using one type of configuration (an entirely underground alignment, for example).

3.3.6 Station Locations and Connections

An approximate total of 25 comments suggesting new station locations were received, along with five comments about connections that the Regional Connector could make with other operating and planned transit services and activity centers at its stations. These comments relate to issues of accessibility and mobility within the project area and the regional system. The comments pertaining to station locations included:

- Suggestions for additional station locations:

- A second station at 1st and Alameda Streets, just east of the intersection, in order to facilitate transfers between the North-South and East-West LRT services.
- A station near 2nd and Spring Streets on the Underground Emphasis LRT Alternative
- At-grade station at Alameda and 7th Streets
- At-grade station at Alameda Street and Olympic Boulevard
- A station location close to the Civic Center
- A station at Temple and Judge John Aiso Streets on the At-Grade Emphasis LRT Alternative
- A station in the western portion of Little Tokyo
- A station near Weller Court
- An underground station on the Mangrove development site

- Alternate station location suggestions:
  - A station on 2nd Street between Los Angeles and San Pedro Streets instead of between Main and Los Angeles Streets on the Underground Emphasis LRT Alternative
  - Moving the station planned for 2nd and Hope Streets to 2nd Street and Grand Avenue
  - Replacing the existing Little Tokyo/Arts District Station with a larger underground station

Commenters suggested that the following connections be accommodated by the Regional Connector stations:

- Connection to the proposed Broadway Streetcar, potentially at the Underground Emphasis LRT Alternative station at 2nd and Los Angeles Streets
- Connections to the Grand Avenue Project and Historic Core
- Connections to additional bus service

- Convenient connections for bicycles and pedestrians at all stations

3.3.7 Other Alignments

Metro received approximately 11 comments suggesting alignments for the Regional Connector other than the At-Grade Emphasis LRT Alternative and the Underground Emphasis LRT Alternative. These suggested alignments are as follows:

- An alignment along 3rd Street from Flower Street to Little Tokyo
- An alignment following Alameda Street from Little Tokyo/Arts District Station to Washington Boulevard and then turning west to join the existing Metro Blue Line tracks
- An underground alignment on either 3rd Street or Temple Street instead of 2nd Street
- An alignment directly south from the Metro Gold Line bridge across the 101 freeway into a subway beneath 1st and Alameda Streets leading to the Underground Emphasis LRT Alternative's subway underneath 2nd Street

3.3.8 Design Features

Approximately 17 comments were submitted suggesting additional design features to be taken into consideration. Suggestions regarding design features were primarily related to issues of accessibility and mobility and potential visual and aesthetic impacts. These features include the following:

- Alternatives to the At-Grade Emphasis LRT Alternative's split stations at 1st and Main Streets and 1st and Los Angeles Streets to potentially reduce confusion and prevent missed connections
- Provide knock-out panels on the Underground Emphasis LRT Alternative to provide for future system connections at 2nd Street and Central Avenue to a southerly route on Central Avenue to Washington Boulevard, and at 2nd and Hope Streets to a route along Temple Street to Silverlake and Glendale
- Provide escalator access at CitiGroup Center Plaza into the proposed Underground Emphasis LRT Alternative station at 5th and Flower Streets
- Provide entrances and exits directly into nearby buildings at underground stations
- Building an underground split-level junction near 1st and Alameda streets instead of a single-level junction at-grade, so as to improve operations and avoid traffic impacts

- Double tracks (two tracks in each direction, for a total of four sets of tracks) or three sets of tracks to increase capacity
- Providing adequate capacity for transfers at Little Tokyo/Arts District Station
- Provide additional capacity beyond the provisions of either build alternative
- Include bicycle racks at stations
- Provide green space at stations
- Ensuring that the project complies with the Americans with Disabilities Act

3.4 Comments Related to Potential Impacts

Approximately 139 comments received pertained to specific potential impacts of the project. Commenters discussed a wide range of impacts, though the majority touched upon traffic circulation, safety, and construction impacts. The comments on each type of impact are summarized in the following subsections.

3.4.1 Transportation Impacts – Traffic Circulation

Metro received approximately 35 comments regarding potential transportation impacts and traffic circulation. Most of them expressed concern over the potential for increased traffic congestion as a result of construction and operation of at-grade LRT facilities. Comments included the following issues:

- Transportation impacts and traffic circulation comments pertaining to the At-Grade Emphasis LRT Alternative:
    - Potential impacts to traffic congestion on adjacent streets with the conversion of 2nd Street to primarily rail use under the At-Grade Emphasis LRT Alternative
    - Potential for the At-Grade Emphasis LRT Alternative to restrict access to driveways and public buildings along 2nd Street
    - Potential for at-grade LRT to worsen traffic congestion in the downtown area
- Transportation impacts and traffic circulation comments pertaining to the Underground Emphasis LRT Alternative:
    - Potential for worsened traffic due to the loss of parking on the lot bounded by 1st Street, Alameda Street, 2nd Street, and Central Avenue under the Underground Emphasis LRT Alternative

  - Compatibility of the Underground Emphasis LRT Alternative with the encouragement of a pedestrian-friendly downtown
  - Potential traffic capacity and operation impacts specifically to the intersection of 1st and Alameda Streets

- Transportation impacts and traffic circulation comments that do not pertain to a specific alternative:
  - Potential for the Regional Connector to alleviate traffic congestion in the downtown area
  - Potential impacts resulting in loss of both on and off-street parking
  - Potential to impact access to specific buildings for vehicle and freight due to changes in the current street capacity and configurations

3.4.2 Land Use and Development

Four comments about Land Use and Development impacts were received. The issues addressed in these comments include:

- Potential for the Underground Emphasis LRT Alternative to minimize long-term impacts on downtown land use, provide sites for possible public-private joint development projects, and compatibility with continued development of properties along 2nd Street
- Potential for transit-oriented development if an underground station is located on 2nd Street between Los Angeles and San Pedro Streets
- Foreclosing options for signature development in Little Tokyo neighborhood

3.4.3 Community and Neighborhood Impacts

Approximately ten comments were received concerning community and neighborhood impacts. The issues addressed by these comments included:

- Community and neighborhood impacts comments pertaining to the Underground Emphasis LRT Alternative:
  - Potential for the Underground Emphasis LRT Alternative to divide Little Tokyo at 1st and Alameda Streets due to the high volume of trains

  - Potential deterioration of quality of life in Little Tokyo due to the loss of businesses on the block bounded by 1st Street, Alameda Street, 2nd Street, and Central Avenue under the Underground Emphasis LRT Alternative
  - Potential for the Underground Emphasis LRT Alternative to reduce the developable size of Little Tokyo

- Community and neighborhood impacts comments that do not pertain to a specific alternative:
  - Potential impacts to the Little Tokyo and Arts District areas due to changes in traffic circulation and land use patterns
  - Potential for project facilities to force alteration of traditional parade routes
  - Potential for a grade separated alignment to have less of an impact on revitalizing neighborhoods than a non-grade separated alignment

3.4.4 Visual and Aesthetic Impacts

Approximately nine comments regarding visual and aesthetic impacts were received. Issues addressed by these comments include:

- Visual and aesthetic impacts comments pertaining to the At-Grade Emphasis LRT Alternative:
  - Potential for the high visibility of the At-Grade Emphasis LRT Alternative to attract more riders
  - Potential for at-grade LRT facilities to interrupt the streetscape to an unacceptable extent
- A visual and aesthetic impacts comment pertaining to the Underground Emphasis LRT Alternative:
  - Potential for the Underground Emphasis LRT Alternative to avoid visual street clutter
- Visual and aesthetic impacts comments that do not pertain to a specific alternative:
  - Potential impacts to the Little Tokyo and Arts District areas
  - Potential visual impacts of catenary poles on adjacent residences, particularly those located at the same level as the wires

- Request to incorporate sound urban design and public art into the project

3.4.5 Noise and Vibration

Approximately eight comments about noise and vibration were received. The issues addressed in these comments included potential noise impacts from train horns sounding when approaching grade crossings, noise and vibration from the trains moving along the tracks, potential damage to surrounding buildings due to construction vibration, and engine noise.

3.4.6 Historic Impacts

Four comments about historic impacts were received. The topics addressed by these comments included potential impacts to the historic Saint Vibiana Cathedral, the historic Higgins Building, and historic features along 2nd Street.

3.4.7 Parklands

Two comments regarding parklands were received. One suggested that parks be created adjacent to proposed stations, and another suggested converting the area above the proposed Alameda Street underpass to open space.

3.4.8 Economic and Fiscal Impacts

Approximately 11 comments concerning the economic and fiscal impacts of the project were received. These comments discussed the following issues:

- An economic and fiscal impacts comment pertaining to the At-Grade Emphasis LRT Alternative:
  - Potential for the At-Grade Emphasis LRT Alternative to eliminate revenue from filming in the 2nd Street tunnel due to the addition of tracks
- Economic and fiscal impacts comments pertaining to the Underground Emphasis LRT Alternative:
  - Potential loss of businesses due to construction of the portal at 1st and Alameda Streets for the Underground Emphasis LRT Alternative and subsequent potential effects on the long-term economic wellbeing of the Little Tokyo District
  - Potential for the Underground Emphasis LRT Alternative's removal of businesses and parking to devalue properties in Little Tokyo and lead to financial losses, and request for direct assistance to these businesses

- Potential for an underground configuration to avoid impacts to current and future businesses on 2nd Street
- Potential impacts to small businesses on 2nd Street between Los Angeles and Alameda Streets from potential traffic congestion and construction

- Economic and fiscal impacts comments that do not pertain to a specific alternative:
  - Potential impacts to retail business volume due to disruptions in pedestrian and vehicle flow patterns both during construction and post construction
  - Potential for the project to create jobs

3.4.9 Safety and Security

Approximately 27 comments related to safety and security were received. Topics addressed by these comments included:

- Safety and security comments pertaining to the At-Grade Emphasis LRT Alternative:
  - Potential for at-grade trains to collide with other vehicles or pedestrians
  - Potential for at-grade LRT facilities to compromise emergency vehicle and law enforcement access
  - Potential for the grade separated Underground Emphasis LRT Alternative to be safer than the At-Grade Emphasis LRT Alternative due to high volumes of motorists and pedestrians crossing 2nd Street
- A safety and security comment pertaining to the Underground Emphasis LRT Alternative:
  - Safety concerns for pedestrians and automobiles near the proposed Underground Emphasis LRT Alternative facilities at 1st and Alameda Streets
- Safety and security comments that do not pertain to a specific alternative:
  - Potential for overcrowding on station platforms or inadequate ingress and egress at Little Tokyo/Arts District Station due to increased ridership and additional transfers
  - Potential for security issues related to the proposed underpasses on each build alternative

- Potential security issues related to unauthorized pedestrian access into tunnel facilities
- Security considerations for public facilities near the potential stations and right-of-way
- Potential safety issues for vehicles and trucks turning in an out of buildings along streets with altered configurations and capacity
- Potential health risks posed by public transit vehicles
- Potential safety concerns of seniors and persons with disabilities
- Request that the hazard analysis study be complete and adequate

3.4.10 Construction Impacts

Approximately 18 comments about construction impacts were received. Topics covered by these comments included:

- Difficulty of making changes to an active revenue rail transit line without service disruptions and additional costs
- Potential impacts to traffic during construction
- Potential construction impacts from tunneling activities and the need to mitigate those potential impacts
- Potential impacts to building access during construction
- Potential impacts to businesses during construction
- Potential for construction vibration to damage buildings and property
- Order in which portions of the build alternatives are constructed

3.4.11 Growth Inducing Impacts

One comment about growth inducing impacts was received. It mentioned the potential for the Underground Emphasis LRT Alternative to generate public/private joint development opportunities.

3.4.12 Air Quality Impacts

One comment about air quality was received. The comment contains a request to analyze potential smog reductions generated by each proposed alternative.

3.4.13 Water Resources

One comment was received requesting that the analysis evaluate potential impacts to floodplains and that the project design be consistent with the National Flood Insurance Program requirements for new development.

3.5 Comments Related to Policy, Scoping, Operations, and Other Projects

Approximately nine comments pertaining to policy, the scoping process, operations, and other projects were received. Some of the topics covered by these comments included:

- Extending the operating hours of the Metro Rail system
- Revising Metro policies regarding transfers
- Creation of a downtown free fare zone
- Request for information about Metro Expo Line construction activities
- Request that the Scoping Report and EIS/EIR be adequate, respond to non-environmental comments, and be subject to critical review
- Request to maintain Metro Blue Line headways
- Suggestions for new rail projects

3.6 Comments Submitted by Federal, State, and Other Agencies

Seven agencies submitted comments during the scoping period. Most of the topics mentioned were also covered in the comments discussed in the previous sections. However, some of the agency comments presented new issues, including requests to ensure compliance with government-mandated policies, safety concerns, and warnings of potential access restrictions to various public buildings along the proposed alignments, among others. The agency comments are summarized in the following sections, and full text of the agency comments is provided in Appendix W. Many agencies also have regulatory authority over the design and construction of a rail project. The concerns of all the agencies will be addressed both through the DEIS/DEIR analysis and through on-going coordination with Metro.

3.6.1 Comments Submitted by Federal Agencies

The United States District Court submitted a comment that discussed topics listed in the previous sections as well as concerns about the At-Grade Emphasis LRT Alternative's impacts on access to the new Federal District Courthouse planned for the block bounded by 1st Street, Hill Street, Broadway, and 2nd Street.

The Federal Emergency Management Agency (FEMA) of the US Department of Homeland Security also provided comments related to the analysis that will need to be conducted in the DEIS/DEIR and the requirements for any proposed development within a floodplain. The Environmental Protection Agency provided additional comments regarding the issues to be analyzed.

3.6.2 Comments Submitted by State Agencies

The State of California Department of Transportation, the California Public Utilities Commission, and the California Native American Heritage Commission submitted comments discussing topics listed in the previous sections. They also emphasized the need to keep the public informed of the progress of the EIS/EIR study process and provided information on CEQA guidelines.

3.6.3 Comments Submitted by Other Agencies

The Los Angeles County Sheriff's Department, the City of Los Angeles Department of Transportation, the Community Redevelopment of the City of Los Angeles, and the City of Pasadena submitted comments covering some of the topics mentioned in previous sections, as well as:

- Request for traffic impact analysis
- Design and placement guidelines for stations, the alignment, and the surrounding streets
- Request for anticipated train speeds to be included in the EIS/EIR
- Application of the Federal Rail Administration's grade crossing policy
- Security of the At-Grade Emphasis LRT Alternative during protests in the Civic Center area

3.7 Comment Database

Table 3-1 provides a summary of the comments received during the scoping period. Transcripts of the spoken comments submitted at the public scoping meetings and full text of all written public comments are provided in Appendix V. Agency comments are provided in Appendix W.

Table 3-1 Comment Summary

Purpose and Need

Better light rail system connectivity downtown
More access between Los Angeles neighborhoods
Attracting new riders with improved transit service
Reducing downtown traffic congestion
Reducing transfers and shortening trip times
Revitalizing downtown
Timeliness of the project
Promoting an alternative to driving
Encouraging a pedestrian-friendly downtown
Improving air quality
Accommodating short headways on the LRT lines
Focusing on transit system quality
Addressing LRT system capacity constraints
Expanding the rail transit system

Extending the operation hours of the Metro Rail system
Revising Metro's transfer policies
Creation of a downtown free fare zone
Request for information about Metro Expo Line construction
Request that Scoping Report and EIS/EIR be adequate and respond to non-environmental comments

Note: Tallies and percentages are approximate

RESPONSES TO COMMENTS

4.1 Introduction

The purpose of scoping is to provide an opportunity for agencies and the public to comment on the purpose and need, the range of alternatives proposed for analysis, and to help the project proponent identify issues that should be evaluated in the DEIS/DEIR analysis. Therefore, all comments that fall within the scope of the NEPA/CEQA process will be addressed in the DEIS/DEIR. Metro will also continue to work closely with agencies and stakeholder groups to address issues identified through scoping.

4.2 Comments Related to Purpose and Need

There were no comments directly related to the stated purpose of the project. A number of comments did affirm many of the previously identified needs for the project. In addition, some commenters identified additional conditions or benefits that support the need for the project. The DEIS/DEIR will expand and clarify the purpose and need statement in response to these comments.

4.3 Comments Related to Alternatives

The Regional Connector project has completed an AA and conducted early scoping on the potential range of alternatives. The results of that report may be found in the Final AA Report (Metro 2009) and which is incorporated here by reference. The AA provides the reasoning for decisions regarding the identification and narrowing of the range of alternatives. The AA process identified an initial set of 36 conceptual alternatives that met the project purpose of improving connections within the light rail system through the central business district. These alternatives were screened against criteria related to constructability, right-of-way constraints, impacts of configurations, and operational concerns. This initial screening narrowed the range of alternatives to eight alternatives with a few variations on some of the alternatives. These eight alternatives were screened against the goals, objectives, and evaluation criteria established for the project. In addition, input from stakeholders, the public and agencies was solicited in the process of further narrowing the range of alternatives. The AA process resulted in four alternatives (two build alternatives, a No Build Alternative, and a TSM Alternative) that will be carried forward into the DEIS/DEIR.

Most commenters expressed a preference for one of the build alternatives. Comments that included reasons for a stated preference also provide insight into potential impacts or benefits of all of the alternatives. These insights into potential impacts are helpful in guiding the impact analysis of the DEIS/DEIR. Comments that provide this insight are also counted as a comment on a particular resource discipline and will be included in the analysis of potential impacts.

A few comments expressed a preference for an alternative that is not currently proposed for consideration in the DEIS/DEIR.

The DEIS/DEIR will summarize the alternatives previously considered and eliminated and the process used to do so. Other alternatives that do not meet the project purpose and need will not be evaluated further.

4.4 Comments Related to Potential Impacts

Potential impacts or benefits of alternatives identified by commenters will be analyzed in the DEIS/DEIR. Insights into how a particular alternative may affect traffic, neighborhoods, safety, or accessibility and mobility through the central business district are a valuable result of the scoping process. Specific comments on each potential impact will be used to guide the analysis of the alternatives.

Specific comments on potential impacts were related to traffic congestion, circulation, property access, mobility for segments of the ridership, safety, air quality, community and neighborhood, economic, historic resources, visual and aesthetic concerns, noise and vibration, land use and development, and construction activities.

4.5 Other Comments

A number of comments were received on matters related to Metro policies, operations, and other projects within the Metro system. These comments are beyond the scope of this DEIS/DEIR and have been relayed to Metro management for consideration in other, more appropriate forums.

Appendix B
Public Participation Plan

PUBLIC PARTICIPATION PLAN

I. Purpose and Background

The Regional Connector Transit Corridor Project area encompasses approximately 1.6 square miles of downtown Los Angeles within the boundaries of the I-110 freeway to the west, Alameda Street to the east, the US-101 freeway to the north, and 9th Street/Los Angeles Street and 7th Street to the South. It lies entirely within the City of Los Angeles limits in the central city area.

The Regional Connector Project is analyzing options for providing through service between Metro's Blue, Gold, Gold Eastside Extension and Expo Lines, and linking these rail corridors directly to Union Station by connecting the 7th Street/Metro Center station with the Little Tokyo/Arts District station, thereby providing a vital connection through downtown with other light rail service.

Completion of this connector line would provide a number of regional benefits including improved mobility, significantly reduced travel times, increased ridership, greater utilization of all rail lines and more accessibility to regional employment and cultural destinations. Construction of the Regional Connector Project would directly impact a 1.6 square mile geographic area in downtown Los Angeles, while its potential benefits accrue to transit users across the entire region. At the same time, the Regional Connector would also provide much-needed transportation alternatives for downtown Los Angeles's growing residential population and entertainment and cultural centers.

In January 2009, Metro's Board of Directors approved the Regional Connector Transit Corridor Alternatives Analysis Study and authorized staff to proceed with the next phase of the Project. This Draft Environmental Impact Statement (EIS)/ Environmental Impact Report (EIR)/Advanced Conceptual Engineering (ACE) phase follows the 12-month Alternatives Analysis that recommended two Build Alternatives for further study along with the No Build and Transportation System Management (TSM) alternatives. The Alternatives Analysis included an in-depth public participation process that included scoping meetings, community update meetings, key stakeholder meetings and elected officials' briefings, as well as development and dissemination of informational materials, a project website, project information line and media relations.

The Draft EIS/EIR phase of the Regional Connector LRT project will involve an extensive and inclusive community outreach process that builds upon, and enhances the public engagement efforts developed during the Alternatives Analysis phase of the project. This Public Participation Plan includes outreach not only to downtown Los Angeles stakeholders, but also to current and potential light rail riders; a wider population of transit users in Los Angeles County. This effort will also re-engage targeted stakeholder outreach efforts during the Alternatives Analysis while, at the same time, identify and involve potential new interested stakeholders who may now, more than before, have a special interest in this project. This Plan builds upon Metro's experience with the Alternatives Analysis, including lessons learned and identification of potential opportunity areas as well as Metro's best practices in public outreach.

II. Compliance with Federal Requirements (SAFETEA-LU)

The Transportation Equity Act for the 21st Century (TEA-21) was subsequently succeeded by the Safe, Accountable, Flexible and Efficient Transportation Equity Act – A Legacy for Users (SAFETEA-LU) on August 10, 2005 by Congress. TEA-21 and SAFETEA-LU continue the strong federal emphasis on public participation, requiring that the public participation plans of metropolitan planning processes "be developed in consultation with all interested parties and ... provide that all interested parties have reasonable opportunities to comment on the contents of the transportation plan". As outlined in the bill, methods to accommodate these goals, to the maximum extent possible, include:

- Holding any public meetings at convenient and accessible locations and times;
- Employing visualization techniques to describe plans;
- Making public information available in electronically accessible formats and means, such as the internet, as appropriate, to afford reasonable opportunity for consideration of public information.
- Coordinating local public participation/involvement processes with statewide public involvement processes wherever possible to enhance public consideration of the issues, plans, and programs, and reduce redundancies and costs.

SAFETEA-LU also expanded the definition of participation by "interested parties". Broadly defined it now includes as its partners, groups and individuals who are affected by or involved with transportation in the appropriate County and the surrounding region. Examples stated include citizens, affected public agencies, representatives of public transportation employees, private providers of transportation, representatives of users of public transportation, representatives of users of pedestrian walkways and bicycle transportation facilities, representatives of the disabled, and other interested parties with a reasonable opportunity to comment on the transportation plan.

SAFETEA-LU also requires that public meetings be held at convenient and accessible times and locations, that all plans be available by website and documents be written in easy, understandable language utilizing visual components.

This Public Participation Plan was developed cognizant of compliance with SAFETEA-LU.

III. Goals & Objectives of the Public Participation Process

The Public Participation Plan for the Regional Connector Transit Corridor Project provides an efficient, proactive and comprehensive guide to community outreach efforts throughout the DEIS/DEIR/ACE phase of this project. This Plan builds on the foundation of the public engagement effort developed during the Alternatives Analysis. The public involvement and consensus building effort for this project has several goals and objectives; it will:

- Utilize an inclusive outreach strategy that maximizes input from a broad range of project stakeholders;
- Provide forums for residents, businesses and community leaders to participate in the planning;

- Create multiple opportunities for the generation of ideas, comments and possible mitigation measures; and,

- Establish a forum for educating stakeholders on a regular basis as the project evolves.

The Public Participation Plan is in compliance with the public participation requirements of NEPA, CEQA and for the FTA New Starts program.

The intent of the public involvement process is to work cooperatively with the community toward the development of a preferred alternative that meets the purpose and need of the project.

Issues to be addressed during the DEIS/DEIR/ACE outreach process for the Regional Connector might include further development and refinement of the alternatives, locations of the stations, bus/rail interface and other transit issues, urban design, land use, neighborhood and community impacts, environmental impacts, and potential mitigation measures.

IV. Description of Public Participation/Involvement Activities

a. Schedule Overview

The 18 month schedule for the Draft EIS/EIR is summarized below. A series of community update meetings and formal public hearings will be held at key milestones. In addition, the project team will continue to meet with individual stakeholder groups. The public engagement effort will continue throughout the study as urban design proceeds and targeted stakeholders are involved in the planning process.

b. Stakeholder Identification & Community Profile

Metro will maintain and update the stakeholder database developed during the Alternatives Analysis to track interested individuals and groups, their areas of interest, communication, and other pertinent information for the duration of the project. Building on the database developed during the Alternatives Analysis phase of the study, Metro will continue to provide ongoing maintenance and updates to keep the database current.

The DEIS/DEIR phase will include extended outreach beyond Downtown Los Angeles, including all jurisdictions that potentially benefit from the Regional Connector. There are a variety of existing and potential new project stakeholders; many of these stakeholders were identified during the AA Study, and they will be further engaged during the DEIS/DEIR/ACE process. Stakeholders for this study include, but are not limited to:

- Local, County, Federal & State Elected Officials

- Neighborhood Councils, Associations and Community Councils

- Business and Labor Associations
- Retail & Entertainment Centers/Destinations
- Education, Cultural, Religious, Health Care Institutions along the existing and proposed alignment
- Transit Advocacy and Environmental Groups
- Public Agencies/Officials
- Cities along all existing and proposed alignments

Communication with individuals and organizations beyond the physical study area will be a priority during this phase given the regional significance of the project.

Further, building on information gathered during the Alternatives Analysis, Metro will develop a Community Profile, including an issues assessment, relevant to community participation in the study. The Community Profile will identify:

- key communities and constituencies in the study area;
- key communities and constituencies outside the study area, likely to benefit from the project;
- issues of special interest to communities and constituencies; and,
- strategies and actions to address these communities, constituencies, and issues.

In this way Metro will be able to monitor the issues and priorities of the distinct communities within and of relevance to the project in and beyond the study area.

c. Public Scoping Meetings, Community Updates and Public Hearings

c1. Facilitation of Draft EIS/EIR Scoping Meetings

Metro will conduct four (4) Public Scoping meetings, one (1) Agency meeting and one (1) briefing for local elected officials within the scoping period of the project to solicit comment and input for the DEIS/DEIR prior to the May 11, 2009 deadline for public scoping comments. For Public Scoping, two meetings will be held in Downtown Los Angeles, respectively one daytime meeting to accommodate those stakeholders working in the project area, and one evening meeting to ensure those living in the area are able to attend. Additionally, two more meetings will be scheduled in Pasadena, and the University of Southern California/South Park area: locations outside the project area where transit users will most benefit from construction of the Regional Connector.

The purpose of these meetings is to inform the public about the study, solicit input on the alternatives to be considered and identify issues and areas of concern that will need to be addressed in the DEIS/DEIR. These meetings will be recorded by a court reporter and documented as a part of the DEIS/DEIR/ ACE planning effort.

c2. Formal Public Meeting Coordination and Facilitation

Two rounds of community update meetings will be held during the Draft EIS/EIR and will coincide with key milestones. Metro will schedule and facilitate these public meetings, in up to five (5) locations, for a total of ten (10) community update meetings. A detailed summary of comments and meeting notes will be prepared after each round of meetings. Prior to each round of community update meetings, Metro will schedule one briefing for local elected officials. All presentation materials and meeting handouts will be posted to the Regional Connector website.

c3. Public Hearings

Metro anticipates four (4) public hearings, coordinated with the DEIS/DEIR formal public comment period and consistent with the California Environmental Quality act (CEQA), FTA, and National Environmental Policy Act (NEPA) guidelines. As for the scoping meetings, Metro will schedule a briefing meeting for elected officials prior to the hearings. TRG will be responsible for all logistics related to the hearings for the DEIS/DEIR phase, including schedule, location selection, staffing, presentation materials and handouts, meeting notifications and publicity, and securing a court reporter.

At the conclusion of the public hearings, Metro will develop a written summary which will include the number of attendees, major issues, and concerns raised, and recommended actions to address the issues. All written comments submitted at the public hearing and via email and US mail will be electronically scanned and included in the project documentation.

d. Other Meetings

Metro will proactively continue to coordinate with key project stakeholders groups in the area to engage them in the planning process. At the same time, Metro will respond to requests from community groups and other organizations to participate in their meetings.

e. Events

To reach out to those not active in civic issues or who do not typically attend community meetings, Metro will participate in local events such as festivals, fairs and other grassroots outreach opportunities. In addition to the events that Metro already participates in, other local opportunities to raise the project's visibility and awareness within the study area will be explored such as farmers markets, mall or shopping center booths and other more community-focused events.

f. Public Notice and Review

Public notices and meeting publicity for the Regional Connector will include:

- Placement of display advertisements two weeks prior to the scoping meetings in the Downtown News, Rafu Shimpo (English/Japanese), Garment & Citizen (Spanish/English), Pasadena Star News and the Daily Trojan
- Mail-out of scoping notice in English, Spanish and Japanese two weeks prior to the first scoping meeting to entire project database
- Mail-out of meeting notice to project database

- Email notification to all in the project database two weeks prior to first meeting, as well as email reminders for upcoming meetings two days prior to first meeting

- Post scoping meeting information on the Metro website (www.metro.net/ regionalconnector) two weeks in advance of meetings

- Update Regional Connector Facebook page and distribute meeting invitations via Facebook

- Placement of "Take One" meeting notices on Metro trains and buses serving the project area including the Metro Gold and Blue Lines, and on all downtown bus routes

- Distribution of meeting notices at key downtown Los Angeles gathering places such as the Central Library and Little Tokyo Branch Library, the lobbies of loft buildings and condos, and retail, restaurant and social service venues within the corridor

- Distribution of flyers at Union Station to promote the meetings

- Publicity of scoping meetings to be consistent with FTA requirements

- Development of Project Scoping Presentation Materials in multimedia, easy-to-understand, and multi-language formats

g. Written Materials

Metro will continue to develop text and visuals for collateral materials, specifically Mailers, Brochures, Fact Sheets, "Take Ones", Frequently Asked Questions (FAQs), and other pieces as needed, as well as a quarterly e-bulletin/newsletter. Materials will be translated, at minimum, into Spanish and Japanese and, as requested, Chinese and Korean. Metro will also develop an electronically, easy-to-read and quick-reference project e-bulletin/newsletter to be distributed approximately quarterly.

h. Website

The project website (www.metro.net/ regionalconnector) will be regularly updated to coincide with key milestones. In addition to serving as a source for public information, the website will also serve as a way to gather information. The webpage will facilitate ongoing database additions and provide a means for the community to provide input, ask questions, receive responses and distribute study materials. Metro will monitor web page use, track activity through the project database and respond to inquiries within one business day.

i. Media

Metro takes a proactive role working with the mainstream media to publicize all community meetings and to raise awareness of the Regional Connector Project. This includes the development of press releases and placement of display advertisements. This effort is complemented by outreach to grassroots, ethnic and niche print, broadcast and new media. For the DEIS/DEIR phase, Metro will outreach to wider media such as traffic reporters, as well as the Spanish, Chinese, Japanese and Korean-language media.

Metro will continue to utilize "new" media such as blogs, electronic news outlets, chat rooms, discussion boards, etc. to raise awareness of its projects. Metro will continue to use Facebook and other new media resources (social networking forums) to inform and educate project stakeholders about the study. A complete record of all blogging and other electronic communications on the project will also be maintained.

j. Tours

To help facilitate better understanding of light rail technology, configuration options and community integration, tours of the operational sections of Gold and Blue Lines as well as the construction section within downtown Los Angeles will be held as needed. Tours of other comparable non-Metro systems may also be appropriate.

k. Accommodations

All public meetings will be scheduled at locations accessible by transit users and all buildings for public events are ADA accessible for wheelchairs. Information regarding bicycle lockers/storage can also be researched upon request. Interpreters (language and hearing) or other auxiliary aids will be arranged if requested at least 3 days prior to the meeting.

V. Outreach to Traditionally Underserved Groups

Federal requirements for public participation plans include a process for seeking out and considering the needs of those traditionally underserved by existing transportation systems, such as low income and/or minority groups. Metro has actively worked with organized business and community groups in Little Tokyo and throughout downtown Los Angeles, contacted homeless service providers in the project area to inform them of community meetings, and will continue outreach efforts to transit users. In addition, materials are translated into Spanish and Japanese, and where requested into Korean and Chinese.

VI. Description of Committees Contributing to the Planning Process

Formation of Regional Connector Working Group

Metro will form a Working Group that will serve in an advisory capacity to the Regional Connector project team. This Working Group in intended to:

- Provide input and feedback at least key decision points
- Offer ongoing guidance about the progress of the project
- Complement the overall community-driven process
- Review the work completed by the geographic sub-groups described below
- Serve as a sounding board to the project team

Geographic Sub-groups within the Working Group, organized by approximate station locations to discuss issues of particular interest and/or concern to their neighborhoods will be created. These sub-groups will reflect the following geographic areas:

- Little Tokyo
- Bunker Hill
- Historic Core
- Financial District

Formation of a Technical Advisory Group

Metro will form a Technical Advisory Group comprised of various City of Los Angeles departments, as well as Los Angeles County, State and Federal agencies that will meet on an as needed basis.

VII. Public Participation Measures of Effectiveness

On a periodic basis, the Public Participation process will be reviewed to determine if modification of any particular strategy is necessary or if additional strategies need to be incorporated into the Plan to reach desired demographic groups.

Appendix C
Notice of Intent

received into any of our dockets by the name of the individual submitting the comment (or signing the comment, if submitted on behalf of an association, business, labor union, etc.). You may review DOT's complete Privacy Act Statement in the **Federal Register** published on April 11, 2000 (Volume 65, Number 70; Pages 19477–78).

Issued in Washington, DC on March 18, 2009.

Grady C. Cothen, Jr.,

Deputy Associate Administrator for Safety Standards and Program Development.

DEPARTMENT OF TRANSPORTATION

Federal Transit Administration

Intent To Prepare an Environmental Impact Statement for Proposed Transit Improvements in the Regional Connector Transit Corridor, Los Angeles, CA

AGENCY: Federal Transit Administration, DOT.

ACTION: Notice of intent to prepare an environmental impact statement.

SUMMARY: The Federal Transit Administration (FTA) and the Los Angeles County Metropolitan Transportation Authority (LACMTA) intends to prepare an environmental impact statement (EIS) for the Regional Connector Transit Corridor Project in Los Angeles County, California. LACMTA operates the Metro transit system in Los Angeles County. The proposed project would provide a direct link connecting several light rail service lines in operation or in construction through downtown Los Angeles, CA.

The project area lies entirely within the City of Los Angeles and is within the densely developed downtown core that includes multi-family residences, industrial and public lands, commercial and retail establishments, government office buildings, and private high-rise office towers.

The EIS will be prepared in accordance with the requirements of the National Environmental Policy Act (NEPA) and its implementing regulations. LACMTA will also use the EIS document to comply with the California Environmental Quality Act (CEQA), which requires an Environmental Impact Report (EIR). The purpose of this notice is to alert interested parties regarding the intent to prepare the EIS, to provide information on the nature of the proposed project and possible alternatives, to invite public participation in the EIS process (including providing comments on the scope of the Draft Environmental Impact Statement (DEIS), to announce that public scoping meetings will be conducted, and to identify participating and cooperating agency contacts.

DATES: Written comments on the scope of the EIS, including the project's purpose and need, the alternatives to be considered, the impacts to be evaluated, and the methodologies to be used in the evaluations should be sent to LACMTA on or before May 11, 2009 at the address below. See **ADDRESSES** below for the address to which written public comments may be sent. Public scoping meetings to accept comments on the scope of the EIS/EIR will be held on the following dates:

- Monday, March 30, 2009; 4:30 p.m. to 6 p.m.; at the University of Southern California (USC), Alumni Room, Davidson Conference Center, 3415 S Figueroa St, Los Angeles, CA 90007.
- Tuesday, March 31, 2009; 6:30 p.m. to 8 p.m.; at the Lake Avenue Church, 393 N Lake Avenue, Pasadena, CA 91101.
- Wednesday, April 1, 2009; 6:30 p.m. to 8 p.m.; at the Japanese American National Museum (JANM), 369 E 1st Street, Los Angeles, CA 90012.
- Thursday, April 2, 2009; Noon to 1:30 p.m.; at the Los Angeles Central Library, Board Room, 630 W 5th Street, Los Angeles, CA 90071.

The project's purpose and need and the description of alternatives for the proposed project will be presented at these meetings. The buildings used for the scoping meetings are accessible to persons with disabilities. Any individual who requires special assistance, such as a sign language interpreter, to participate in the scoping meeting should contact Ms. Ann Kerman, Community Relations Manager, LACMTA, at (213) 922–7671, or *kermana@metro.net*.

Scoping materials will be available at the meetings and on the LACMTA Web site (*http://www.metro.net/regionalconnector*). Paper copies of the scoping materials may also be obtained from Ms. Ann Kerman, Community Relations Manager, LACMTA, at (213) 922–7671, or *kermana@metro.net*. An interagency scoping meeting will be held on Thursday, March 26, 2009 at 1:30 p.m. at LACMTA, in the Gateway Plaza Room, One Gateway Plaza, Los Angeles, CA 90012. Representatives of Native American tribal governments and of all Federal, State, regional and local agencies that may have an interest in any aspect of the project will be invited to be participating or cooperating agencies, as appropriate.

ADDRESSES: Comments will be accepted at the public scoping meetings or they may be sent to Ms. Dolores Roybal Saltarelli, AICP, Project Manager, Los Angeles County Metropolitan Transportation Authority, One Gateway Plaza, Mail Stop? Los Angeles, CA 90012, or via e-mail at *roybald@metro.net*. The locations of the public scoping meetings are given above under **DATES**.

FOR FURTHER INFORMATION CONTACT: Mr. Ray Tellis, Team Leader, Los Angeles Metropolitan Office, Federal Transit Administration, 888 South Figueroa Street, Suite 1850, Los Angeles, CA 90017, phone (213) 202–3950, e-mail *ray.tellis@dot.gov*.

SUPPLEMENTARY INFORMATION:

Scoping

The FTA and LACMTA invite all interested individuals and organizations, public agencies, and Native American Tribes to comment on the scope of the EIS, including the project's purpose and need, the alternatives to be studied, the impacts to be evaluated, and the evaluation methods to be used. Comments should focus on: Alternatives that may be less costly or have less environmental or community impacts while achieving similar transportation objectives, and the identification of any significant social, economic, or environmental issues relating to the alternatives.

Project Initiation

The FTA and LACMTA will prepare an Environmental Impact Statement/Environmental Impact Report (EIS/EIR) for the Regional Connector Transit Corridor pursuant to 23 U.S.C. 139 and the California Environmental Quality Act (CEQA). LACMTA is serving as the local lead agency for purposes of CEQA environmental clearance, and FTA is serving as the federal lead agency for purposes of National Environmental Policy Act (NEPA) environmental clearance. This notice shall alert interested parties to the preparation of the EIS/EIR, describe the alternatives under consideration, invite public participation in the EIS/EIR process, and announce the public scoping meetings. FTA and LACMTA will invite interested Federal, State, tribal, regional and local government agencies to be participating agencies under the provisions of section 6002 of SAFETEA–LU.

Purpose and Need for the Project

The purpose of this project is to improve the region's public transit service and mobility. The overall goal of

the project is to improve mobility within the corridor by connecting to the light rail service of the Metro Gold Line to Pasadena, the Metro Gold Line Eastside Extension, the Metro Blue Line, and the Metro Expo Line. This link would serve communities across the region, allowing greater accessibility while serving population and employment growth in downtown Los Angeles. Mobility issues throughout the region and the identified need to join the unconnected segments of the light rail system have been documented in several past studies, including the *Pasadena—Los Angeles Light Rail Transit Project Environmental Impact Report* (1993), the *Blue Line Connection Preliminary Planning Study* (1993), and the *Regional Light Rail Connector Study* (2004).

Additional considerations supporting the need for the Regional Connector Transit Corridor project include: Increased travel times and station overcrowding occurring due to multiple transfers required to traverse the project area; a project area that has many transit dependent residents; poor system connectivity that results in reduced system schedule reliability as current system expansions are completed; and investments within the project area could improve system-wide operations in regards to travel times and safety issues.

Project Location and Environmental Setting

The proposed light rail transit (LRT) project lies entirely within the City of Los Angeles and is generally bounded by U.S. Highway 101 on the north, 7th and 9th Streets on the south, Alameda Street on the east, and State Route 110 on the west. Project length is just under two miles and the LRT alternatives would have up to four stations plus ancillary facilities including power substations. The project area is the largest regional employment center in Los Angeles County, and is densely developed with multi-family residences, industrial and public lands, commercial and retail establishments, government office buildings, and private high-rise office towers.

The proposed Regional Connector project would provide a direct link connecting several light rail service lines in operation or in construction (*i.e.*, the Metro Gold Line to Pasadena, the Metro Gold Line Eastside Extension, the Metro Blue Line, and the Metro Expo Line). The proposed project would create a connection in downtown Los Angeles that would link the Metro Blue and Expo Lines termini at 7th Street/Metro Center Station (7th Street and Flower Street) to the Metro Gold Line (Pasadena and Eastside) at the Little Tokyo/Arts District Station at 1st Street and Alameda Street. This connection would provide through service between the Metro Blue Line to Long Beach, the Metro Gold Line to Pasadena and East Los Angeles, and the Metro Expo Line to Culver City. With the implementation of the Regional Connector project, these four lines would share tracks and stations in downtown Los Angeles.

The various alternatives to be considered for the Regional Connector project generally traverse Flower Street north from 7th Street, 2nd Street between Flower and Alameda, Main and Los Angeles Streets between Temple Street and 2nd Street, Temple Street between City Hall and Alameda Street, and Alameda Street between U.S. Highway 101 and 2nd Street.

Alternatives

The Regional Connector Transit Corridor Final Alternatives Analysis Report (2009) prepared by LACMTA identified four alternatives for further consideration in the EIS/EIR. The four alternatives include: A No-Build Alternative, Transportation System Management (TSM) Alternative, At-Grade Emphasis LRT Alternative, and Underground Emphasis LRT Alternative.

No-Build Alternative: The No Build Alternative would maintain existing transit service through the year 2030. No new transportation infrastructure would be built within the project area aside from projects currently under construction, or funded for construction and operation by 2030 by recently approved Measure R sales tax. Bus transit service under the No Build Alternative would be focused on the preservation of existing services and projects. By the projection year of 2030, some bus service would have been reorganized and expanded to provide connections with the new rail lines; however, the transit network within the project area would largely be the same as it is now.

Transportation Systems Management (TSM) Alternative: The TSM Alternative would include the provisions of the No Build Alternative and add two shuttle bus routes from 7th Street/Metro Center station to Union Station providing a link between the region's unconnected LRT services, one along Grand Ave. and 1st St., and one along Figueroa, Flower, 2nd, and 3rd Streets. The shuttle buses would use existing bus-only lanes, where available, and would be fitted with transit-priority signalization devices similar to those used on Metro Rapid. Stops would be located every few blocks so as to provide full coverage of the area. Each shuttle route would be one and one-half to two miles in length.

At-Grade Emphasis LRT Alternative: This alternative would extend from the underground 7th Street/Metro Center Station, head north under Flower Street, surface to at-grade north of 5th Street, cross 3rd Street, enter Bunker Hill, and turn northeast through a new entrance to the existing 2nd Street tunnel. The alignment would continue along 2nd Street where it would split into an at-grade couplet configuration on Main and Los Angeles Streets (one track on each roadway) to Temple Street. Then it would head east on Temple Street and realign into a dual track configuration just north of the Metro Gold Line Little Tokyo/Arts District Station on Alameda Street. Due to the high volume of trains that would traverse the Regional Connector, an automobile underpass and pedestrian overpass would be constructed at the intersection of Temple and Alameda Streets to eliminate pedestrian-train and automobile-train conflicts.

There are two options for the configuration on Flower Street. For Option A, trains would transition to underground tracks after crossing 3rd Street and continue to a new underground station just south of 5th Street, then proceed to the 7th Street/Metro Center Station and arrive at the existing Metro Blue Line platform. For Option B, trains would arrive at an at-grade station after crossing 3rd Street, then transition to underground tracks near 4th Street to reach the existing Metro Blue Line platform at 7th Street/Metro Center station. In total, the At-Grade Emphasis LRT Alternative would add 1.8 miles of new double track to the light rail system.

In addition to the Option A and Option B Station configurations, other station locations would include a station adjacent to Bunker Hill, south of 2nd Street and Hope Street, and a split station using Main and Los Angeles Streets between 1st and Temple Streets. A fourth optional station on 2nd Street between Broadway and Los Angeles Street will be analyzed.

Underground Emphasis LRT Alternative: From the 7th Street/Metro Center Station, this alternative would extend north along Flower Street with a new underground station north of 5th Street. At 2nd Street, the underground tunnel would extend east with new underground stations to provide access to Bunker Hill and to the area between Los Angeles Street and Broadway. The tunnel would emerge to at-grade connections just southwest of the intersection of 1st and Alameda Streets.

At 1st and Alameda Streets, a new underpass would carry car and truck traffic along Alameda Street below the rail junction, and a new overhead pedestrian bridge structure would eliminate most conflicts between pedestrians and trains. This Alternative would have a single at-grade crossing at the intersection of 1st and Alameda Streets. The rest of the route would be underground. The length of this proposed route would be 1.6 miles.

Station locations for this alternative would all be underground and include the area north of 5th Street on Flower Street, adjacent to Bunker Hill just south of 2nd Street and 2nd Street between Los Angeles and Main Streets.

Probable Effects

The purpose of this EIS/EIR process is to study, in a public setting, the effects of the proposed project and its alternatives on the physical, human, and natural environment. The FTA and LACMTA will evaluate all significant environmental, social, and economic impacts of the construction and operation of the proposed project. Impact areas to be addressed include: transportation, land use, zoning and economic development, secondary development, land acquisition, displacements and relocations, cultural resources (including historical, archaeological, and paleontological resources), parklands/recreational facilities, neighborhood compatibility and environmental justice, visual and aesthetic impacts, natural resources (including air quality, noise and vibration, wetlands, water resources, geology/soils, and hazardous materials), energy use, safety and security, wildlife, and ecosystems. Measures to avoid, minimize, and mitigate adverse impacts will be identified and evaluated.

FTA Procedures

The regulations implementing NEPA, as well as provisions of the Safe, Accountable, Flexible, Efficient Transportation Equity Act: A Legacy for Users (SAFETEA–LU), call for public involvement in the EIS process. Section 6002 of SAFETEA–LU requires that FTA and LACMTA do the following: (1) Extend an invitation to other Federal and non-Federal agencies and Native American tribes that may have an interest in the proposed project to become ''participating agencies;'' (2) provide an opportunity for involvement by participating agencies and the public to help define the purpose and need for a proposed project, as well as the range of alternatives for consideration in the EIS; and (3) establish a plan for coordinating public and agency participation in, and comment on, the environmental review process. An invitation to become a participating or cooperating agency, with scoping materials appended, will be extended to other Federal and non-Federal agencies and Native American tribes that may have an interest in the proposed project. It is possible that FTA and LACMTA will not be able to identify all Federal and non-Federal agencies and Native American tribes that may have such an interest. Any Federal or non-Federal agency or Native American tribe interested in the proposed project that does not receive an invitation to become a participating agency should notify at the earliest opportunity the Project Manager identified above under **ADDRESSES**.

A comprehensive public involvement program and a Coordination Plan for public and interagency involvement will be developed for the project and posted on LACMTA's Web site (Regional Connector Transit Corridor Project Web page: *http://www.metro.net/regionalconnector*). The public involvement program includes a full range of activities including the project Web page on the LACMTA Web site, development and distribution of project newsletters, and outreach to local officials, community and civic groups, and the public. Specific activities or events for involvement will be detailed in the public involvement program.

LACMTA may seek New Starts funding for the proposed project under 49 United States Code 5309 and will, therefore, be subject to New Starts regulations (49 Code of Federal Regulations (CFR) part 611). The New Starts regulations also require the submission of certain project-justification information to support a request to initiate preliminary engineering. This information is normally developed in conjunction with the NEPA process. Pertinent New Starts evaluation criteria will be included in the EIS.

The EIS will be prepared in accordance with NEPA and its implementing regulations issued by the Council on Environmental Quality (40 CFR parts 1500–1508) and with the FTA/Federal Highway Administration regulations ''Environmental Impact and Related Procedures'' (23 CFR part 771). In accordance with 23 CFR 771.105(a) and 771.133, FTA will comply with all Federal environmental laws, regulations, and executive orders applicable to the proposed project during the environmental review process to the maximum extent practicable. These requirements include, but are not limited to, the environmental and public hearing provisions of Federal transit laws (49 U.S.C. 5301(e), 5323(b), and 5324); the project-level air quality conformity regulation of the U.S. Environmental Protection Agency (EPA) (40 CFR part 93); the section 404(b)(1) guidelines of EPA (40 CFR part 230); the regulation implementing section 106 of the National Historic Preservation Act (36 CFR part 800); the regulation implementing section 7 of the Endangered Species Act (50 CFR part 402); section 4(f) of the Department of Transportation Act (23 CFR 771.135); and Executive Orders 12898 on environmental justice, 11988 on floodplain management, and 11990 on wetlands.

Issued on: March 19, 2009.

Leslie T. Rogers,

Regional Administrator, Region IX, Federal Transit Administration.

[FR Doc. E9–6421 Filed 3–23–09; 8:45 am]

BILLING CODE 4910–57–P

DEPARTMENT OF TRANSPORTATION

Federal Transit Administration

Solicitation of Comments and Notice of Availability of Fiscal Year 2009 Funding for Transit Investments for Greenhouse Gas and Energy Reduction Grants

AGENCY: Federal Transit Administration, DOT.

ACTION: Interim notice of funding availability, request for comments.

SUMMARY: The American Recovery and Reinvestment Act of 2009 (ARRA) appropriated $100 million for a new discretionary grant program for public transportation projects that reduce a transit system's greenhouse gas emissions or result in a decrease in a transit system's energy use. Because of time limitations in ARRA funding, this notice announces the availability of the new grant program, application requirements, and deadlines for submitting grant proposals for funding. However, because the Transit Investments for Greenhouse Gas and Energy Reduction (TIGGER) program is a new grant program, FTA also is accepting comments on the program's provisions and may alter some of the requirements in response to comments.

DATES: Comments must be received by April 7, 2009. Late-filed comments will be considered to the extent practicable. Complete proposals for the TIGGER Grant Program must be submitted by May 22, 2009.

Appendix D
Notice of Preparation

LOS ANGELES COUNTY
METROPOLITAN TRANSPORTATION AUTHORITY (Metro)

NOTICE OF INTENT TO PREPARE AN ENVIRONMENTAL IMPACT STATEMENT (EIS)/ENVIRONMENTAL IMPACT REPORT (EIR)

TO: AGENCIES, ORGANIZATIONS & INTERESTED PARTIES.

SUBJECT: NOTICE OF INTENT (NOI)/NOTICE OF PREPARATION (NOP) OF AN EIS/EIR

PROJECT TITLE: REGIONAL CONNECTOR TRANSIT CORRIDOR PROJECT

PROJECT LOCATION AND ENVIRONMENTAL SETTING: The proposed light rail transit (LRT) project lies entirely within the City of Los Angeles and is generally bounded by US Highway 101 on the north, 7th and 9th Streets on the south, Alameda Street on the east, and State Route 110 on the west. The length of the proposed light rail project would be just under two miles. It would have up to four stations plus ancillary facilities including power substations. The project area includes the largest regional employment center of Los Angeles, and is densely developed with multi-family residences, industrial and public lands, commercial and retail establishments, government office buildings, and private high-rise office towers.

The proposed Regional Connector would provide a direct link connecting several light rail lines in operation or in construction, including the Metro Gold Line to Pasadena, the Metro Gold Line Eastside Extension, the Metro Blue Line, and the Metro Expo Line. The proposed project would create a connection through downtown Los Angeles that would link the Metro Blue and Expo Lines termini at 7th Street/Metro Center Station (7th Street and Flower Street) to the Metro Gold

Line (Pasadena and Eastside) at the Little Tokyo/Arts District Station at 1st Street and Alameda Street. This connection would provide through service between the Metro Blue Line to Long Beach, the Metro Gold Line to Pasadena and East Los Angeles, and the Metro Expo Line to Culver City. With the implementation of the Regional Connector, these four lines would share tracks and stations in downtown Los Angeles.

The various alternatives to be considered for the Regional Connector generally traverse Flower Street north from 7th Street, 2nd Street between Figueroa and Alameda, Main and Los Angeles Streets between Temple Street and 2nd Street, Temple Street between City Hall and Alameda Street, and Alameda Street between US Highway 101 and 2nd Street.

PROJECT INTITIATION: The Los Angeles County Metropolitan Transit Authority (LACMTA or Metro) and the Federal Transit Administration (FTA) will prepare an Environmental Impact Statement/Environmental Impact Report (EIS/EIR) for the Regional Connector Transit Corridor pursuant to 23 U.S.C. 139 and the California Environmental Quality Act (CEQA). Metro is serving as the local lead agency for purposes of CEQA environmental clearance, and FTA is serving as the federal lead agency for purposes of National Environmental Policy Act (NEPA) environmental clearance. This notice shall alert interested parties to the preparation of the EIS/EIR, describe the alternatives under consideration, invite public participation in the EIS/EIR process, and announce the public scoping meetings. FTA and Metro will invite interested Federal, State, tribal, regional and local government agencies to be participating agencies under the provisions of Section 6002 of SAFETEA-LU.

PURPOSE AND NEED FOR THE PROJECT: The purpose of this project is to improve the region's public transit service and mobility. The overall goal of the project is to improve mobility

within the corridor by connecting to the light rail service of the Metro Gold Line to Pasadena, the Metro Gold Line Eastside Extension, the Metro Blue Line, and the Metro Expo Line. This link would serve communities across the region, allowing greater accessibility while serving population and employment growth in downtown Los Angeles. Mobility issues throughout the region and the identified need to join the unconnected segments of the light rail system have been documented in several past studies, including the *Pasadena – Los Angeles Light Rail Transit Project Environmental Impact Report* (1993), the *Blue Line Connection Preliminary Planning Study* (1993), and the *Regional Light Rail Connector Study* (2004).

Additional considerations supporting the need for the Regional Connector Transit Corridor project include: increased travel times and station overcrowding occurring due to multiple transfers required to traverse the project area; a project area that has many transit dependent residents; poor system connectivity that results in reduced system schedule reliability as current system expansions are completed; and investments within the project area could improve system-wide operations in regards to travel times and safety issues.

ALTERNATIVES: The Regional Connector Transit Corridor Final Alternatives Analysis Report (2009) prepared by FTA and Metro identified four alternatives for further consideration in the EIS/EIR. The attached figures depict the No-Build, TSM, and two build alternatives proposed for further consideration. The four alternatives include:

No-Build Alternative: The No-Build Alternative would maintain existing transit service through the year 2030. No new transportation infrastructure would be built within the project area aside from projects currently under construction. Transit service under the No-Build Alternative would be focused on the preservation of existing services and projects. By the

projection year of 2030, some bus service would have been reorganized and expanded to provide connections with the new rail lines; however, the transit network within the project area would largely be the same as it is now.

Transportation System Management (TSM) Alternative: The TSM Alternative would include the provisions of the No-Build Alternative and add two shuttle bus routes from 7th Street/Metro Center station to Union Station, providing a link between the region's unconnected LRT services. One route would run along Grand Avenue and 1st Street, and one along Figueroa, Flower, 2nd, and 3rd Streets. The shuttle buses would use existing bus-only lanes, where available, and would be fitted with transit-priority signalization devices similar to those used on Metro Rapid. Stops would be located every few blocks so as to provide full coverage of the area. Each shuttle route would be one and one-half to two miles in length.

At-Grade Emphasis LRT Alternative: This alternative would extend from the underground 7th Street/Metro Center Station, head north under Flower Street, surface to at-grade north of 5th Street, cross 3rd Street, enter Bunker Hill, and turn northeast through a new entrance to the existing 2nd Street tunnel. The alignment would continue along 2nd Street where it would split into an at-grade couplet configuration on Main and Los Angeles Streets (one track on each roadway) to Temple Street. Then it would head east on Temple Street, realign into a dual track configuration east of Los Angeles Street, and join the Metro Gold Line just north of the Little Tokyo/Arts District Station on Alameda Street. Due to the high volume of trains that would traverse the Regional Connector, an automobile underpass and pedestrian overpass would be constructed at the intersection of Temple and Alameda Streets to eliminate pedestrian-train and automobile-train conflicts.

There are two options for the configuration on Flower Street. For Option A, trains would transition to underground tracks after crossing 3rd Street and continue to a new underground station just south of 5th Street, then proceed to the 7th Street/Metro Center Station and arrive at the existing Metro Blue Line platform. For Option B, trains would arrive at an at-grade station after crossing 3rd Street, then transition to underground tracks near 4th Street to reach the existing Metro Blue Line platform at 7th Street/Metro Center station. In total, the At-Grade Emphasis LRT Alternative would add 1.8 miles of new double track to the light rail system.

In addition to the Option A and Option B Station configurations, other station locations would include a station adjacent to Bunker Hill, south of 2nd Street and Hope Street, and a split station using Main and Los Angeles Streets between 1st and Temple Streets.

Underground Emphasis LRT Alternative: From the 7th Street/Metro Center Station, this alternative would extend north along Flower Street with a new underground station north of 5th Street. At 2nd Street, the underground tunnel would extend east with new underground stations to provide access to Bunker Hill and to the area between Los Angeles Street and Broadway. The tunnel would emerge to at-grade connections just southwest of the intersection of 1st and Alameda Streets. At 1st and Alameda Streets, a new underpass would carry car and truck traffic along Alameda Street below the rail junction, and a new overhead pedestrian bridge structure would eliminate most conflicts between pedestrians and trains. This alternative would have a single at-grade crossing at the intersection of 1st and Alameda Streets. The rest of the route would be underground. The length of this proposed route would be 1.6 miles.

PROBABLE ENVIRONMENTAL EFFECTS: The purpose of this EIS/EIR process is to study, in a public setting, the effects of the proposed project and its alternatives on the physical,

human, and natural environment. The FTA and Metro will evaluate all significant environmental, social, and economic impacts of the construction and operation of the proposed project. Impact areas to be addressed include: transportation, land use, zoning and economic development, secondary development, land acquisition, displacements and relocations, cultural resources (including historical, archaeological, and paleontological resources), parklands/recreational facilities, neighborhood compatibility and environmental justice, visual and aesthetic impacts, natural resources (including air quality, noise and vibration, wetlands, water resources, geology/soils, and hazardous materials), energy use, safety and security, wildlife, and ecosystems. Measures to avoid, minimize, and mitigate adverse impacts will be identified and evaluated.

SCOPING MEETINGS: Public scoping meetings to accept comments on the scope of the EIS/EIR will be held on the following dates: 1) Monday, March 30, 2009; 4:30 p.m. to 6 p.m.; at the University of Southern California (USC), Alumni Room, Davidson Conference Center, 3415 South Figueroa Street, Los Angeles, CA 90007; 2) Tuesday, March 31, 2009; 6:30 p.m. to 8 p.m.; at the Lake Avenue Church, 393 North Lake Avenue, Pasadena, CA, 91101; 3) Wednesday, April 1, 2009; 6:30 p.m. to 8 p.m.; at the Japanese American National Museum (JANM), 369 East 1st Street, Los Angeles, CA 90012; and 4) Thursday, April 2, 2009; Noon to 1:30 p.m.; at the Los Angeles Central Library, Board Room, 630 West 5th Street, Los Angeles, CA 90071. The project's purpose and need and the description of alternatives for the proposed project will be presented at these meetings. The buildings used for the scoping meetings are accessible to persons with disabilities. Any individual who requires special assistance, such as a translator or sign language interpreter, to participate in the scoping meeting should contact Ms. Ann Kerman, Community Relations Manager, Metro, at 213-922-7671, or kermana@metro.net.

Scoping materials will be available at the meetings and on the Metro website (www.metro.net/regionalconnector). Paper copies of the scoping materials may also be obtained from Ms. Ann Kerman, Community Relations Manager, Metro, at 213-922-7671, or kermana@metro.net. An interagency scoping meeting will be held on Thursday, March 26 at 1:30 p.m. at Metro, in the Gateway Plaza Room, One Gateway Plaza, Los Angeles, CA 90012. Representatives of Native American tribal governments and of all Federal, State, regional and local agencies that may have an interest in any aspect of the project will be invited to be participating or cooperating agencies, as appropriate.

COMMENT DUE DATE: Written comments on the scope of the EIS/EIR, including the purpose and need, the alternatives to be considered, the impacts to be evaluated, and the methodologies to be used in the evaluation should be sent to Metro on or before May 11, 2009 at the address below.

ADDRESSES: Written comments should be sent to Ms. Dolores Roybal Saltarelli, AICP, Project Manager, Los Angeles County Metropolitan Transportation Authority, One Gateway Plaza, Los Angeles, CA 90012, phone 213–922–3024, or e-mail roybald@metro.net. The locations of the scoping meetings are provided above, under SCOPING MEETINGS.

FOR FURTHER INFORMATION CONTACT: Ray Tellis, Team Leader, Los Angeles Metropolitan Office, Federal Transit Administration, 888 South Figueroa Street, Suite 1850, Los Angeles, CA 90017, phone 213-202-3950, e-mail ray.tellis@dot.gov.

City, CA 90zip

Re: Invitation to Participate in the Environmental Review Process for the Regional Connector Transit Corridor Project

Dear Mr. _____:

The Federal Transit Administration (FTA), in cooperation with the Los Angeles County Metropolitan Transportation Authority (LACMTA), is initiating the preparation of an Environmental Impact Statement/Environmental Impact Report (EIS/EIR) for the proposed Regional Connector Transit Corridor Project. The Regional Connector project proposes to provide a direct link through downtown Los Angeles that connects the Metro Gold Line to Pasadena, the Metro Gold Line Eastside Extension, the Metro Blue Line, and the Metro Exposition Line. The corridor extends for approximately 1.8 miles between the 7th Street/Metro Center Station and the Little Tokyo/Arts District Station.

The purpose of this project is to improve the region's public transit service and mobility. The overall goal of the project is to improve mobility within the corridor by connecting to the light rail service lines currently in operation or in construction through downtown Los Angeles. This link would serve communities across the region, allowing greater accessibility while serving population and employment growth in downtown Los Angeles. The enclosed scoping information packet provides more details including a preliminary schedule.

An Alternatives Analysis has been completed for this project and the final report may be found at http://www.metro.net/projects_studies/connector/final_alternatives_analysis_study.htm. Through the Alternatives Analysis process and with input from the public and agencies, the project area and the range of alternatives has been refined. The project area and alternatives identified in the Alternatives Analysis will be the subject of the Draft EIS/EIR.

Section 6002 of the Safe, Accountable, Flexible, Efficient, Transportation Equity Act: A Legacy for Users establishes an enhanced environmental review process for certain FTA projects, increasing the transparency of the process, as well as opportunities for participation. The requirements of Section 6002 apply to the project that is the subject of this letter.

As part of the environmental review process for this project, the lead agencies must identify, as early as practicable, any other Federal and non-Federal agencies that may have an interest in

the project, and invite such agencies to become participating agencies in the environmental review process.[1]

Your agency has been identified preliminarily as one that may have an interest in this project, because of the sensitive adjacent land uses, and facilities located in many parts of this corridor; accordingly, you are being extended this invitation to become actively involved as a participating agency in the environmental review process for the project.

As a participating agency, you will be afforded the opportunity, together with the public, to be involved in defining the purpose of and need for the project, as well as in determining the range of alternatives to be considered for the project. These opportunities will build on the early participation opportunities that were provided during the Alternatives Analysis process. In addition, you will be asked to:

- Provide input on the impact assessment methodologies and level of detail in your agency's area of expertise;
- Participate in coordination meetings, conference calls, and joint field reviews, as appropriate; and
- Review and comment on sections of the pre-draft or pre-final environmental documents to communicate any concerns of your agency on the adequacy of the document, the alternatives considered, and the anticipated impacts and mitigation.

Your agency does not have to accept this invitation. If, however, you elect not to become a participating agency, you must decline this invitation in writing, indicating that your agency has no jurisdiction or authority with respect to the project, no expertise or information relevant to the project, and does not intend to submit comments on the project. The declination may be transmitted electronically to Mr. Ray Tellis of our Los Angeles Metropolitan Office at ray.tellis@dot.gov; please include the title of the official responding. In order to give your agency adequate opportunity to weigh the relevance of your participation in this environmental review process, written response to this invitation are not due until after the interagency scoping meeting. The interagency scoping meeting will be held on the following date and location:

- Thursday, March 26 at 1:30 p.m. at LACMTA, in the Gateway Plaza Room, One Gateway Plaza, Los Angeles, CA 90012.

You or your delegate is invited to represent your agency at this meeting. Your agency will be treated as participating agency unless your written response declining such designation as outlined above is transmitted not later than April 13, 2009.

---

[1] Designation as a "participation agency" does not imply that the participating agency supports the proposed project or has any jurisdiction over, or special expertise concerning the proposed project or its potential impacts. A "participating agency" differs from a "cooperating agency," which is defined in regulations implementing the National Environmental Policy Act as "any Federal agency other than a lead agency which has jurisdiction by law or special expertise with respect to any environmental impact involved in a proposal (or a reasonable alternative) for legislation or other major Federal action significantly affecting the quality of the human environment." 40 C.F.R. § 1508.5.

We are providing scoping information materials with this letter that include description of the project area and proposed alternatives. The Scoping information is available at http://www.metro.net/projects_studies/connector. Additional information will be forthcoming during the scoping process. If you have questions regarding this invitation, please contact Ms. Dolores Roybal Saltarelli, AICP, Project Manager, Los Angeles County Metropolitan Transportation Authority, One Gateway Plaza, Los Angeles, CA 90012, email address roybald@metro.net.

Sincerely,

Roger Snoble

LACMTA CEO

Question/Answer Session 5

E X H I B I T S

(None)

Los Angeles, California, Thursday, March 26, 2009

1:30 p.m.

QUESTION/ANSWER SESSION

MR. GIBBS: With regard to the Little Tokyo Arts District station, so the above-ground is serving one direction and the below-the-ground is serving the other direction? There's --

MS. SALTARELLI: Right.

MR. GIBBS: -- no alternative that ends up serving both?

MS. SALTARELLI: Correct.

MR. GIBBS: And that's what the engineering work is so far? So that's an alternative that is impossible; correct?

MS. SALTARELLI: With that, we're open to questions, comments.

MR. TRAN: On the alternatives that you have here, do any of these alignments fall under MTA right-away or is this going to be on the City right-away?

MS. SALTARELLI: It's going to be on the city right-away.

MR. TRAN: Completely 100 percent; is that correct?

MR. BLAIR: City and private.

MR. TRAN: City and private?

MR. SOSA: That Metro has so far.

MR. TRAN: Is there any way we can get a couple of slides, a copy of your slide like this sheet (indicating) and the schedule one, make that available?

MS. SALTARELLI: If you signed in, we'll be able to send you the complete PowerPoint.

MR. TRAN: Curtis Tran.

MR. GIBBS: Curt Gibbs, CRA/LA's Downtown Region.

With regard to each of those alternatives, as for presenting at the scoping meetings, would you be able to show what the current anticipated cost of each one might be and what the currently anticipated funding sources might be for each of those alternatives?

MR. SOSA: During the environmental analysis, as we go through the next year and a half, that might change dramatically and the idea about presenting the scoping for what we know now for certain is so you can comment on something that's for certain. The costs may fluctuate and the funding sources may fluctuate.

So at this point, we're not prepared to show those at the scoping meeting, public scoping meetings.

We have shown them and presented them at the

Board meeting in January in the A.A. phase. So it'll change over time as we continue the analysis and during

the community meetings, we'll update the community on those particular aspects.

MR. JENKINS: This is Tom Jenkins.

They are available on the Alternatives Analysis Report, which is on the website.

MR. GIBBS: Right, but the numbers keep changing and the funding sources keep changing.

MR. BLAIR: There are no environmental consequences to our funding source.

MR. GIBBS: That's why I asked for an informational item.

MR. BLAIR: But we're going to keep working funding sources, but they do change; and especially since I think they are probably changing monthly and we're going to creatively keep giving you ones, but the ones we gave you

last week probably won't be the ones next week. We'll make it available as part of our normal process, but I don't know if it'll really be germane to this document.

MR. GIBBS: I just wanted --

MR. BLAIR: Curt, I will give you whatever you want, as you know.

MR. GIBBS: I appreciate it. Thank you.

MR. ALLEN: Shane Allen, L.A. Fire.

Is this project -- has this been approved? Is this funded? I mean --

MS. SALTARELLI: No. This is the first -- this is the second phase of the project development process and it's something that we need to do in order to select a project that we will construct and that we will fund.

MR. ALLEN: Well, where does it sit in the queue as far as there's a bunch of different projects that

everyone is talking about, Subway to the Sea, Phase Two Expo, Gold Line expansion, Downtown connector. What are its chances?

MS. SALTARELLI: This project is pretty dynamic in the fact that it closes a two-mile gap in our light-rail system and it's able to reduce transfers and really make a big difference for our system and transit riders.

Operationally, there's a great many benefits which I didn't mention, but we'll be able to connect to various yards that we can't do currently. It really addresses our need for expansion that will -- in terms of population and growth that we're going to be experiencing.

As I mentioned -- I might not have said that we're doing this in connection with the FTA and we have to go through what they call a New Starts Program. We're looking at them to be a partner to potentially fund 50 percent of this project.

Both of these alternatives, the at-grade and

underground, really fared well under their cost-effectiveness criteria. They have a threshold $25 and both of these are under that. So in terms of a project, it does a lot, considering that it's pretty concise and it's less than two miles.

MR. ALLEN: I think you left out probably the most important part of this project, is that it relieves the Seventh and Metro as being a permanent station that can't handle the population that it's been getting, but -- and how are they going to decide?

MR. BLAIR: We actually want you guys to write that part up, "This is definitely an essential thing for safety, fire-light safety, exiting and capacity." So we'll be asking you to speak loudly on that one.

MR. ALLEN: Absolutely. Where and how do you want it?

MR. BLAIR: We'll work with you to make sure it gets done.

MR. ALLEN: Okay.

MR. BLAIR: So you'd like it sooner than later? Is that what you're saying?

MR. ALLEN: Absolutely.

MS. SALTARELLI: And just to add, the regional connector was identified as one of the Measure R projects --

MR. ALLEN: Oh, good.

MS. SALTARELLI: -- so it is there.

MR. BLAIR: And that's in funding years, the early funding years, but there is a practical thing about Federal funding, and Charlene is here, so she's going to offer that. It certainly is a long-reach plan to be proposed. It's in the early stages, as funded by Measure R.

Sorry. I get excited.

MS. SALTARELLI: Comments?

MR. GREIN: Needless to say, there's large differences between at-grade and below grade.

MS. SALTARELLI: Excuse me. Can you say your name for the record.

MR. GREIN: I'm George Grein from the Sheriff's Department.

I do have a question having to do with if you're deciding to go with the at-grade, which is obviously the cheaper of the two solutions. What are you considering as far as at the grid crossings, for the purposes of making sure the trains get where they need to go on time without having any conflict?

Are there going to be -- is there something built into the project where there will be blockades, or is it going to be timed lights or how are you going to be

dealing with that potential, since they're going to be crossing at grade?

MS. SALTARELLI: Well, it's the at-grade alarm that is going to be street running and we'll allow Ray to

expand on that.

MR. SOSA: Yeah. We're going to look at everything we can do to make street running safe, of course, as well as make it as much a reliable system as you can make it for an at-grade system. Timing of the lights is part of that.

We work with the CPUC and Fire Department, Police Department on how we can accomplish that. It's too early to say that, you know, we're putting in grades AA. We have at-grade running segments where we don't utilize gates and we don't currently have that in the design, but throughout the entire process we'll have to go through and confirm that that's the solution to --

MR. GREIN: And that's one of the considerations, because the Eastside extension is going to go revenue and then they're going to put the gates in --

MR. SOSA: That hasn't been decided yet.

MR. GREIN: -- and I hope that something is learned from that, so that we can make a decision so something is done at the right timing.

MR. SOSA: Yeah. There are currently-operating

systems in L.A. County. The Eastside is opening right now, but the Blue Line runs their liner segments without gates as well, so they're -- and around the country, of course, we have segments without train gates. So there is a history of being able to run a light-rail train safely in urban areas.

MR. BLAIR: Which have led to the Environmental Impact.

MR. SOSA: Yeah.

MS. SALTARELLI: Yes.

MR. GIBBS: Curt Gibbs from CRA. With regard to the Little Tokyo Arts District station, those transfers involving one underground and the other aboveground, would the EIR address how people would end up having to transfer as it would be attempting to either come from the Eastside, because they can't transfer, as to how people would actually behave so we understand what Metro is expecting? Will they include that in the analysis?

MR. SOSA: I'm sorry. What was the question?

MS. SALTARELLI: Our operational plan --

MR. JENKINS: Tom Jenkins.

We will know what the number of transfers are.

MR. GIBBS: But the question is --

MR. JENKINS: We will address that.

MR. GIBBS: -- the behavior of people, how do -- you

know, how will people -- will people go all the way to Union Station and make the transfer or switch there, or will they go -- are they going to go, let's say, to the station on Second and Main and make the transfer there and back?

I'm just curious what the thought process is, because it's -- you know, this is a real trade-off because you can't address it from an engineering fashion and people are incompetent, so you're going to have to predict people's behavior. I mean, I think the CRA went

on record, We're real concerned about that station not being both ways. So --

MR. JENKINS: Yeah.

MS. SALTARELLI: In the document itself, we'll be addressing from an operational plan for each of the alternatives to say that -- we'll go into detail about exactly where you need to transfer. We are going to go into that level of detail.

MR. SOSA: Yeah. Yes. Absolutely.

MR. JENKINS: Yes.

MS. SALTARELLI: So the public will have, you know, full disclosure as to how they're going to operate.

MR. POOSTI: Ali Poosti, Bureau of Sanitation.

I'd like to know what the depth is underground that we'll be running.

MS. SALTARELLI: Well, with some stations, the

question is how far down some of the stations will be. For Bunker Hill, it will be quite deep. We're looking at about 130 feet down. Some -- for the underground, we'll have to be underneath the Red Line. So certain areas are going to be quite deep.

MR. ROY: It's on average about 60 to 70 feet average of the tunnel, but the stations will be -- the stations will be higher.

MR. JENKINS: 40 to 50.

MR. ROY: 40 feet.

THE REPORTER: I'm sorry. What is your name, sir?

MR. ROY: Gyrish Roy from Metro.

MR. GIBBS: Just to follow up -- Curt Gibbs with CRA -- with regard to that Bunker Hill station, is it -- is it -- can it be in the EIR as to an exact location of that station?

MS. SALTARELLI: Yes.

MR. GIBBS: So is it going to be underneath CRA's properties?

MS. SALTARELLI: No.

MR. ALLEN: Shane Allen, L.A. Fire.

I have one more question on the intersection. How are -- what's the proposed method to regulate that

intersection where you're going to have the two alignments meet?

MS. SALTARELLI: At First and Alameda?

MR. SOSA: For the underground?

MR. ALLEN: Yes.

MS. SALTARELLI: Sorry. Let me just get that up there. Somehow I bypassed it.

MR. SOSA: Do you want me to answer?

MS. SALTARELLI: Sure.

MR. SOSA: We have a concept that we talked about, but we're going to have to work with LADOT and Fire and everybody on that particular intersection because we have a lot of activity. That's the reason why we included the underpass at Adams.

We'll still have to maintain a frontage road for the subroid development that's on the east side of Alameda, and then there's also a road, right now in terms

of our concept, next to the Japanese American National Museum and because they have an entrance and exit as well.

So far, our design meets the standards, the typical standards, but definitely we have to go through the process of working with everybody during this EIR, the draft of the report. And in addition to that, we have the pedestrian bridge as well. We may restrict pedestrians to move in certain areas across the street.

You know, all that will be detailed after hearing your comments and then working with the industry.

MR. ALLEN: Yeah, because there's a lot right next -- you know, right next to the station there that you could bring a portal up out of the ground and not affect any of that and then just tie it into the bridge going up.

MR. SOSA: Which lot is that?

MR. ALLEN: Just east of the station there.

MR. SOSA: The northeast station? That's the private-company development which has been very active in trying to get development there for the community, and last year the City awarded the development of that site and we're coordinating with them so that there are opportunities to do something like that. But right now we've designed it so that we're not dependent upon the site.

There are issues with doing that which we looked at during the A.A. process as well. There are traffic issues, because your trains have to get into that property to be able to get underneath First and Alameda, which makes that property very difficult to utilize, from the development standpoint.

In addition, we'd have to remove the Little Tokyo Arts District station if we were to do that. So then the community -- when we presented that to the

community as well, they were not in favor of having that station removed.

MR. ALLEN: Well, it would be two separate alignments, wouldn't it?

MR. SOSA: If we had an opportunity to use the property, there may be other ways to go about it, but we're willing to work with them if they're able to allow us to do that.

MR. GREIN: George Grein of the Sheriff's.

What's the thought process you were mentioning about somebody could ride all the way from one point to another without having to get another ticket? How's that going to work? Is that a terminal at First and Alameda or would the rider continue on on the Gold Line extension?

MS. SALTARELLI: Uh-huh.

MR. GREIN: So, in other words, you're going to have the line coming out of Union Station and the line coming through the Downtown connector coming together at that point and the same thing at Seventh and Metro?

MS. SALTARELLI: Possibly. Well, keep -- the initial operating plan is you would be coming from Pasadena,

leaving Union Station -- this would be for the underground alignment -- going to the Little Tokyo Arts District and then going through Downtown; and depending

on which train you're on, you would either go down to Pasadena or -- sorry -- to Long Beach. And then coming back up, you would again have to be on the right train and you would either be going back up to Pasadena or then you would be going to the Eastside.

MR. GREIN: So the existing Gold Line extension, Gold Line -- sorry. The existing Gold Line would be the line you're talking about, and that becomes -- it goes through Downtown, and the East L.A. is a separate line coming in, both using that one short distance?

MS. SALTARELLI: Yes.

MR. GIBBS: You know, that's always been confusing. When you're doing your scoping meetings, maybe you should

just do a slide that really lays it out so people understand when they're coming from Long Beach that these are their choices as to which direction you go, depending on the alternative, so it's really laid out very clearly for everyone, 'cause it's hard to keep track of it.

MR. JENKINS: Yeah. I think if it provides a lot of flexibility -- Tom Jenkins -- a lot of flexibility, but you have to explain how people would use it on that. But, I mean, you could go -- as an example, we're talking about if you were in Downtown Pasadena.

Let's say you got onto the Pasadena line, the Gold Line, and you wanted to go to L.A. Live as an

example. That would be, in essence, one seat. You'd sit down and you'd get off at Pico. Right now, to do that, you would have to transfer twice and that gets to what we've talked about in one of the benefits, is reducing our problems at this station and at Seventh and Metro

with the transfer issues.

So -- and right now, if you pay cash fare, that would cost you $3.75 to do that under the current fare structure. Under this, it would be $1.25 under the current fare structure, but there's a lot of benefits to the rider not only in time but costs, and there's operational efficiencies in there because of reducing our issues at Union Station and Seventh and Metro, not just moving people up and down the corridors to get them back and forth to trains.

MR. GIBBS: So would you have time to do another Board like that, a summary board? I think it really helps people understand what each of these alternatives means, especially for those that actually ride the rail system. MR. BLAIR: You know, the San Francisco system has a series of colored lines that overlap each other and, Curt, if we're not explaining it clear, we've got to do it better. So the answer is we'll work on it on this site.

MR. JENKINS: This way, the basic operating plan is

if you lived on the Eastside in Boyle Heights and you wanted to, say, go to USC, if you were to go to school there or L.A. Trade or more to USC, that would be a single ride across Downtown on that, clear to the USC station, or go clear to Santa Monica when Expo phase two is up.

And even from Pasadena, it would only be one transfer from that. You could come from Pasadena and come down. You might -- and you could transfer at any of those stations in Downtown. You don't have to transfer at Seventh and Metro or Union Station. You could transfer at the one at Bunker Hill and catch the train out to Santa Monica. So you have to have -- that's where you were talking about where you might transfer. There's many opportunities to do the transfer to sort of spread the grief of the transfer, and some might be easier than others, but in Downtown those trains would each run five-minute headways. Combined, you would have two-and-a-half -- every two-and-a-half minutes, you'd see

a train coming through Downtown.

MR. GREIN: Just a clarification. George Grein again. If you're coming from the Eastside from the soon-to-be-built Gold Line extension, if you're coming from Boyle Heights and you want to go to SC, it's still going to be a connection at First and Alameda; correct?

MS. SALTARELLI: No.

MR. JENKINS: No. You'd go straight through.

MR. GREIN: So we've got some trains --

MR. JENKINS: If you got on the train at Boyle Heights, and the concept that we had laid out on the first or second slide there, the east-west line, you would get on that train and the next time you want to get off of it would be at SC.

MR. GREIN: So what you're saying is that, what, every other train would be doing that and the other half --

MR. JENKINS: No.

MR. GREIN: -- is going to be going to Union Station?

MR. JENKINS: No. In this operation --

MR. GREIN: I'm confused.

MR. JENKINS: -- you would not be able to go to Union Station, coming from the Eastside, in this concept.

MR. BLAIR: I think, George -- if I can, whatever we're operating today, once the original connector is in, it will operate differently.

MR. JENKINS: It will operate differently.

MR. GIBBS: That's something people don't realize.

MR. JENKINS: I know what you mean and right now --

MR. GREIN: And I'm familiar with the system and I'm confused, 'cause I don't know how they're going to do

that connection.

MR. JENKINS: If you go back -- and remembering doing

the Red Line extension to the Eastside, that's what it would be.

MR. GIBBS: You doing that, do the colors of the lines have to change?

MR. BLAIR: I think we'll have to redefine the system, but the easiest way to make this issue clear, we are going to run, based upon this environmental document, a north-to-south run and an east-to-west run. That's it. We have the options and the flexibilities of doing all kinds of things; but for practical purposes, it's Pasadena to Long Beach and it's East L.A. to the Westside, and those are the two lines. In the middle you've got four or five opportunities to change any time you want, but there's no one station you have to change at. We're going to overlap several of them.

As you mentioned, Shane, we've got some concerns now at Seventh and Metro now for transferring. This will allow us to disburse some of those populations to four or five other stations. This is a chance to do that, work through a few. But what we operate today is different than what we're going to operate once the system is in place.

The huge advantage that has been mentioned, this

is fast. Instead of 20-minute transfer times for various locations, you can sit down one time to get to your destination and save yourself anywhere from 10 to 20 minutes or so per direction. So if you're doing this every day, that's somewhere between 20 and 40 minutes transportation time saved every single day. So the whole system runs faster, it runs quicker north, south, east, west, and the operations are better.

MS. SALTARELLI: And I would like to add that this is our initial operating plan. As I mentioned earlier, we're going to have a lot of changes in the next 20 years. The regional connector closing the gap in the light-rail system gives us a lot of flexibility and we can change our operating plan based on what our needs are, so that's the beauty of this project.

Any other questions?

Well, as a conclusion -- thank you -- I'd just

like to remind everybody to please submit comments to us during the scoping period, which ends on May 11th. As I said earlier, we're going to engage you throughout this process. If you have any questions, comments, you know, outside of May 11th, please call me and, you know, we look forward to working with you during this phase of the project. Thank you.

And just to add, you know, please sign in and

we'll be sending everybody a copy of the presentation. So thank you very much.

(Proceedings concluded at 2:10 p.m.)

Meeting Boards and Scoping Packet

Welcome!

Thank you for attending this public scoping meeting for the Regional Connector Transit Corridor project. The public scoping meetings start the Draft Environmental Impact Statement/Environmental Impact Report (DEIS/DEIR) process.

Agenda

- Open House – 20 Minutes
- Formal Presentation – 20 Minutes
- Public Comment Period – 60 Minutes

Project Purpose

The project purpose is to improve the region's public transit service and mobility by providing a connection through downtown Los Angeles that links the region via the Metro Gold Line to Pasadena and East Los Angeles, Metro Blue Line to Long Beach, and Metro Expo line to Culver City.

- Support Community Planning Efforts
- Public Involvement and Community
- Improve Local and Regional Mobility and Accessibility
- Provide a Cost Effective Transportation Alternative
- Provide a Financially Feasible Project
- Provide a Safe and Secure Transportation Alternative

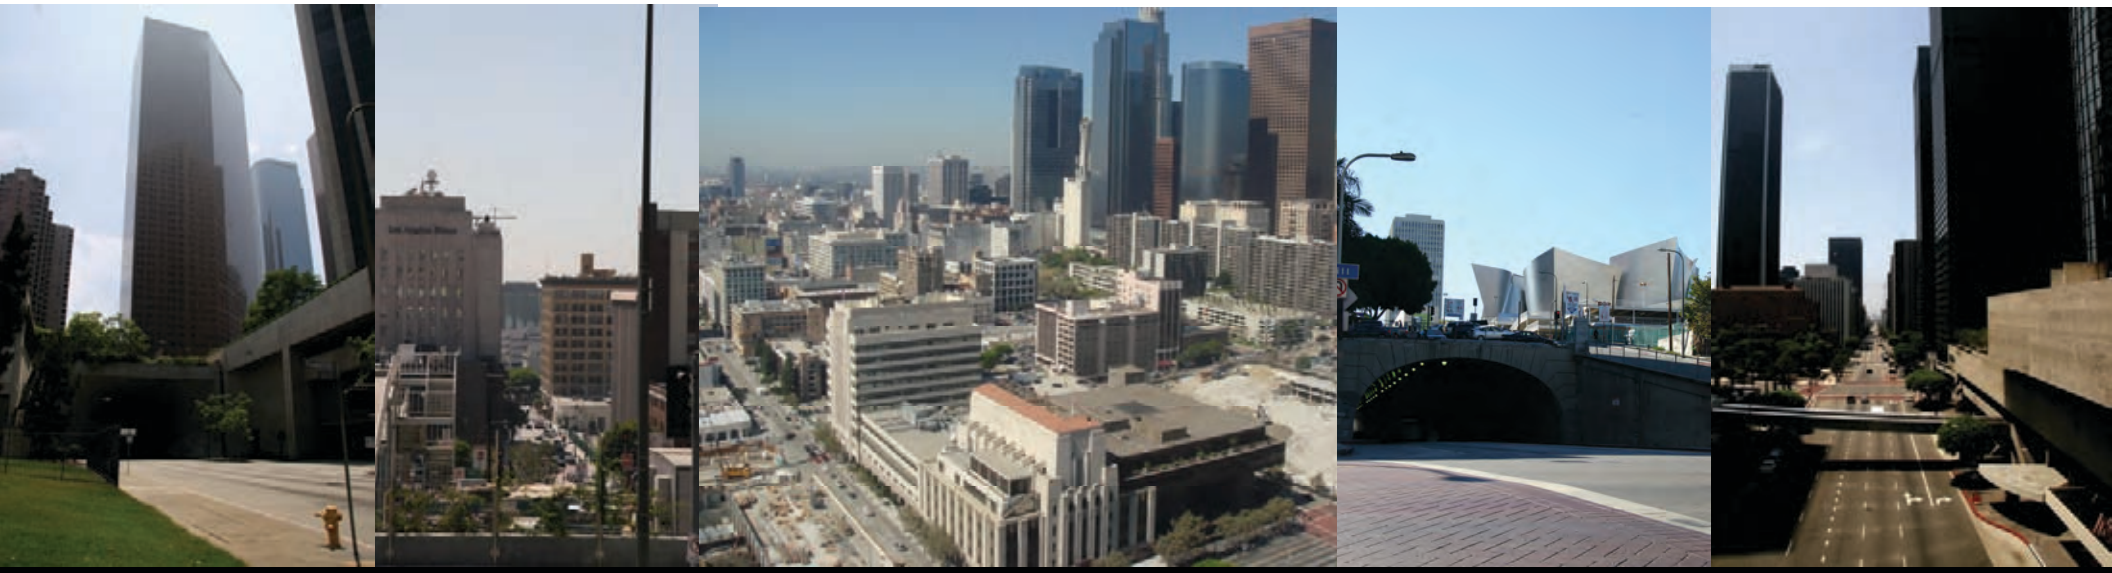
Project Need

- Multiple transfers to travel across downtown result in overcrowding at stations and increased travel times
- Project area has many transit-dependent residents
- As the Metro Expo Line and Metro Gold Line Eastside Extension are completed, the lack of regional connectivity may result in reduced schedule reliability
- Improved system-wide operations could result in improved travel times and safety throughout the entire system
- Employment & residential growth and traffic congestion in the region expected to increase over the next 20 years

Environmental Issues to be Analyzed

The purpose of the DEIS/DEIR is to study the potential effects of the construction and operation of the proposed project alternatives. Measures to avoid, minimize, and mitigate adverse impacts will be identified and evaluated.

- Traffic, Transit & Parking
- Visual & Aesthetics
- Air Quality
- Cultural/Historic Resources
- Safety & Security
- Geology & Soils (Subsurface & Seismic)
- Water Resources
- Biological Resources
- Noise & Vibration
- Energy Use
- Hazardous Materials
- Parks & Other Community Facilities
- Land Use
- Displacement/Relocation of Uses
- Community Impacts
- Economic Development
- Fiscal Impacts
- Environmental Justice
- Growth Inducing Impacts



Mode: Light Rail Transit (LRT)

- At grade, below grade
- Exclusive lane
- Overhead electrical power
- Up to 55 mph/up to 35 mph or posted speed if street running
- Up to 3 cars/train
- Up to 500 passengers/train
- Approximately one mile station spacing (closer in urban areas)
- Approximately 270-foot long high platform stations

Regional Connector Transit Corridor Study

SCOPING INFORMATION PACKET

Project Description

The proposed Regional Connector Transit Corridor project would provide a direct link connecting several light rail lines in operation or in construction, including the Metro Gold Line to Pasadena, the Metro Gold Line to East Los Angeles, the Metro Blue Line to Long Beach, and the Metro Expo Line to Culver City. The proposed project would create a connection through downtown Los Angeles that would link the Metro Blue and Expo Lines termini at 7th Street/Metro Center Station (7th Street and Flower Street) to the Metro Gold Line at the Little Tokyo/Arts District Station at 1st Street and Alameda Street. With the implementation of the project, these four lines would share tracks and stations in downtown Los Angeles. The project corridor length varies slightly by alternative and is approximately 1.8 miles long.

Project Purpose and Need

The purpose of this project is to improve the region's public transit service and mobility. The overall goal of the project is to improve mobility within the corridor by connecting to the light rail service of the Metro Gold Line to Pasadena, the Metro Gold Line to East Los Angeles, the Metro Blue Line, and the Metro Expo Line. This link would serve communities across the region, allowing greater accessibility while serving population and employment growth in downtown Los Angeles.

Additional considerations supporting the need for the Regional Connector Transit Corridor project include: increased travel times and station overcrowding occurring due to multiple transfers required to traverse the project area; a project area that has many transit dependent residents; poor system connectivity that results in reduced system schedule reliability as current system expansions are completed; and investments within the project area could improve system-wide operations in regards to travel times and safety issues.

Proposed Alternatives

The Regional Connector Transit Corridor Final Alternatives Analysis Report (2009) prepared by the Los Angeles County Metropolitan Transportation Authority (Metro) identified four alternatives for further consideration in the DEIS/DEIR. The four alternatives include: a No-Build Alternative, Transportation System Management (TSM) Alternative, At-Grade Emphasis Light Rail Transit (LRT) Alternative, and Underground Emphasis LRT Alternative.

No Build Alternative

The No Build Alternative would maintain existing transit service through the year 2030. No new transportation infrastructure would be built within the project area aside from projects currently under construction, or funded for construction and operation by 2030 by the recently

approved Measure R sales tax. Bus transit service under the No Build Alternative would be focused on the preservation of existing services and projects. By the projection year of 2030, some bus service would have been reorganized and expanded to provide connections with the new rail lines; however, the transit network within the project area would largely be the same as it is now.

Transportation Systems Management (TSM) Alternative

The TSM Alternative would include the provisions of the No Build Alternative and add two shuttle bus routes from 7th Street/Metro Center station to Union Station, providing a link between the region's unconnected LRT services. One route would run along Grand Avenue and 1st Street, and one along Figueroa, Flower, 2nd, and 3rd Streets. The shuttle buses would use existing bus-only lanes, where available, and would be fitted with transit-priority signalization devices similar to those used on Metro Rapid. Stops would be located every few blocks so as to provide full coverage of the area. Each shuttle route would be one and one-half to two miles in length.

At-Grade Emphasis LRT Alternative

This alternative (**Figure 1**) would extend from the underground 7th Street/Metro Center Station, head north under Flower Street, surface to at-grade north of 5th Street, cross 3rd Street, enter Bunker Hill, and turn northeast through a new entrance to the existing 2nd Street tunnel. The alignment would continue along 2nd Street where it would split into an at-grade couplet configuration on Main and Los Angeles Streets (one track on each roadway) to Temple Street. Then it would head east on Temple Street and realign into a dual track configuration east of Los Angeles Street and join the Metro Gold Line just north of Little Tokyo/Arts District Station on Alameda Street. Due to the high volume of trains that would traverse the Regional Connector, an automobile underpass and pedestrian overpass would be constructed at the intersection of Temple and Alameda Streets to eliminate pedestrian-train and automobile-train conflicts.

There are two options for the configuration on Flower Street. For Option A, trains would transition to underground tracks after crossing 3rd Street and continue to a new underground station just south of 5th Street, then proceed to the 7th Street/Metro Center Station and arrive at the existing Metro Blue Line platform. For Option B, trains would arrive at an at-grade station after crossing 3rd Street, then transition to underground tracks near 4th Street to reach the existing Metro Blue Line platform at 7th Street/Metro Center station. In total, the At-Grade Emphasis LRT Alternative would add 1.8 miles of new double track to the light rail system.

In addition to the Option A and Option B Station configurations, other station locations would include a station adjacent to Bunker Hill, south of 2nd Street and Hope Street, and a split station using Main and Los Angeles Streets between 1st and Temple Streets.

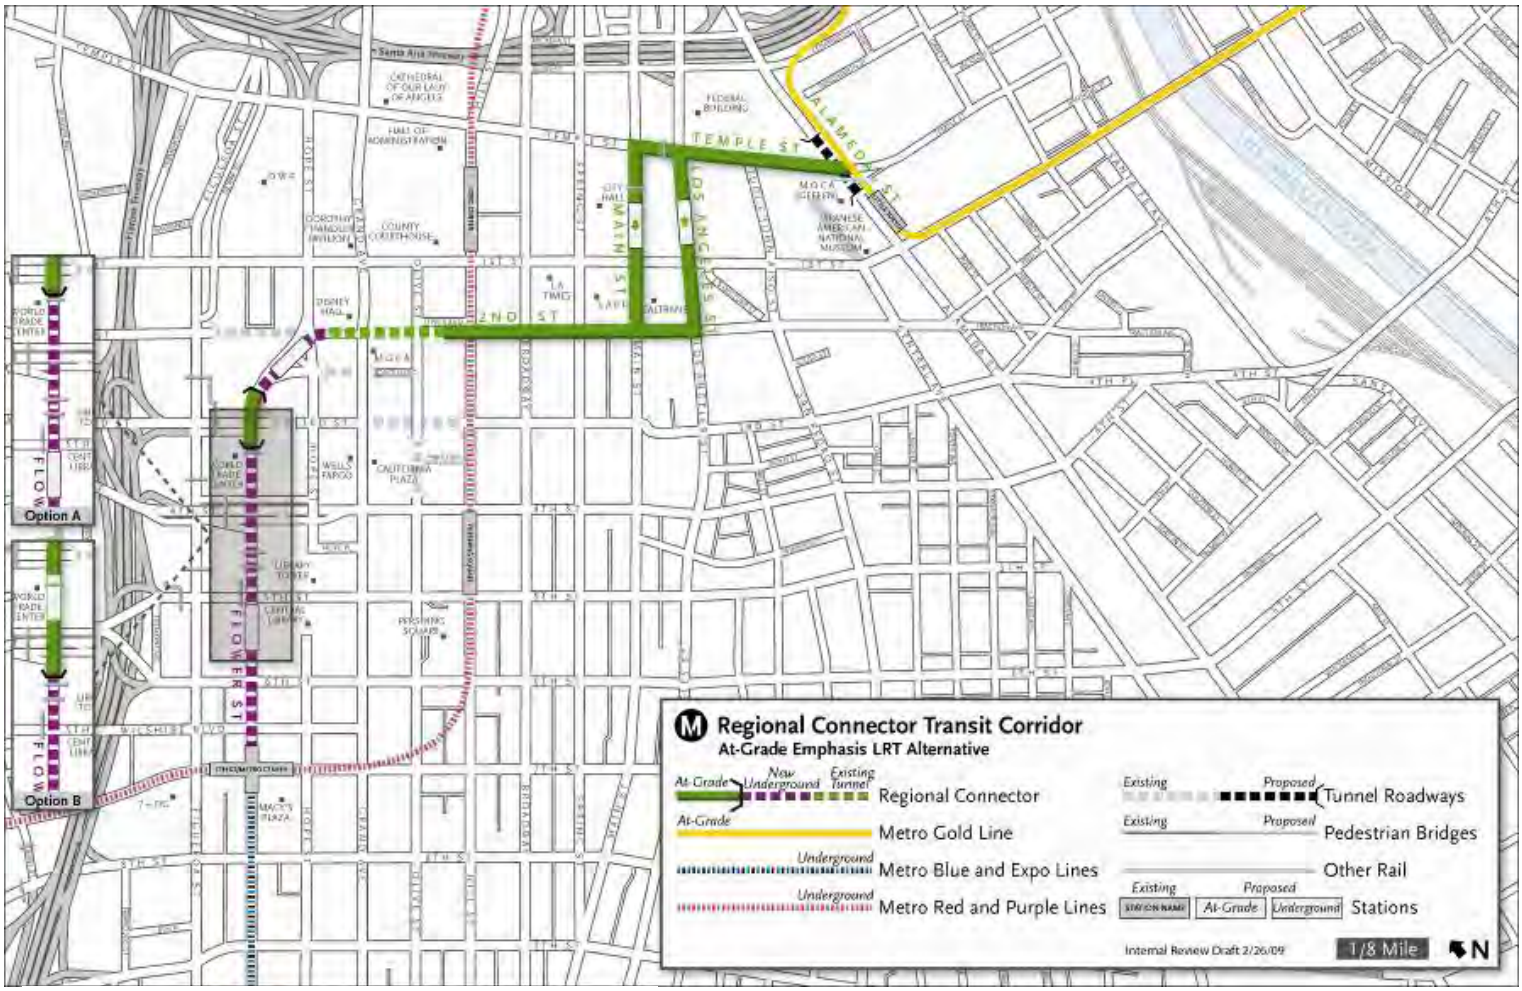

Figure 1: At-grade Emphasis LRT Alternative

Underground Emphasis LRT Alternative

From the 7th Street/Metro Center Station, this alternative (**Figure 2**) would extend north along Flower Street with a new underground station north of 5th Street. At 2nd Street, the underground tunnel would extend east with new underground stations to provide access to Bunker Hill and to the area between Los Angeles Street and Broadway. The tunnel would emerge to at-grade connections with the Metro Gold Line just southwest of the intersection of 1st and Alameda Streets. At 1st and Alameda Streets, a new underpass would carry car and truck traffic along Alameda Street below the rail junction, and a new overhead pedestrian bridge structure would eliminate most conflicts between pedestrians and trains. This

alternative would have a single at-grade crossing at the intersection of 1st and Alameda Streets. The rest of the route would be underground. The length of this proposed route would be 1.6 miles.

Station locations for this alternative would all be underground and include the area north of 5th Street on Flower Street, adjacent to Bunker Hill just south of 2nd Street and 2nd Street between Los Angeles and Main Streets.

Figure 2: Underground Emphasis LRT Alternative

Preliminary Schedule

The preliminary schedule is provided below for discussion at the agency scoping meeting.

Action	Date
Agency Scoping Meeting	March 26, 2009
Public Scoping Meetings	March 30, 2009 to April 2, 2009 (see below for specific dates)
Scoping Comment Period Ends	May 11, 2009
Development of DEIS/DEIR	Spring – Winter 2009
Public Hearings/Comment on DEIS/DEIR	Spring 2010
Adoption of Locally Preferred Alternative	Summer 2010

What is an EIS/EIR?

An Environmental Impact Statement/Environmental Impact Report (EIS/EIR) must be prepared for all major projects that may significantly affect the environment. The EIS is prepared in compliance with the National Environmental Policy Act (NEPA) and the EIR is prepared in compliance with the California Environmental Quality Act (CEQA). The purpose of the EIS/EIR is to provide full an open evaluation of environmental issues and alternatives, and to inform decision-makers and the public of reasonable alternatives that could avoid or minimize adverse impacts and enhance the quality of the environment.

Scoping Meeting Schedule

Four public scoping meetings will be conducted by FTA and Metro for the public to learn more about the project and provide comments. The scoping meetings will be held at the following locations:

- Monday, March 30, 2009 from 4:30 p.m. to 6 p.m. at the University of Southern California (USC), Alumni Room, Davidson Conference Center, 3415 S Figueroa St, Los Angeles, CA 90007.
- Tuesday, March 31, 2009 from 6:30 p.m. to 8 p.m. at the Lake Avenue Church, 393 N. Lake Ave, Pasadena, CA 91101.
- Wednesday, April 1, 2009 from 6:30 p.m. to 8 p.m. at the Japanese American National Museum (JANM), 369 E 1st St, Los Angeles, CA 90012.
- Thursday, April 2, 2009 from Noon to 1:30 p.m. at the Los Angeles Central Library, Board Room, 630 W 5th St, Los Angeles, CA 90071.

Written comments will be accepted until May 11, 2009. Comments may also be submitted at the scoping meetings, sent via email to regionalconnector@metro.net, or mailed to:

Ms. Dolores Roybal Saltarelli, AICP, Project Manager
Los Angeles County Metropolitan Transportation Authority
One Gateway Plaza, Los Angeles, CA 90012

Project Information

Additional information may be found on the project website at:
http://www.metro.net/projects_studies/connector

PAQUETE DE INFORMACIÓN SOBRE EL ALCANCE

Descripción del proyecto

El proyecto propuesto sobre el Corredor de tránsito para el conector regional brindaría una conexión directa entre diversas líneas del ferrocarril ligero que están en funcionamiento o en construcción, incluyendo la Línea Metro Gold hacia Pasadena, la Línea Metro Gold hacia el Este de Los Ángeles, la Línea Metro Blue hacia Long Beach y la Línea Metro Expo hacia Culver City. A través de Downtown Los Ángeles, el proyecto propuesto conectaría las terminales de las Líneas Metro Blue y Expo en la estación de 7th Street/Metro Center (calles 7th y Flower) con la Línea Metro Gold en la Estación Little Tokyo/Arts District de las calles 1st y Alameda. Con la implementación del proyecto, estas cuatro líneas compartirían carriles y estaciones en Downtown Los Ángeles. La longitud del corredor del proyecto varía ligeramente según la alternativa y es de aproximadamente 1.8 millas.

Propósito y necesidad del proyecto

El propósito de este proyecto consiste en mejorar el servicio de tránsito público y la movilidad de la región. El proyecto tiene como objetivo general mejorar la movilidad dentro del corredor mediante la conexión con el servicio de ferrocarril ligero de la Línea Metro Gold hacia Pasadena, la Línea Metro Gold hacia el Este de Los Ángeles, la Línea Metro Blue y la Línea Metro Expo. Esta conexión prestaría servicios a las comunidades de toda la región, ya que permitiría una mayor accesibilidad y colaboraría con la población y el crecimiento laboral en Downtown Los Ángeles.

Las consideraciones adicionales que sustentan la necesidad de un proyecto del Corredor de tránsito para el conector regional incluyen: la mayor cantidad de horarios de viaje y el hacinamiento en la estación debido a los traslados múltiples exigieron desplazar el área del proyecto; un área de proyecto que tiene muchos residentes dependientes; una mala conectividad del sistema que ocasiona una menor confiabilidad en el cronograma del sistema mientras se completan las expansiones actuales del sistema; y las inversiones dentro del área del proyecto podrían mejorar las operaciones en todo el sistema en cuanto a los horarios de viajes y las cuestiones de seguridad.

Alternativas propuestas

El Informe analítico sobre las alternativas finales para el Corredor de tránsito del conector regional (2009) preparado por la Autoridad de Transporte Metropolitano del Condado de Los Ángeles (Metro) identificó cuatro alternativas para una mayor consideración en el

DEIS/DEIR. Las cuatro alternativas incluyen: una Alternativa de no construcción, una Alternativa de Administración del sistema de transporte (TSM), una Alternativa de tránsito del ferrocarril ligero (LRT) con énfasis en el nivel de la superficie, y una alternativa de LRT con énfasis en el subterráneo.

Alternativa de no construcción

La Alternativa de no construcción mantendría el servicio existente de tránsito hasta el año 2030. No se construiría una nueva infraestructura de transporte dentro del área del proyecto aparte de los proyectos que actualmente están en construcción o que se están financiando para su construcción y funcionamiento antes de 2030 por el recientemente aprobado impuesto sobre ventas de la Medida R. El servicio de tránsito del autobús conforme a la Alternativa de no construcción se concentraría en la preservación de los servicios y proyectos existentes. Antes del año 2030 de proyección, algunos servicios de autobús habrán sido reorganizados y ampliados para prestar conexiones con las líneas nuevas de ferrocarril; sin embargo, la red de tránsito dentro del área del proyecto sería en gran medida la misma que la actual.

Alternativa de administración de sistemas de transporte (TSM)

La Alternativa de TSM incluiría las disposiciones de la Alternativa de no construcción y añadiría dos rutas de autobuses de enlace desde la estación 7th Street/Metro Center hasta la estación Union, brindando una conexión entre los servicios desconectados de la región. Una ruta iría por la avenida Grand y la calle 1st, y una iría por las calles Figueroa, Flower, 2nd y 3rd. Los autobuses de enlace usarían los carriles exclusivos para autobuses, donde estén disponibles, y se les colocarán dispositivos de señalización con prioridad de tránsito similares a los usados en Metro Rapid. Las paradas se ubicarían cada pocas cuadras, a fin de brindar una cobertura completa del área. Cada ruta del servicio de enlace tendría una longitud de una milla y media a dos millas.

Alternativa de LRT con énfasis en el nivel de la superficie

Esta alternativa (**Figura 1**) se extendería desde la estación subterránea de 7th Street/Metro Center hacia el norte por debajo de la calle Flower, saldría a la superficie en el norte de la calle 5th, cruzaría la calle 3rd, ingresaría en Bunker Hill y giraría hacia el noreste por una nueva entrada al túnel existente de la calle 2nd. La alineación continuaría por la calle 2nd, donde se dividiría en una configuración par al nivel de la superficie en las calles Main y Los Ángeles (un carril en cada calzada) hacia la calle Temple. Luego se dirigiría hacia el este en la calle Temple y se alinearía nuevamente en una configuración de calzada dual en el este de la calle Los Ángeles y se uniría a la Línea Metro Gold justo al norte de la estación Little Tokyo/Arts District en la calle Alameda. Debido al alto volumen de trenes que se

desplazarían al Conector Regional, se construirían un paso bajo nivel para automóviles y un paso sobre nivel para peatones en la intersección de las calles Temple y Alameda para eliminar conflictos entre peatones y trenes y entre automóviles y trenes.

Existen dos opciones para la configuración en la calle Flower. Para la Opción A, los trenes harían una transición a los carriles subterráneos luego de cruzar la calle 3rd y continuarían hacia una nueva estación subterránea justo al sur de la calle 5th, luego continuarían hacia la estación de 7th Street/Metro Center y llegarían a la plataforma existente de la Línea Metro Blue. Para la Opción B, los trenes llegarían a una estación al nivel de la superficie luego de cruzar la calle 3rd, después harían una transición hacia los carriles subterráneos cercanos a la calle 4th para alcanzar la plataforma existente de la línea Metro Blue en la estación 7th Street/Metro Center. En total, la alternativa de LRT con énfasis en el nivel de la superficie añadiría 1.8 millas de un nuevo carril doble al sistema de ferrocarril ligero.

Además de las configuraciones de la Opción A y la Opción B, otras estaciones incluirían una estación adyacente a Bunker Hill, al sur de las calles 2nd y Hope, y una estación divisoria usando las calles Main y Los Ángeles entre las calles 1st y Temple.

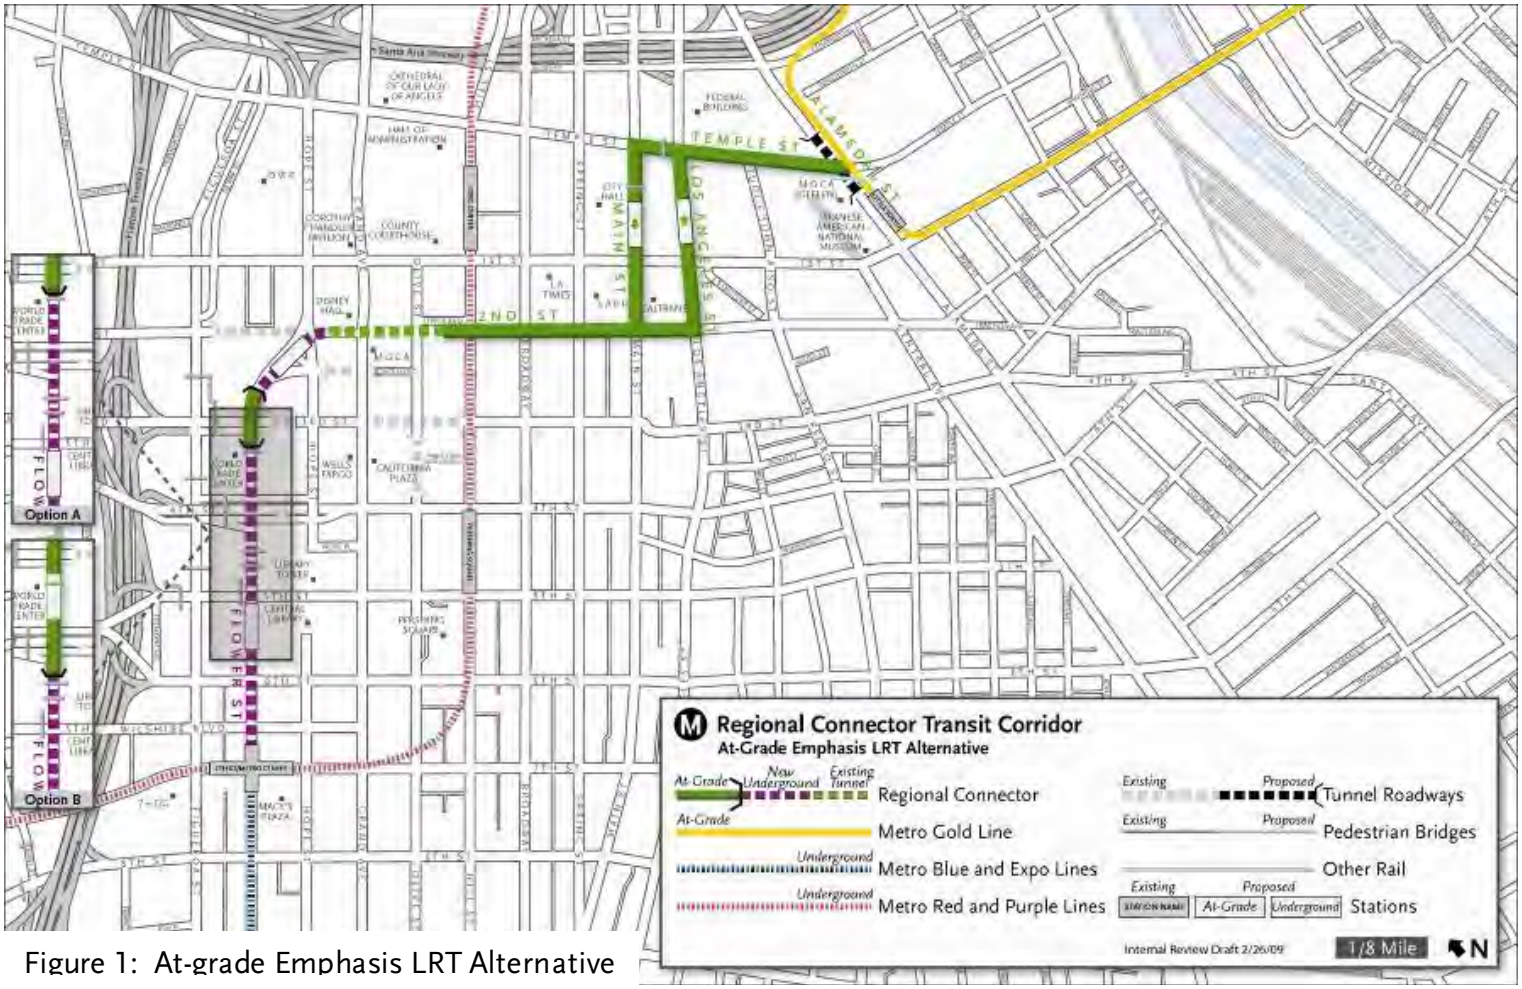

Figure 1: At-grade Emphasis LRT Alternative

Alternativa de LRT con énfasis en el subterráneo

Desde el estación de 7th Street/Metro Center, esta alternativa (**Figura 2**) se extendería al norte por la calle Flower con una nueva estación subterránea al norte de la calle 5th. En la calle 2nd, el túnel subterráneo se extendería al este con nuevas estaciones subterráneas para brindar acceso a Bunker Hill y al área entre las calles Los Ángeles y Broadway. El túnel emergería hacia conexiones al nivel de la superficie con la Línea Metro Gold justo al suroeste de la intersección de las calles 1st y Alameda. En las calles 1st y Alameda, circularía el tráfico de automóviles y camiones por un nuevo paso bajo nivel en la calle Alameda por debajo de la unión de ferrocarriles, y una nueva estructura de un puente elevado para peatones eliminaría la mayoría de los conflictos entre los peatones y los ferrocarriles. Esta alternativa tendría un cruce simple al nivel de la superficie en la intersección de las calles 1st y Alameda. El resto de la ruta sería subterránea. La longitud de esta ruta propuesta sería de 1.6 millas.

Todas las estaciones para esta alternativa serían subterráneas e incluirían el área al norte de las calles 5th y Flower, adyacentes a Bunker Hill justo al sur de las calles 2nd y 2nd entre las calles Los Ángeles y Main.

Figura 2: Alternativa de LRT con énfasis en el subterráneo

Cronograma preliminar

A continuación se presenta el cronograma preliminar para ser discutido en la reunión sobre el alcance de la agencia.

Acción	Fecha
Reunión sobre el alcance de la agencia	26 de marzo de 2009

Reuniones públicas sobre el alcance	30 de marzo a 2 de abril de 2009 (ver más abajo para conocer las fechas específicas)
Finaliza el período de comentarios sobre el alcance	11 de mayo de 2009
Desarrollo del DEIS/DEIR	Primavera – invierno de 2009
Audiencias públicas / Comentarios sobre el DEIS/DEIR	Primavera de 2010
Adopción de la alternativa preferida a nivel local	Verano de 2010

¿Qué es una EIS/EIR?

Se debe preparar una Declaración sobre el impacto ambiental / Informe sobre el impacto ambiental (EIS/EIR) para todos los proyectos importantes que podrían afectar significativamente el medio ambiente. La EIS se prepara en cumplimiento con la Ley nacional sobre la política ambiental (NEPA) y el EIR se prepara en cumplimiento con la Ley de California sobre la calidad ambiental (CEQA). El propósito de la EIS/EIR consiste en brindar una evaluación abierta y completa de los asuntos y las alternativas ambientales, y en informar a quienes toman decisiones y al público sobre las alternativas razonables que podrían evitar o minimizar los impactos perjudiciales y mejorar la calidad del medio ambiente.

Cronograma de la reunión sobre el alcance

Se llevarán a cabo cuatro reuniones públicas sobre el alcance a cargo de FTA y Metro para que el público conozca más sobre el proyecto y haga comentarios. Las reuniones sobre el alcance se celebrarán en los siguientes sitios:

- Lunes 30 de marzo de 2009 de 4:30 p.m. a 6 p.m. en: University of Southern California (USC), Alumni Room, Davidson Conference Center, 3415 S Figueroa St, Los Angeles, CA 90007.

- Martes 31 de marzo de 2009 de 6:30 p.m. a 8 p.m. en: Lake Avenue Church, 393 N. Lake Ave, Pasadena, CA 91101.

- Miércoles 1 de abril de 2009 de 6:30 p.m. a 8 p.m. en: Japanese American National Museum (JANM), 369 E 1st St, Los Angeles, CA 90012.
- Jueves 2 de abril de 2009 desde el mediodía hasta la 1:30 p.m. en: Los Angeles Central Library, Board Room, 630 W 5th St, Los Angeles, CA 90071.

Se aceptarán comentarios escritos hasta el 11 de mayo de 2009. También se podrán presentar comentarios en las reuniones sobre el alcance por correo electrónico a regionalconnector@metro.net o por correo postal a:

Ms. Dolores Roybal Saltarelli, AICP, Project Manager
Los Angeles County Metropolitan Transportation Authority
One Gateway Plaza, Los Angeles, CA 90012

Información sobre el proyecto

Se puede encontrar información adicional en el sitio de Internet del proyecto: http://www.metro.net/projects_studies/connector

審査関連情報

プロジェクト概要

今回提案される「地域接続交通路」プロジェクトでは現在稼動中もしくは建設中のライト・レール路線を直接接続することとなる。これにはパサデナ方面のメトロ・ゴールド・ライン、イースト・ロサンゼルス方面のメトロ・ゴールド・ライン、ロングビーチ方面のメトロ・ブルー・ライン、カルヴァーシティー方面のメトロ・エクスポ・ラインが含まれる。各路線はロサンゼルス・ダウンタウンで接続する。ブルー・ラインのターミナルとエクスポ・ラインのターミナルは7thストリート/メトロ・センター・ステーション（7 thストリートとフラワー・ストリート）で接続し、さらに両ラインはリトルトーキョー/アート・ディストリクト・ステーション（1stストリートとアラメダ・ストリート）でゴールド・ラインに接続する。これらの４路線はロサンゼルス・ダウンタウンで線路および駅を共有することとなる。提案される路線の距離は選択肢により多少異なるがおよそ1.8マイルとなる。

プロジェクトの目的と必要性

本プロジェクトの目的は地域の公共交通サービスと移動性の改善にある。プロジェクトの全体的な目的はパサデナとイースト・ロサンゼルス両方面のメトロ・ゴールド・ライン、メトロ・ブルー・ライン、メトロ・エクスポ・ラインを接続することにより移動性を改善することにある。この接続により地域全体がメリットを受け、より多くの人口がサービスを利用できるようになりロサンゼルス・ダウンタウンの人口増加、就業増加にのニーズにも貢献する。

これ以外にも「地域接続交通路」プロジェクトを必要とする以下の理由がある。プロジェクト対象地域においては現在複数の乗換が必要であり移動時間、また駅の混雑の増加の問題がある。プロジェクト対象地域には公共交通機関を必要とする住民が多くいる。現在の接続システムのままでは路線延長が完了する時点で路線スケジュールの信頼性が減少してしまう。プロジェクト対象地域内での投資により移動時間および安全性の面で路線全体での稼動が改善する。

選択肢

ロサンゼルス郡メトロ運輸局（Metro）が作成した「地域接続交通路最終選択肢分析報告(2009)」ではDEIS/DEIRにおけるさらなる審査のための以下の４つの選択肢が提示される。「無工事オプション」、「交通機関管理オプション（TSM）」、「路面LRTオプション」、「地下LRTオプション」

無工事オプション

「無工事オプション」では2030年まで現存の交通機関が維持される。現在工事中もしくは最近承認された対策R販売税により2030年までまかなわれる工事および稼動経費の対象プロジェクト以外、新規交通インフラはプロジェクト対象地域内では一切建設せず、現存のサービスおよびプロジェクトの維持に焦点をおく。2030予想年度までにはバス・サービスの一部を再組織、拡張し新規のレール・ラインとの接続を提供するが、プロジェクト対象地域内での交通網は大方現状維持となる。

交通機関管理（TSM）オプション

TSMオプションには「無工事オプション」の条項が含まれ、７thストリート/メトロ・センター・ステーションからユニオン・ステーションまで２つのシャトルバス路線を加えて対象地域のLRTサービスの接続を補う。ひとつの路線はグランド・アヴェニューと1stストリートを通り、もうひとつの路線はフィギュロア、フラワー、２ndストリート、３rdストリートを通る。シャトルバスは利用できるところでは現存のバス専用斜線を使い、メトロ・ラピッドで使用されているような交通優先シグナル装置を搭載する。停留所を数ブロックごとに設置し地域を満遍なくカバーする。各シャトル路線は1.5マイルから2マイルの距離となる。

路面LRTオプション

本選択肢 (図1) は地下の７thストリート/メトロ・センター・ステーションに発し、フラワー・ストリートの下を北に走り、５thストリートの北で地上に出３rdストリートと交差し、バンカー・ヒルに入り、北東に曲がり新しい入口から現存の２ndストリート・トンネルに入る。路線は２ndストリートに沿ってさらに走り、メイン・ストリートとロサンゼルス・ストリート上で路面平行線に分かれ（各線は単線）テンプル・ストリートに入る。そこからテンプル・ストリート上を東に走り、ロサンゼルス・ストリートの東で再び複線となり、リトル・トーキョー/アート・ディストリクト・ステーションの北でアラメダ・ストリート上でメトロ・ゴールド・ラインに接続する。「地域接続交通路」ではかなりの列車交通量が予想されるためテンプル・ストリートとアラメダ・ストリートの交差点に自動車専用低架線と歩行者専用高架線を設置し、歩行者対列車、自動車対列車の障害を避ける。

フラワー・ストリートの設計には２つのオプションがある。オプションAでは列車は３rdストリートを交差した後に地下に入り、５thストリートの南に新しくできる地下駅に行き、そこから７thストリート/メトロ・センター・ステーションへと進み現存のメトロ・ブルー・ラインのプラットホームに到着する。オプションBでは列車は３rdストリートを交差後平面駅に到着し、４thストリートの近くで地下線路に入り７thストリート/メトロ・センター・ステーションの現存のメトロ・ブルー・ラインのプラットホーム

に到着する。全体として平面LRTオプションではライト・レール・システムに約1.8マイルの複線が追加されることになる。

オプションA、オプションBの駅設計以外に、2nd　ストリートとホープ・ストリートの南でバンカー・ヒルに隣接した駅と、１stストリートとテンプル・ストリートの間でメイン・ストリートとロサンゼルス・ストリートを利用した分岐駅も含まれる。

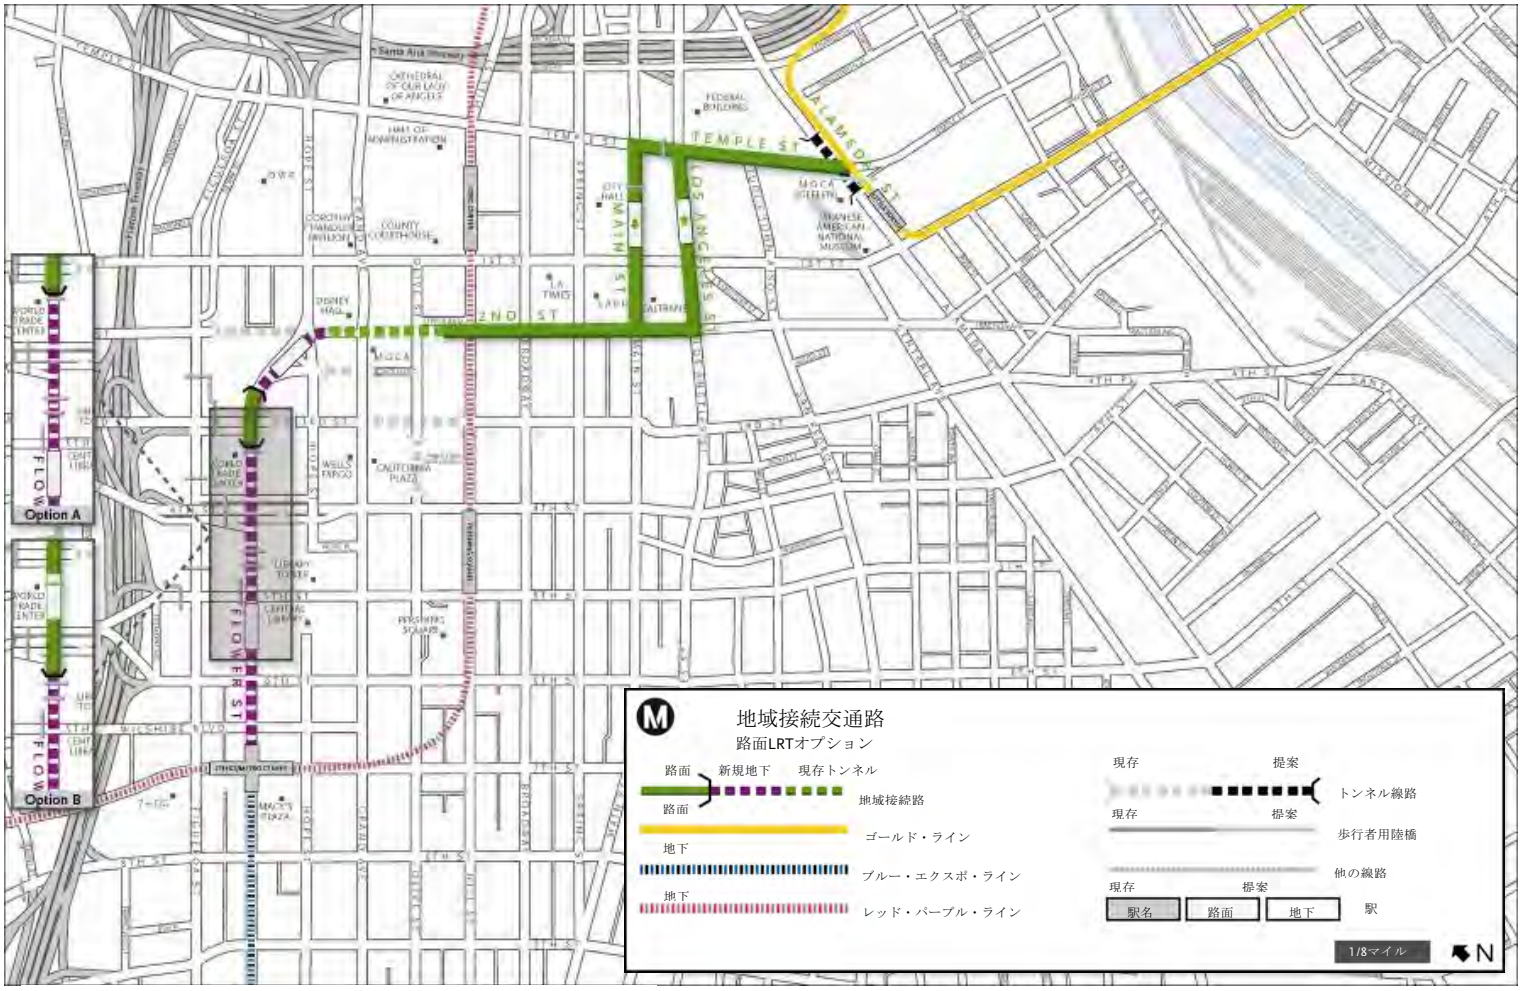

図1: 路面LRT オプション

地下URTオプション

7thストリート/メトロ・センター・ステーションから、このオプション（図２）ではフラワー・ストリートに沿って北に延長し、５thストリートの北に新しい地下駅を創設す

る。２ndストリートで地下トンネルは東に延長しバンカー・ヒルおよびロサンゼルス・ストリートとブロードウェイの間の地域にアクセスできるよう新しい地下駅がいくつか創設される。トンネルは１stストリートとアラメダ・ストリートの交差点の南西で地上に出てメトロ・ゴールド・ラインに路面接続する。1st ストリートとアラメダ・ストリートの交差点にはアラメダ・ストリートに沿って線路交差点の下に自動車・トラック専用の新しい低架線が設けられまた歩行者対列車の障害を避けるための歩行者専用高架橋も設けられる。このオプションでは１stストリートとアラメダ・ストリートの交差点のみでの路面交差となる。路線のその他の部分はすべて地下となる。この路線の距離は1.6マイルとなる。

このオプションでの駅はすべて地下となり、これにはフラワー・ストリート上の５thストリートの北、ロサンゼルス・ストリートとメイン・ストリート間の２ndストリートのすぐ南のバンカー・ヒルに隣接した地域も含まれる。

図2: 地下LRT オプション

予備スケジュール

審査会議の予備スケジュールは以下のとおりである。

内容	期日
局審議会議	2009年3月26日
公開審議会議	2009年3月30日から2009年4月2日(具体的期日は以下参照)
審議コメント期間終了	2009年5月11日

DEIS/DEIRの構築	2009年春から冬
DEIS/DEIRに関する公開聴講・コメント	2010年春
地域選択オプションの適応	2010年夏

EIS/EIRとは?

環境に大きな影響を及ぼす可能性のある主要なプロジェクトはすべて「環境に対する影響に関する説明書・環境に対する影響に関する報告書 (EIS/EIR)」の作成が義務づけられている。EISは連邦環境方針法(NEPA)に準じ、EIR はカリフォルニア州環境質法(CEQA)に準じ作成される。EIS/EIRの目的は環境にかかわる事項および選択肢の開かれた評価をし、悪影響を回避または最小限に止め、環境の質を強化できる合理的な選択肢を決定権を持つ者および一般市民に知らせることにある。

審査会議スケジュール

一般市民に対するプロジェクトの説明およびコメントの機会としてFTAおよびメトロ当局による公開審査会議が以下の4箇所で開催される。

2009年3月30日（月） 4:30 p.m. – 6 p.m.
Alumni Room, Davidson Conference Center, University of Southern California (USC)
3415 S Figueroa St, Los Angeles, CA 90007

2009年3月31日（火）6:30 p.m. – 8 p.m.
Lake Avenue Church
393 N Lake Ave, Pasadena, CA, 91101

2009年4月1日（水）6:30 p.m. – 8 p.m.
Japanese American National Museum (JANM)
369 E 1st St, Los Angeles, CA 90012

2009年4月2日（木）正午– 1:30 p.m.
Board Room, Los Angeles Central Library
630 W 5th St, Los Angeles, CA 90071

文書でのコメントは2009年5月11日まで、以下で受付。
審査会議当日
電子メール：regionalconnector@metro.net

郵送：Ms. Dolores Roybal Saltarelli, AICP, Project Manager, Los Angeles County Metropolitan Transportation Authority, One Gateway Plaza, Los Angeles, CA 90012

Powerpoint Presentation

Los Angeles County
Metropolitan Transportation Authority

Regional Connector Transit Corridor Project Draft Environmental Impact Statement/ Draft Environmental Impact Report

Public Scoping Meeting
University of Southern California
Alumni Room, Davidson Conference Center
March 30, 2009

Metro

Agenda

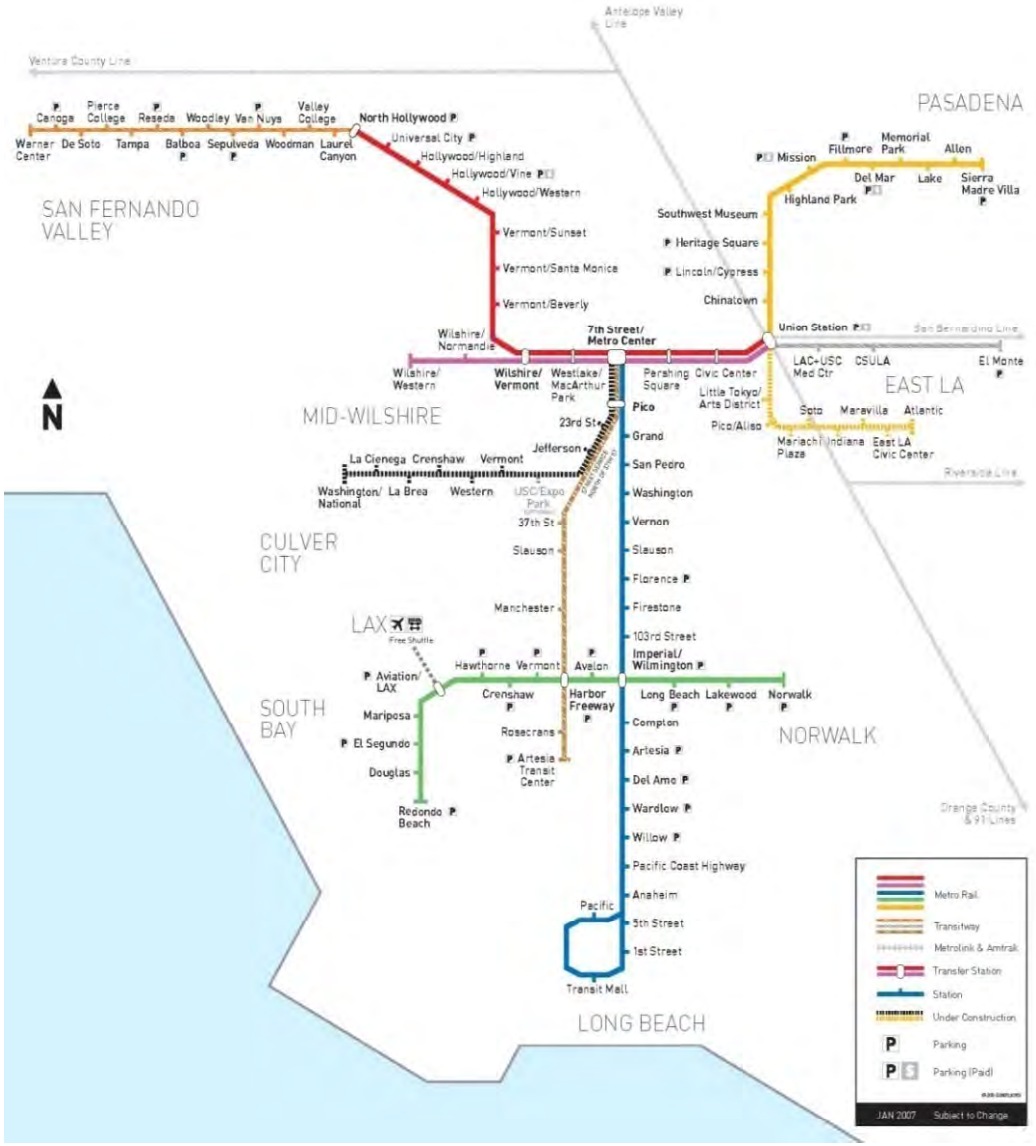
- Open House — 20 Minutes
- Presentation — 20 Minutes
- Public Comment — 50 Minutes

Metro

Metro Corridor Studies

Metro has initiated multiple corridor studies for LA County

- **Regional Connector Transit Corridor**
- **Westside Extension Transit Corridor**
- **Eastside Extension Phase 2 Transit Corridor**
- **Crenshaw-Prairie Transit Corridor**
- **Harbor Subdivision Transit Corridor**



Metro

Regional Connector Project

- The Regional Connector will directly connect:

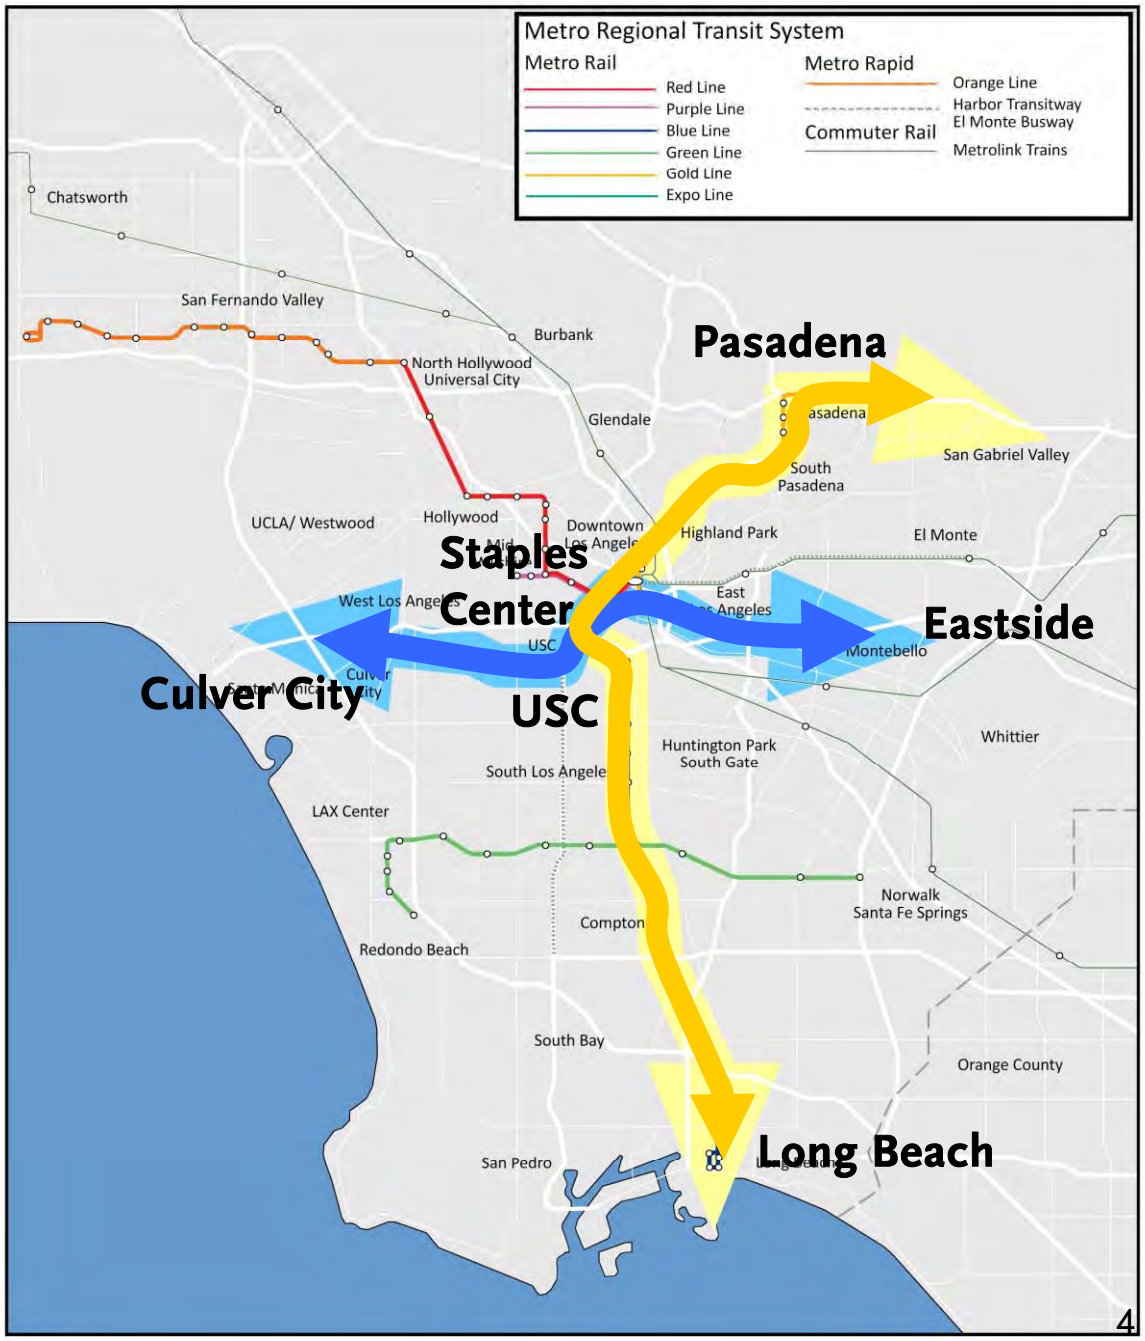
  Metro Gold Line

  Metro Expo Line

  Metro Blue Line

- This will allow a “one seat ride” for riders traveling on Light Rail Trains between Pasadena and Long Beach

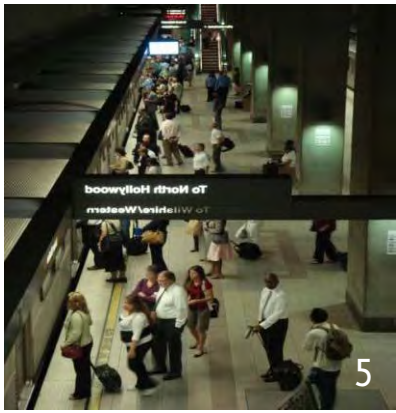
- Also provides “one seat ride” for riders traveling on Light Rail Trains between Culver City and the Eastside



Metro

Project Purpose

To improve the region's public transit service and mobility by providing a direct connection through downtown Los Angeles that links the region via the Metro Gold Line to Pasadena and East Los Angeles, Metro Blue Line to Long Beach, and Metro Expo Line to Culver City



Project Need

- Multiple transfers required to travel across downtown increasing travel time
- Station overcrowding occurs at transfer stations
- Schedule reliability reduced with system expansion
- Improved system-wide operations in regards to travel times and safety issues
- Better serve transit-dependent residents
- Expected increases in employment & residential growth and traffic congestion over the next 20 years

Metro

Study Background (1990 – 2004)

- In early 90's, this project was originally planned as an extension of the Metro Blue Line to Pasadena.
  (Pasadena to Los Angeles Light Rail Transit Project, 1993)

- Instead, Metro Gold Line to Pasadena was planned and built to Union Station with a connection to the Metro Blue Line to be pursued at a later time.
  (Pasadena to Los Angeles Light Rail Transit Project, 1993)

- Metro Gold Line Eastside Extension, approved in 2002, narrows the gap between rail lines.

- Metro performs feasibility and cost studies in 2004 on Regional Connector.
  (Regional Light Rail Connector study, 2004)

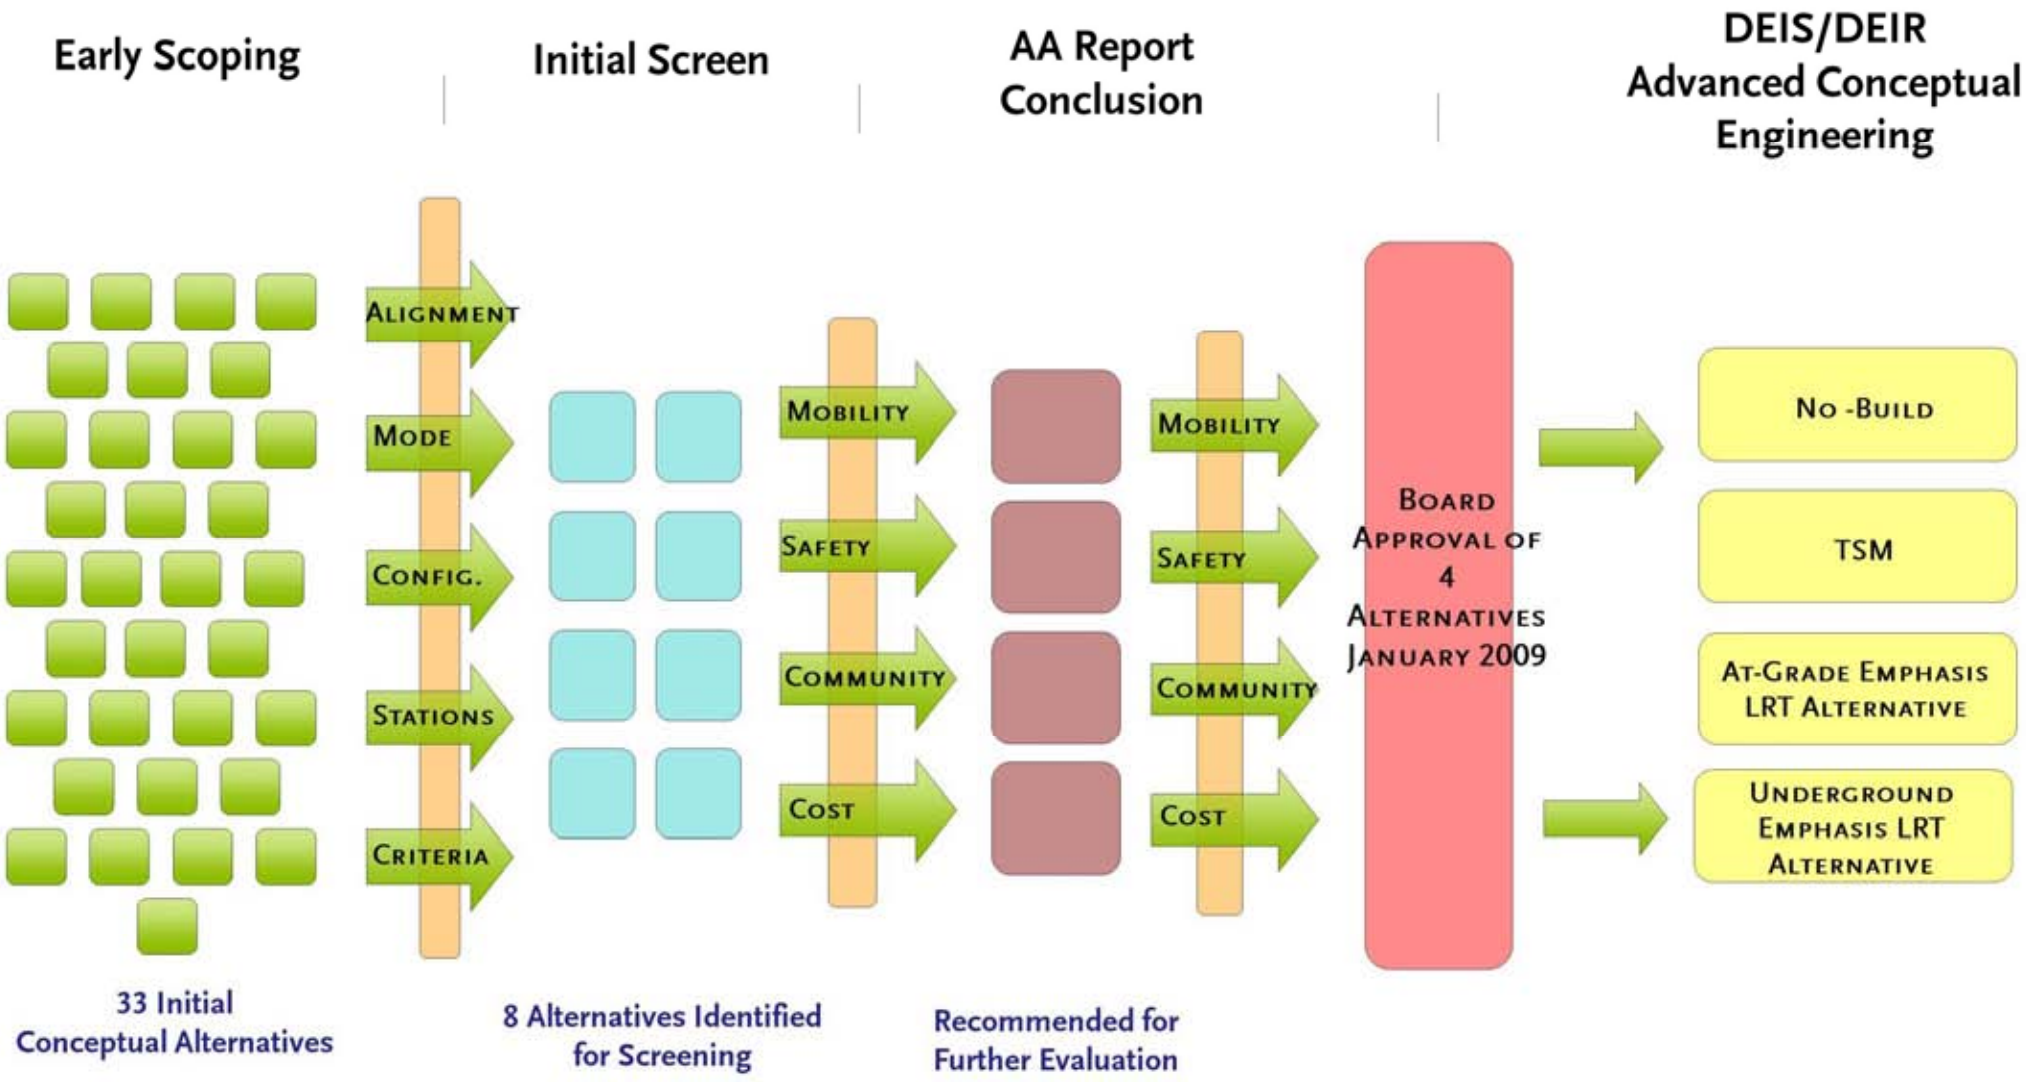
Metro

Recent Progress

- In July 2007, Metro initiated the Alternatives Analysis (AA) Study for the Regional Connector Transit Corridor.
- In November 2008, Measure R was approved and included funding for the Regional Connector Project.
- In January 2009, Metro Board of Directors approved alternatives for further study in a Draft Environmental Impact Statement/ Draft Environmental Impact Report (DEIS/DEIR)

Metro

Alternative Analysis Process



Metro

AA Community Engagement

- 3 rounds of Public Meetings
- Targeted outreach conducted with key stakeholders such as
  - Downtown Los Angeles Neighborhood Council, Little Tokyo Community Council, Bringing Back Broadway, Grand Ave., South Park Stakeholders, Central City Association, Downtown Center BID, Central City East Association, and Historic Core BID
- Community engagement will continue throughout the development of the project.

Metro

What we learned so far

The Regional Connector provides

- Travel time savings of 12-21 minutes for those currently transferring to the Metro Red Line
- Increases new transit trips by 8,000-10,000
- Cost savings to riders resulting from reduced number of transfers

Metro

Why are we here?

- The Public Scoping Period is the first step in a DEIS/DEIR process, which concludes on May 11, 2009

- Consistent with the National Environmental Protection Act and the California Environmental Quality Act (NEPA/CEQA) as well as the Federal Transit Administration's New Starts Program

- Solicit comments from the general public, agencies and organizations on the alternatives, impacts and mitigations to be studied in a DEIS/DEIR

Metro

Public Scoping Period

Notice of Intent to Prepare DEIS/DEIR published in the Federal Register

Publications:

- **LA Times, La Opinion, Rafu Shimpo, Downtown News, Daily Trojan, Garment Citizen, Pasadena Star News**

Total Mailings:

- **174 Agency Mailings**
- **1543 Postal Addresses**
- **721 Email Addresses**

Metro

Regional Connector Transit Corridor Project

PUBLIC SCOPING MEETINGS

You are invited to a Metro Public Scoping Meeting for the Regional Connector Transit Corridor Project. This project will connect the Metro Gold Line with the Blue and Expo lines through Downtown Los Angeles.

The scoping meetings start the Draft Environmental Impact Study/Environmental Impact Report process per the National Environmental Policy Act (NEPA) and the California Environmental Quality Act (CEQA) of the Regional Connector. Moving forward for further environmental review are two Build alternatives – an at-grade emphasis alternative, and an underground emphasis alternative, as well as a No-Build and a Transportation Systems Management alternative.

Content presented at the meetings will be identical, so make sure you attend at the time most convenient for you.

Please join us to provide your comments on this next phase of the project.

Monday, March 30, 2009
4:30pm – 6pm
Alumni Room, Davidson Conference Center
University of Southern California (USC)
3415 S Figueroa St, Los Angeles, CA 90007

Tuesday, March 31, 2009
6:30pm – 8pm
Lake Avenue Church
393 N Lake Av, Pasadena, CA 91101

Wednesday, April 1, 2009
6:30pm – 8pm
Japanese American National Museum (JANM)
369 E 1st St, Los Angeles, CA 90012

Thursday, April 2, 2009
Noon – 1:30pm
Board Room, Los Angeles Central Library
630 W 5th St, Los Angeles, CA 90071

Metro

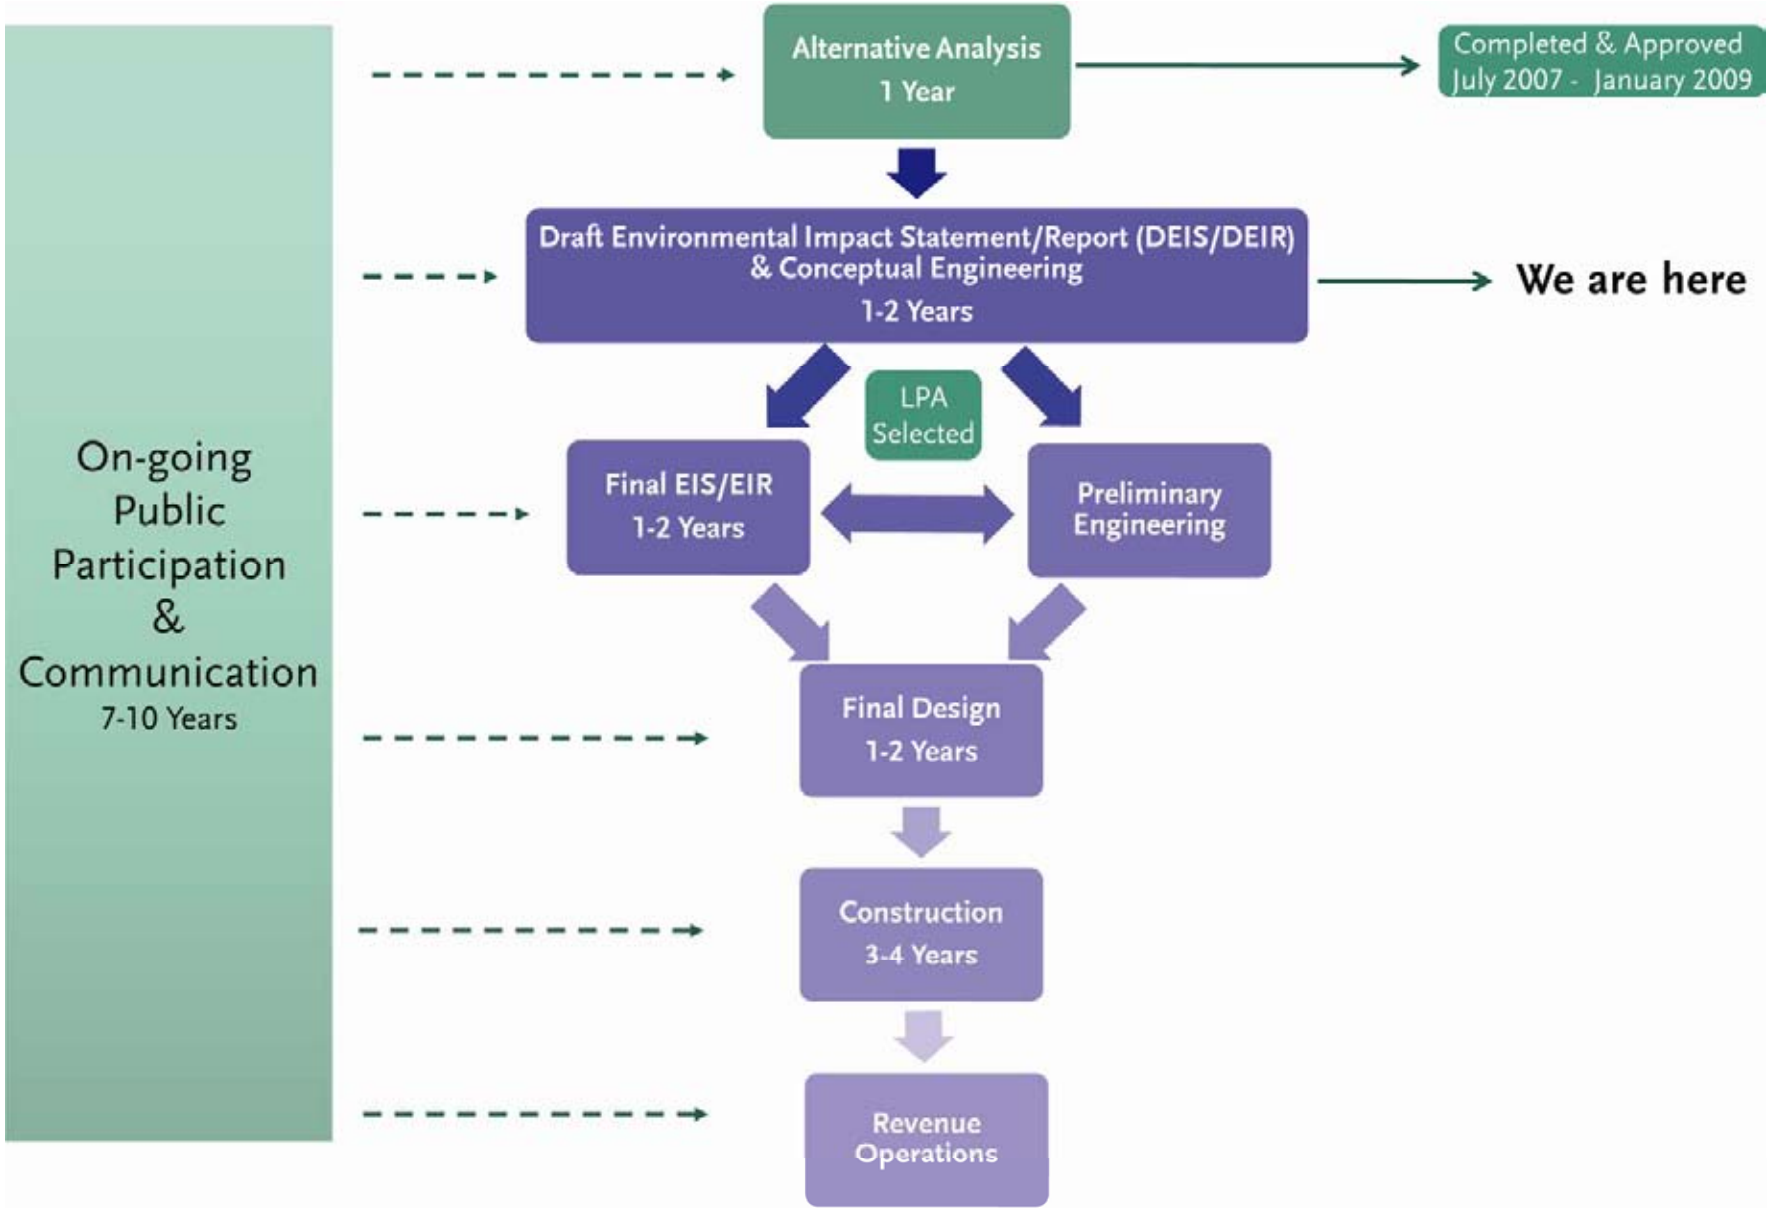
Metro

Project Development Process



Metro

Alternatives Under Evaluation

- No Build
- Transportation Systems Management (TSM)
- At-Grade Emphasis LRT Alternative
- Underground Emphasis LRT Alternative

Metro

No Build and TSM Alternatives

No Build

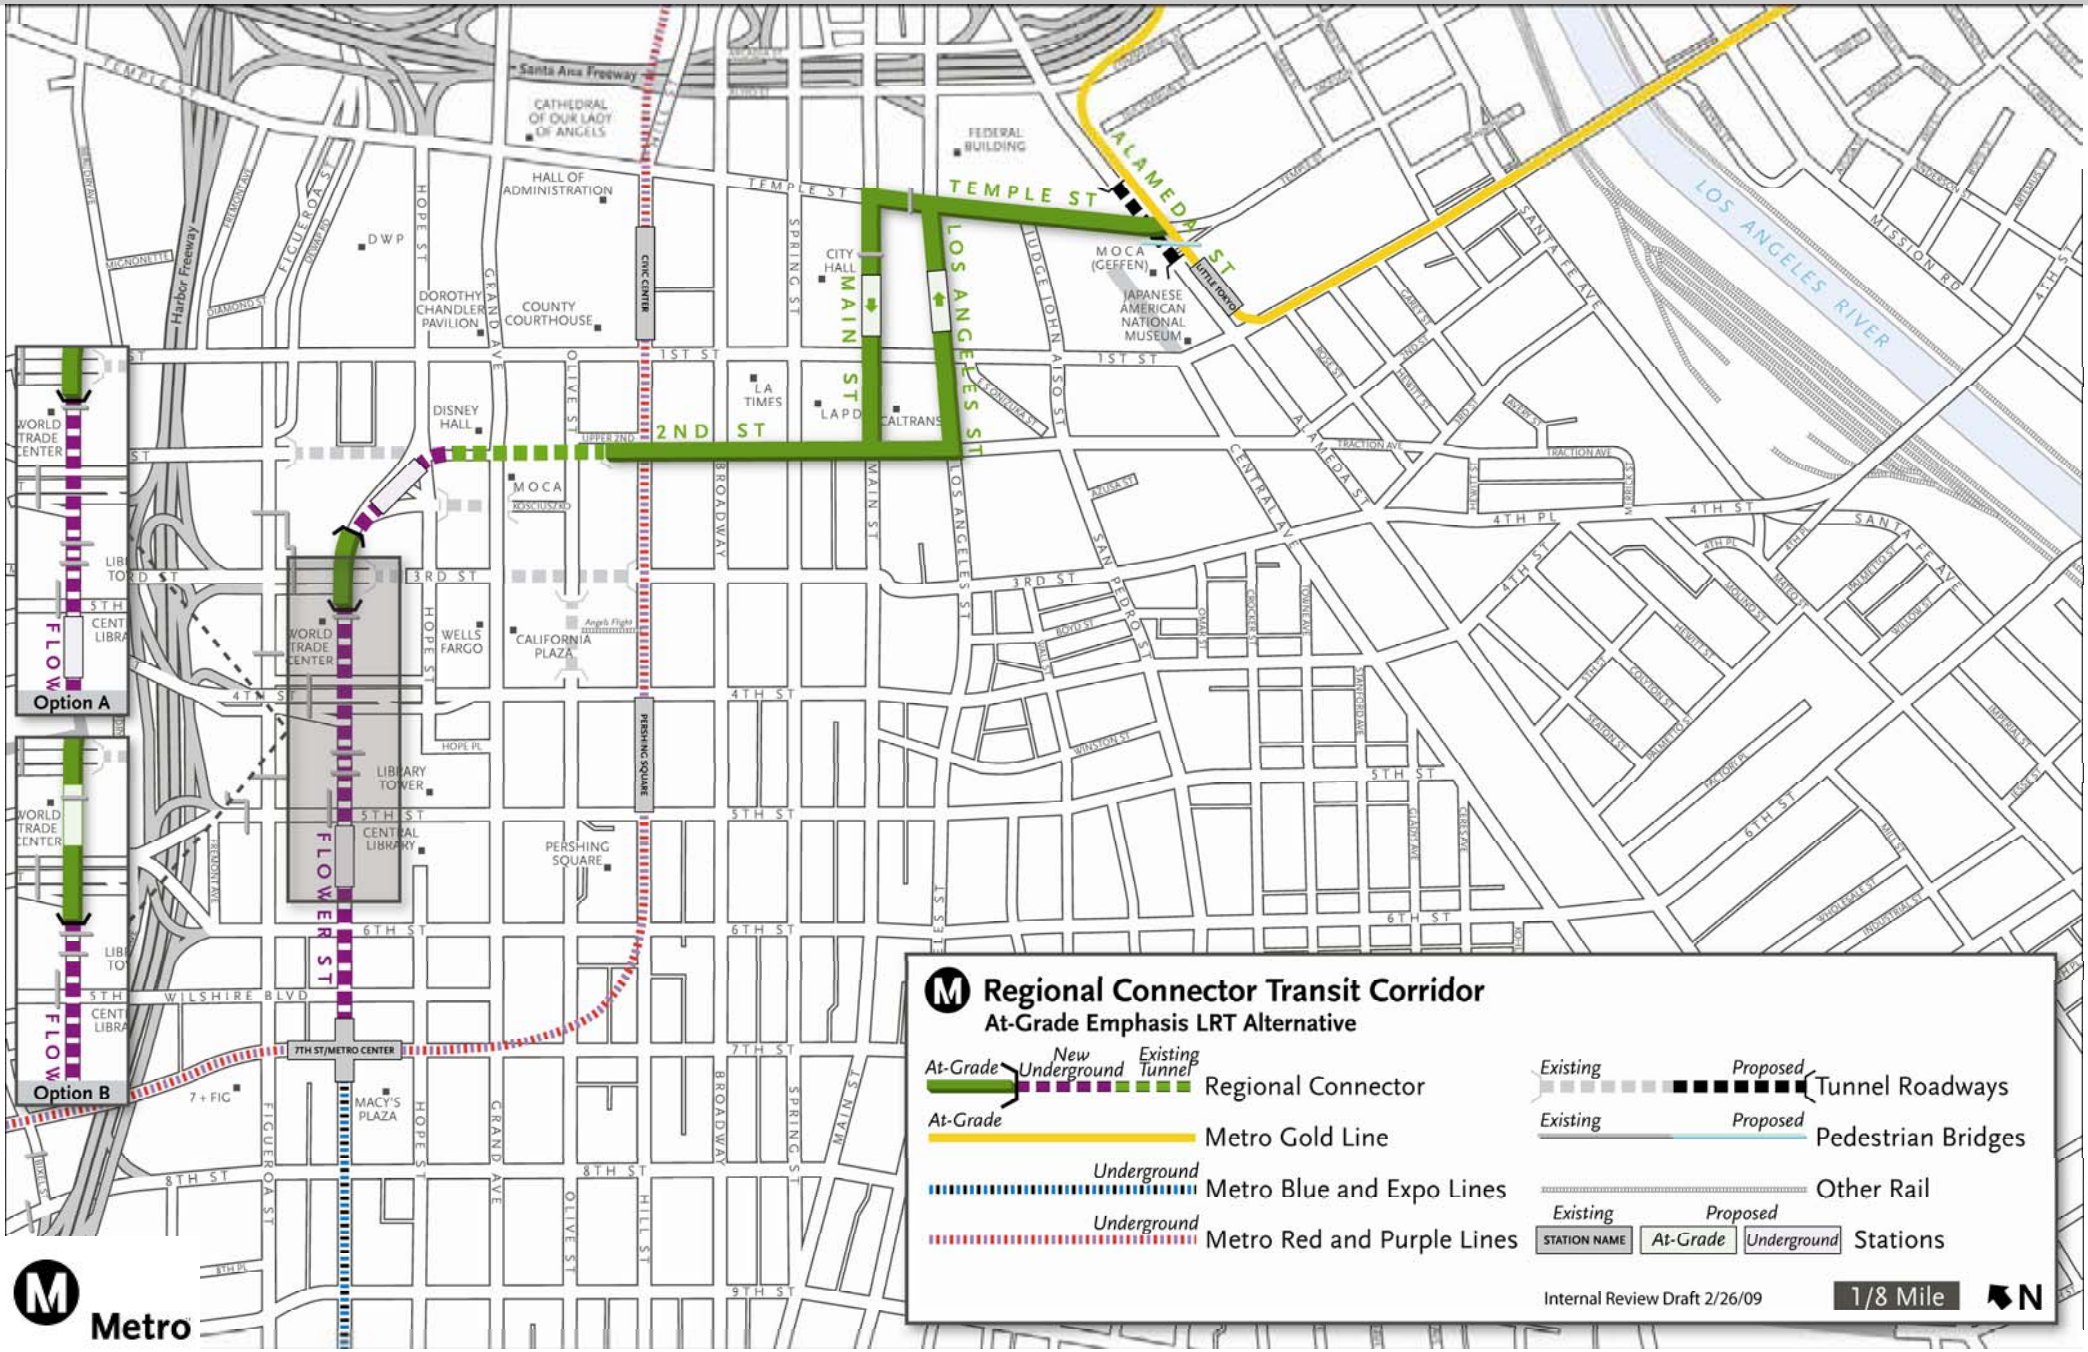
- No rail improvements other than those planned and included in Metro's 2009 Long Range Transportation Plan (Draft)
- No bus improvements other than normal bus operation growth and adjustments
- Bus operation adjustments for connections to Metro Expo Line & Metro Gold Line Eastside Extension

TSM

- Includes No Build and the addition of 2 shuttle buses linking 7th St. Metro Center Station and Union Station– operating every 2.5 min during peak hours
- Transit Priority System (TPS) could be employed to increase bus speed as well as bus-only lanes where possible

Metro

At-Grade Emphasis LRT Alternative

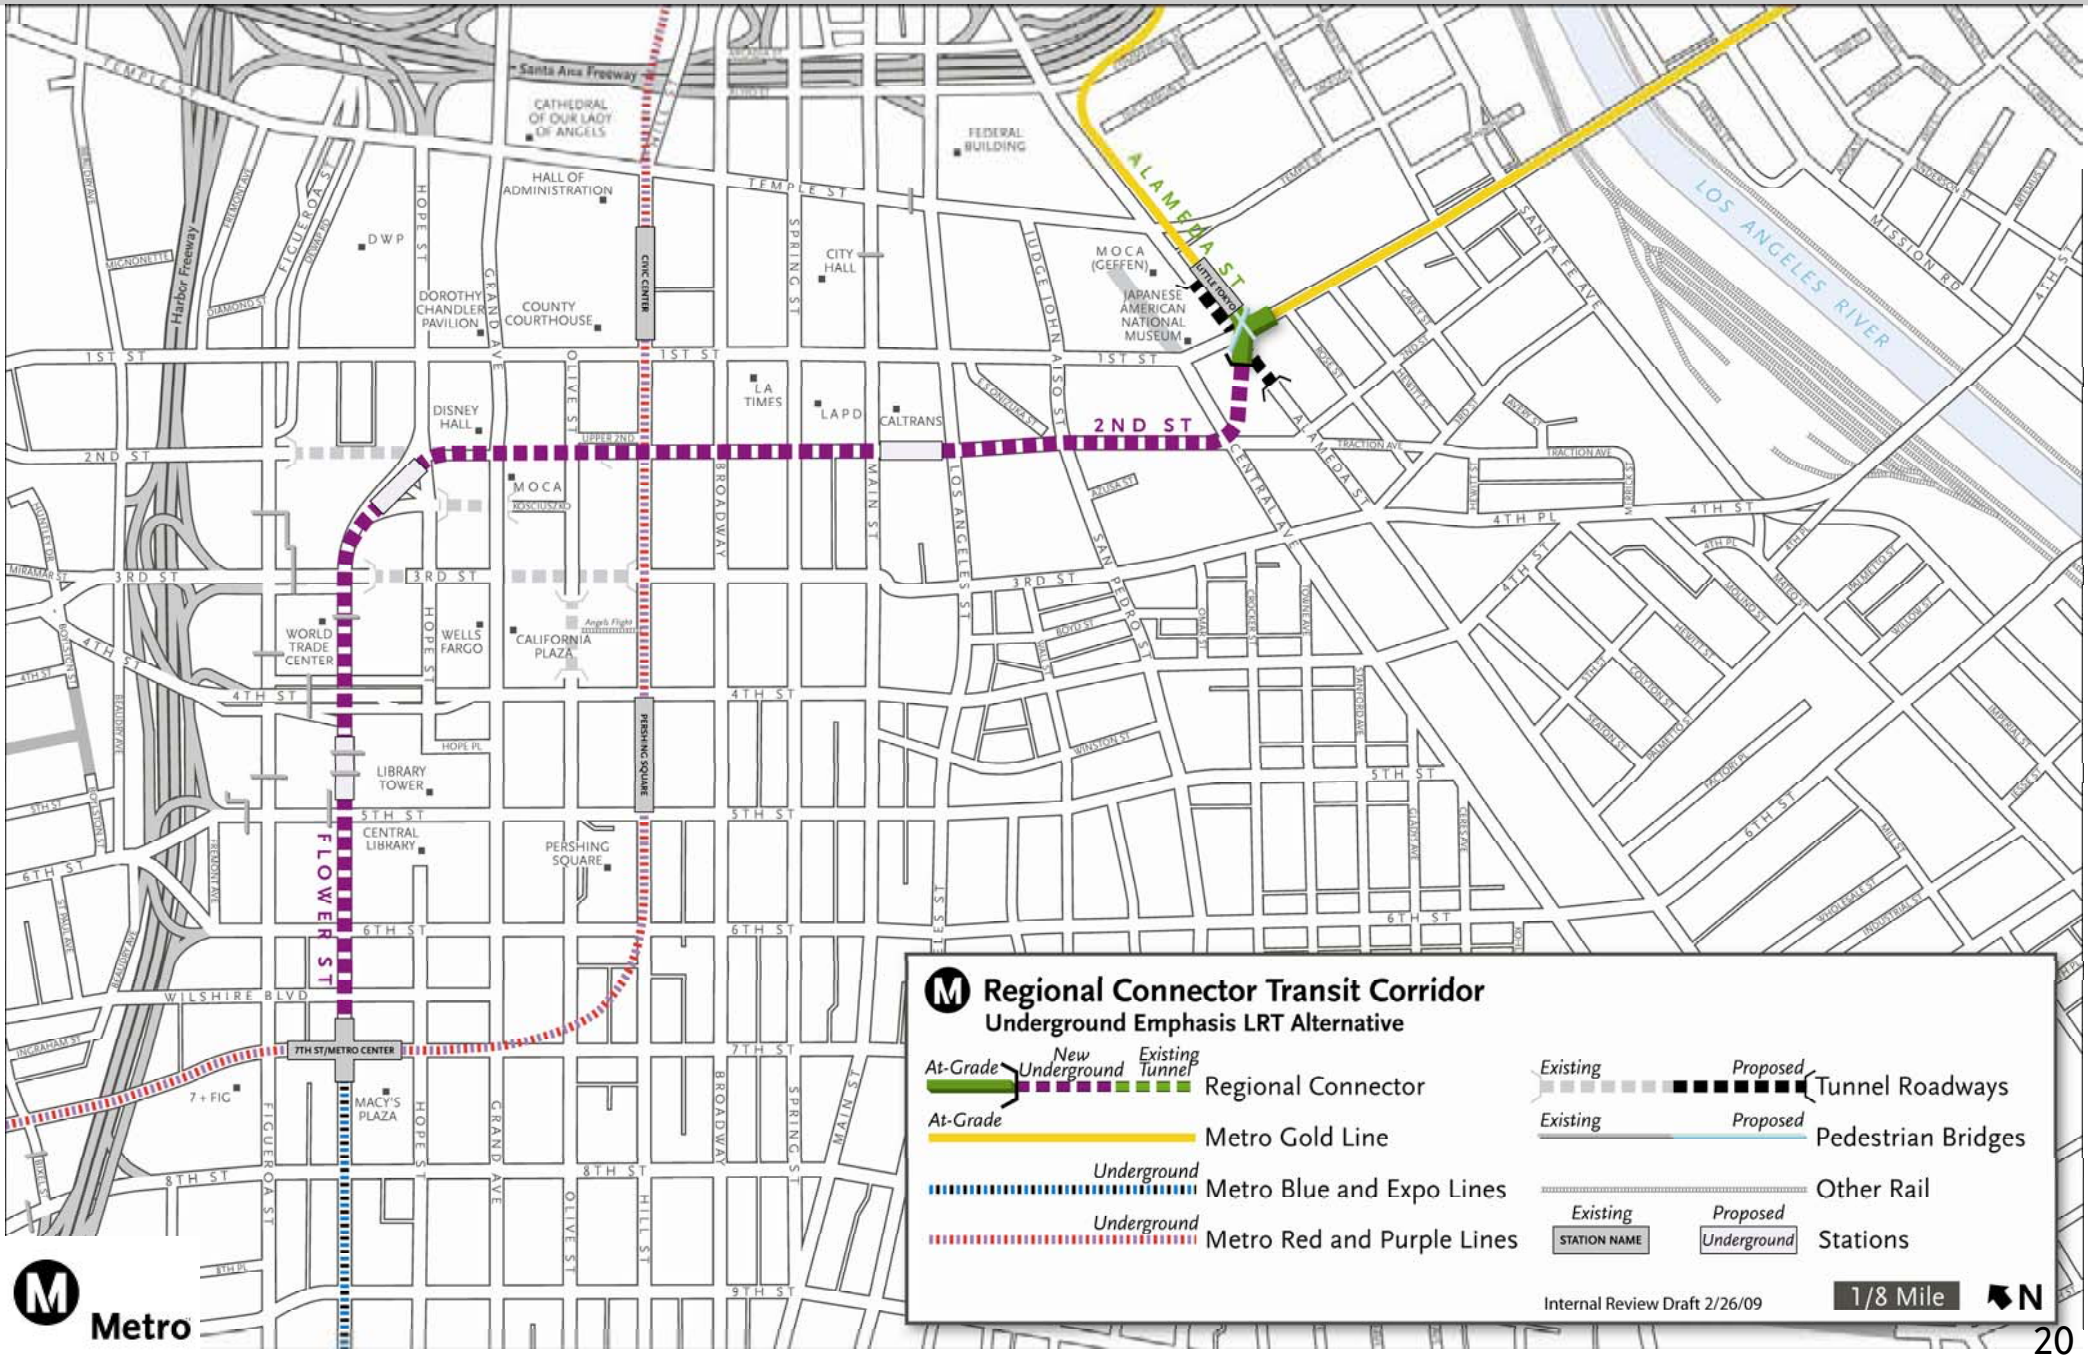


At-Grade Emphasis LRT Characteristics

- Length of new track: 1.8 miles
- Arriving 2.5 minutes during peak hours
- Operates with overhead wires
- Power substations/ancillary facilities
- Underpass at Temple and Alameda, with pedestrian bridge crossing
- Approximate station locations:
  - On Flower between 3rd & 5th Streets (underground or at grade)
  - 2nd & Hope St. (underground)
  - Split station on Los Angeles & Main Streets between 1st & Temple Streets (at grade)
- Existing Little Tokyo/Arts District Station is served by the East/West operation only

Metro

Underground Emphasis LRT Alternative



Underground Emphasis LRT Characteristics

- Length of new track: 1.6 miles
- Arriving 2.5 minutes during peak hours
- Operates with overhead wires
- Power substations/ancillary facilities
- Underpass at 1st and Alameda, with pedestrian bridge crossing
- Approximate station locations:
  - On Flower between 4th & 5th Streets (underground)
  - 2nd & Hope Street (underground)
  - On 2nd Street between Main & Los Angeles Streets (underground)
- Existing Little Tokyo/Arts District Station will be served by the north/south operation only

Metro

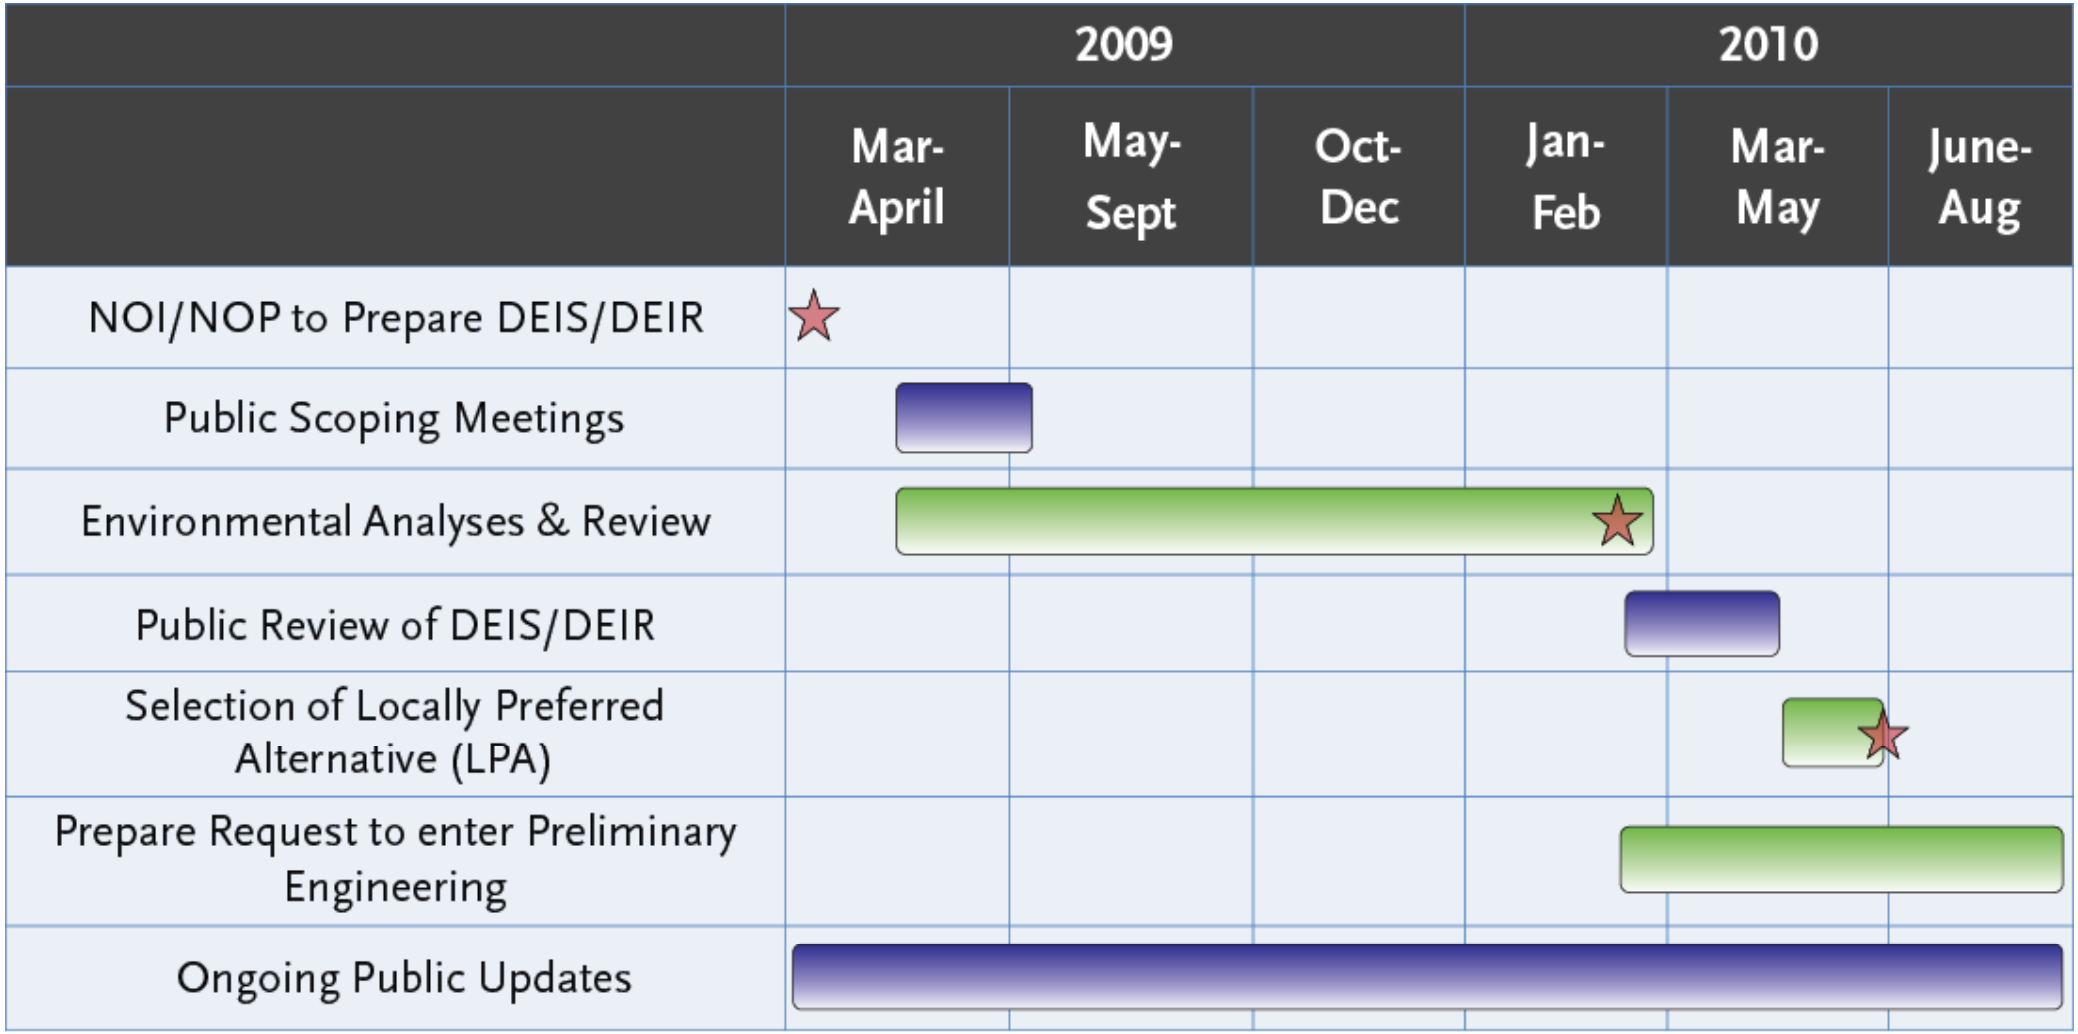
Environmental Issues to be Analyzed

The purpose of the DEIS/DEIR is to further refine the project alternatives and demonstrate project benefits while identifying the potential effects of construction and operation. Measures to enhance project alternatives and to avoid, minimize, and mitigate adverse impacts will be identified and evaluated so that the best project alternative is selected.

- Traffic, Transit & Parking
- Visual & Aesthetics
- Air Quality
- Cultural/Historic Resources
- Safety & Security
- Geology & Soils (Subsurface & Seismic)
- Water Resources
- Biological Resources
- Noise & Vibration
- Energy Use
- Hazardous Materials
- Parks & Other Community Facilities
- Land Use
- Displacement/ Relocation of Uses
- Community Impacts
- Economic Development
- Fiscal Impacts
- Environmental Justice
- Growth Inducing Impacts

Metro

DEIS/DEIR Schedule



Metro

Public Participation Opportunities

Project Tasks

Milestone: Circulate DEIS/DEIR

Results of Scoping and DEIS/DEIR

- Comments will be collected for the record until May 11, 2009
- Comments will be addressed in the DEIS/DEIR
- Continued public updates and participation
- Selection of a Locally Preferred Alternative (LPA) by Metro Board at conclusion of public review process

Metro

Public Comments

- Scoping comment period through May 11, 2009
- Complete comment form
  - At a scoping meeting
  - By Mail: Dolores Roybal Saltarelli, Project Manager

    One Gateway Plaza – MS 99-22-2,

    Los Angeles, CA 90012
  - Via web: www.metro.net/regionalconnector
  - Email: regionalconnector@metro.net

Ken Alpern	20

Los Angeles, California, Monday, March 30, 2009

4:50 p.m.

MS. KERMAN: I see I have a card back there, and the Councilman wanted to make --

COUNCILMAN LA BONGE: Can I borrow your red pen? Can you get a map up there, where the map is, you know, where it shows --

MS. ROYBAL SALTARELLI: Which map?

COUNCILMAN LA BONGE: Any one of them. They're all the same.

Anybody ever go to the San Diego Stadium to see the Chargers play? They run trains there, sometimes up to 25,000 people. So I think our argument here is the Expo Line is going to allow people to park in Downtown and take the Expo Line to the stadiums, whether it's an SC game or a soccer game or an event.

And the other thing I do want to say loud and clear, can we -- how can we get Dodger Stadium into this discussion, truthfully? Do I got to talk to Roger Stoble? He's got six more days, I think. I'll talk real fast. I think it's real important we get Dodgers in there.

The other point I want to make here is the

concept -- it's a very good presentation that you made, Dolores, and I want to say most people give a PowerPoint presentation and they read everything. You actually highlighted the important things and we all read it by there. That was a very good presentation.

Give her a hand.

Now, our concept is to go from Pasadena and Long Beach as fast as possible. If I live in Pasadena and work in Long Beach, I don't need to go through Downtown L.A. What if there was some thinking here that got you down Alameda to Hooper and into the regular line or over to Central, because I think the transformation of Alameda and Central will take place in the next few years as it is.

So I just wanted to make those two points and thank everybody for being a part of the public process. It's amazing when few people speak, they have a louder voice. So it's important that you're all here.

I thank you, Ann. Very good presentation.

MS. KERMAN: Thank you, Tom.

As we said before, there's going to be three ways -- three or many ways for you to participate in this public process, but the first way we're going to actually

do right now is hear your public comments.

What I'm going to do is call up three people,

just to be ready on deck, and then you'll be able to come up to this mike. We'll be setting the timer for two minutes and then hear you, and we have our court reporter. So the first thing I'm going to ask is for you to state your name clearly and then we'll hear from you.

So first up will be Craig Thompson. Second, Professor Najm Meshkati, and then Justin Walker.

So Craig?

MR. THOMPSON: Well, Mr. LaBonge, you stole the words right out of my mouth here with that Downtown connector proposal to run it down Alameda to Washington, west on Washington, hook in with the Y connection to the Blue Line.

It will be very cheap. The taxpayers would swallow this up like it was an M&M in it without a burp,

because it looks like the cost of such a connector would only be about maybe 500 million or less, rather than the 2 to 3 billion that this would cost.

Plus, if you wanted to save the Seventh and Metro tunnel for any other purpose, that could be used for going up to Dodger Stadium and beyond, all the way into Glendale and Burbank.

The thing here is to get the connector built as quickly as possible and as cheaply as possible, and those two alternatives are not the way.

Going down Alameda to Washington with a Y connector at Long Beach Boulevard, another Y connector at Flower and Washington, would fit the bill perfectly.

Thank you very much.

MS. KERMAN: Thank you, Mr. Thompson.

Next up, Professor Meshkati.

PROFESSOR MESHKATI: Thank you, ma'am. Thank you very much for coming here. I would like to welcome you to our beautiful campus.

I'm a professor of engineering here and I know a little bit about light rail and light-rail safety. I have been having two grants on grade crossing and then I've been appointed to review and develop the new update Manuel 57 by TCRB on light-rails design.

I would like to really ask MTA this time, with all due respect, to do it right. I've been involved in the case of Exposition light rail as a pro bono expert witness. We fought the Exposition line construction alternative and we won, and I don't want to work another 3-, 4-, or 500 hours pro bono to fight MTA to teach them what to do.

This report that MTA did on the hazard analysis for the Exposition light rail, my student is here and knows that it wouldn't get more than a C minus in my class, and that's only if I'm in a good mood.

Please make sure that your consultants do a great job on hazard and risk analysis. We know how to do it, and don't let us and some other attorneys go and fight MTA again during the evidentiary hearing of the CPUC to convince them that what's the right way to design a light rail.

As I said, I speak from experience. I'm a professor of engineering here. I've been recently appointed to the Transportation Research Board, TCRB, panel to do that.

By the way, I'm not beating my own drums. I'm not going to be here. I'm not looking for consulting for myself. I have greater students. Next year at this time, I will be at the State Department as a Jefferson science fellow for a year or two years. I'm not doing that for myself. I just want to make sure that MTA does it right, this time at least.

Thank you.

MS. KERMAN: Thank you, Professor.

Next up is Justin Walker, followed by Spencer Kassimir, followed by Roasina Suvaroporn.

MR. WALKER: Hello. My name is Justin Walker. I'm a student volunteer with the USC Chapter of CALPIRG, on the Public Transit Campaign.

L.A. County, over the last 19 years, we've

developed a substantial light-rail system, branching throughout most parts of the County; but as we all know, there's a big gap in the middle, and this is a great way to link the gap in the middle of the system. But it's important to recognize that this regional connector will be a core to a system and it must be the most robust part of the system and, therefore, we have to do it right the first time.

Digging Downtown is expensive. Disrupting traffic and putting in stations is expensive. So we have to make sure we do it correct with the underground alternative of some sort, and when I say "underground

alternative," I'm not referring to the Underground Emphasis Alternative that we see here, but rather a complete underground alternative that involves a grade separation, a complete grade separation, at First and Alameda, 'cause presently there could potentially be trains running from Long Beach to Pasadena, from East L.A. to Culver City, and there's even some interest for trains running directly from East Los Angeles to Pasadena.

So that would involve six different train movements moving through the intersection at First and Alameda and, therefore, that would clog up First Street. The current underground alternative involves an at-grade

crossing with all six movements at First and Alameda going into the transition to the subway section. So, therefore, we have to make sure we do an underground alternative that is strong enough to support

two-and-a-half-minute headways. When you have six different directions, you have headways equaling about a minute.

So please go with the underground alternative and make sure this is a strong core of the system, with complete grade separation. We can't afford to do it again if we mess up (indicating).

MS. KERMAN: Thank you, Mr. Walker.

Next up, Spencer Kassimir.

MR. KASSIMIR: I also want to voice my support of a fully underground route. This is a major metropolitan area. Coming from New York, I'm surprised that anything is done at grade. With the capacities we have in Tokyo, everything is underground.

I just don't see any success in doing it at grade at all, if it's going to increase traffic, not just for cars but buses, at all. I think part of a mass-transit project is not to exacerbate a preexisting problem, but to help assuage it. I mean, definitely it won't cause or encourage more people to ride, but the people who won't ride still won't and then there will be

more traffic and more pollution.

I think, also, I agree it should be fully underground, mainly for the reason that if you are going to have all these routes coming through, yes, it's going to increase train congestion; but in addition to that, there have been problems with safety in the past at grade, with cars hitting Gold Line trains and Blue Line trains.

In addition, those areas do not have safety arms, and still continue not to, in Highland Park and areas of Washington Boulevard.

So my confusion again with this is why would we need to choose if we just want a north-south station for Little Tokyo or an east-west? I think we should even maybe wait a little until we have the funds to do it completely and do it right.

Thank you.

MS. KERMAN: Thank you very much. Next up -- go

ahead.

MS. SUVAROPORN: I'm Roasina Suvaroporn. I'm a student here at the Engineering Department. I'm also in Dr. Meshkati's class.

We're considering human factors in engineering. I also support the underground system, 'cause we've been analyzing the at-grade causing accident for a bit, for a

semester, last semester, and we've seen at least three accidents that shouldn't have been happened if Metro was really considering safety of our community better than they have been. So, yes, I support the underground system. And correct me if I'm wrong, but isn't the day pass for the Metro $3 to get --

MS. KERMAN: $5.

MS. SUVAROPORN: It went up now? So I think connecting it --

MS. KERMAN: It may be for students. It may be less

for students.

MS. SUVAROPORN: Okay. So I think you're thinking right in connecting all the connections together in one point. That's a way to save money, but my question is how are you guys going to raise money for this project? Like, who's the sponsor and who's going to take charge of this? Thank you.

MS. KERMAN: Okay. Thank you very much.

Next up is Steve Bagby, Sr., followed by Pat Jones.

And I'd like to also invite anyone else that would like to speak tonight to fill out a speaker card. They're available at the back desk. Raise your hand and we'll get you one. And, again, we're very interested in hearing from you on the project purpose, the need, the

project alternatives, the potential impacts, and

mitigations that you think we need to be looking at in this project.

So with that, Mr. Bagby.

MR. BAGBY: Thank you so much.

My name is Steve Bagby, Sr. I'm a member of the Dorsey High Alumni Association and the Fixed Expo Coalition. I'm also the former director of Transportation of Housing for the late Congresswoman Juanita Millender McDonald.

I oversaw the Alameda Corridor, so I know a little bit about below grade.

I want to commend USC -- first of all, I want to express my regrets for the two students that were injured by a car accident on Hoover and Jefferson yesterday. Any life is too much to lose.

We are concerned about -- well, first of all, let me say on a positive note, for the inner-city Los Angeles community, we are very much for the Expo Line. We see its value. We just think it needs to be built safe. I did live in New York for ten years. I don't know why Los Angeles cannot do something that's user-friendly and safe. Your wonderful professor has done a magnificent job going to Dorsey High and Foshay at

public meetings, explaining some of the problems, some of

the faults with the EIR that's been done, and he's to be commended, 'cause he's been doing it pro bono.

Let me say that we have a letter that we are soliciting signatures for that is asking the Mayor and the Governor to use Proposition R money to be used for the Expo rail and the H.R. money, the Reinvestment Reconstruction, the Stimulus Package, because technically the Expo Line is shovel ready. It will provide jobs. It will do it safely. Right now, only -- Farmdale at Dorsey is the only location that's left in play that it might remediate students getting injured. Okay?

This coming Saturday, from Foshay Middle School, where the California Public Utilities Commission voted not to extend a bridge, we are going to be marching from Foshay to Dorsey from 9:00 to 12:00.

MS. KERMAN: Thank you, Mr. Bagby.

Next up, Pat Jones, followed by Mike Metcalfe.

MS. JONES: Hi. My name is Pat Jones, and the reason why I came today is because this is so vitally important for our seniors. Our seniors and our disabled can't do a lot of walking. So wherever you have this Metro rail, it has to be ADA accessible because, you see, now, more than often, you have seniors coming out and you have seniors doing their laundry, doing their shopping, and they are taking these buses. They are taking these Metro rails.

It has to be safe for these individuals, the senior and disabled. You have blind taking these buses and these Metro rails and the concern that I have is that they're not connecting these buses, number 1. So if they're not connecting the buses right now, what do you think is going to happen when the Metro rail comes into light? Are they going to be connected, where these people don't

have to stand and wait?

There is a lot of gang retaliation, a lot of gang members going out there shooting and carrying on. These seniors and these disabled individuals, they can't run, so they're in harm's way of whatever is out there on the streets. So we have to take that into consideration.

Another thing we're looking at is that we're dealing with -- I live in South Central L.A., so we're dealing with the south, we're dealing with the west, we're dealing with the east, we're dealing with Central, we're dealing with Harbor Gateway, and we're dealing with Wilmington; and if these buses and these connectors are not connecting to fit our needs, it's like this is useless for us in South L.A. because we need to make sure we're connected from point A to point B, because a lot of individuals -- I have a car, but a lot of individuals don't.

I'm looking at -- I'm an advocate for these

individuals and they can't speak up for themselves because they don't know what they need, but I know basically what they need. They need to get from point A to point B, and if those allegations (sic) are not affordable for them, then what do they do? They're like left out of the mix.

So I just hope you consider the seniors and disabled. Thank you so much.

MS. KERMAN: Thank you very much, Ms. Jones.

Next we have Mike Metcalfe, followed by Damien Newton.

MR. METCALFE: Thank you very much.

I was able to work on it a bit during the Alternatives Analysis and participated in drafting the Urban Design and Planning Report, and I would like to put in a personal plug for the underground system as well and ask everyone to remember that the underground alternative does have the potential to generate terrific revenue-generating public/private/joint development projects, where the at-grade system is very limited, perhaps Bunker Hill near the Grand Avenue Disney Hall site.

But the underground system has that plus two to three other major sites for major public/private real estate transactions with Metro that would ultimately

generate fiscal revenues and revenues that would go to help pay debt service for the construction costs of the system, and that's an extremely important economic advantage, the idea of leveraging our public taxpayer investment and making it generate additional funds.

Thank you.

MS. KERMAN: Thank you, Mr. Metcalfe.

Next, Damien Newton.

MR. NEWTON: Hi. I'm Damien Newton.

Three points, real quick. One, support underground rail. As someone that lived and worked in New York City, it's better, easier, faster. It's simple.

Second, I know the Alternatives Analysis is over

so you're unlikely to start studying new routing to Dodger Stadium, but just in case, to heck with the Dodgers. They were unwilling to raise parking by four cents a customer, which would have funded the trolley bus shuttle. So if they're not willing to pay up four cents or work with their contractors, they don't deserve transit anyway. And if you're a baseball fan and you're saying, "That's not fair to me," well, you can take Metrolink straight to Anaheim.

The last thing, you've heard a little bit about multi-modalism tonight with buses. I want to throw in a quick pitch for multi-modalism for bikes. Metro Board

just passed a resolution last week that's going to add almost 400 racks and lockers to Metro stations, but you know what? It would be easier just to put them right in as you're building the stations. So let's put those in on the plans. That would be great.

MS. KERMAN: Thank you very much. Do I have any other public comments?

Well, with that, on behalf of Metro, I would like to thank you for joining us this evening -- no, it's still this afternoon. I would like to thank you for joining us this afternoon and providing your continued input.

If you would like to provide further input, there are a number of ways to do so. You may complete a comment form that we have available on the back table. You may also e-mail us at regionalconnector@metro.net. You may write us a letter and the information, I believe, is on the comment form in the back. Make sure that you get us your comments before May 11th and continue to stay in touch with us, because we are going to continue to inform you as we progress on this portion of the study.

You may log on to the website, metro.net/regionalconnector and follow the study progress. We will be continuing to engage the community throughout this process. Stay tuned for future meetings,

and we encourage you to visit the website. We encourage you to visit the registration table to make sure that we have your most current information so that we may keep you informed.

And, again, I thank USC for their hospitality and I thank all of you for coming this afternoon.

Thank you.

(Pause in the proceedings)

MS. KERMAN: Ken, you can state your name.

We have another speaker.

MR. ALPERN: Hi. My name is Ken Alpern. I'm president of the Transit Coalition.

First off, I want to thank the Metro staff doing this project for a more comprehensive outreach program to different parts of the region. I think just as this regional connector will affect people from throughout the county, I do appreciate you doing outreach to the different populations to be affected throughout the county.

I think this connector will be sorely missed in about the next one to two years when the East side and first phase of the Expo Line opens.

People that don't quite understand the need for this will suddenly realize in a very big way how important this project is, and it is my understanding

from speaking to my other colleagues on the Board of the Transit Coalition that the subway portion is what is preferred. Certainly we want to do things at grade and inexpensively whenever we can, but for something of this nature where I think the headways and ridership will be something that will be much higher than any of us ever could have dreamed, just as within a few years the Orange Line bus way suddenly became at capacity in ways nobody could have dreamed, I think the subway will be a project we'll be glad we did; and if we do not do the subway, we will sorely miss it because, again, the ridership and

headways and capacity will be much greater than any of us ever could have appreciated.

And I appreciate again your outreach and wish you all the best of luck as you pursue this vital project. Thank you.

MS. KERMAN: Thank you. We still have two minutes taking public comments.

I'm going to give Steve Bagby two more minutes.

We have two minutes, so go ahead, Steve.

MR. BAGBY: Thank you so much.

For the sake of objectivity, I just wanted the Expo Line and MTA to be aware of the potential perception of environmental racism involved in this. And I'm not real comfortable using that word; however, the reality is

that as best I understand, there's 140 million dollars being spent to go from Vermont and Exposition to La Brea

and Exposition, 140 million dollars to go 4.5 miles.

It's 185 million, 45 million dollars more, to go one mile from La Cienega to Robertson.

Now, where is the equity there?

At the same time, we're hearing other projects, the proposed Subway to the Sea starting at the Miracle Mile on Fairfax and Wilshire going to Santa Monica, totally underground, where the minority community at Vermont, Normandie, Western, Arlington and Crenshaw, our major corridor which is wider and does more traffic than La Brea or La Cienega, is being impacted with trains, maybe up to 30 times an hour.

Now, at La Brea and La Cienega, where you have a lot of Anglo-Saxons, more upperly mobile people going from Palisades -- excuse me, from Palos Verdes to Hollywood, they can -- it's a flyover at La Brea and it's a flyover at La Cienega, but we can't get a flyover at Vermont, at Western, at Crenshaw. So the answer to this would be ideally below grade. That would be the ideal situation. But at the very least, where it impacts schools like Ted Alexander Medical Magnet right here at Figueroa and Exposition, Foshay Learning Center and Dorsey High where students are impacted, it should be

either below grade and under grade, and it should be flyover like La Brea and La Cienega at those major corridors that I alluded.

Thank you so much.

MS. KERMAN: Thank you very much.

It's now 6:00 o'clock. I will officially close our public hearing. Thank you all for coming and goodnight.

(Proceedings concluded at 6:00 p.m.)

Pasadena, California, Tuesday, March 31, 2009

6:00 p.m.

ANN KERMAN: Thank you, Dolores.

At this point we're going to open up the meeting to public comment, and we're going to do so for the next 50 minutes, or so. We are going to be here and take comments until eight o'clock.

So, you know, feel free to make those comments. Again, if you would like to speak, please fill out one of these cards. They're available at the back table. Raise your hand, and we'll get you one.

What I'm going to do is I'm going to review the protocol with you quickly. And again, I'm going to call three people up at a time, just so you're ready to come on up. We will have two minutes for each presentation, for each speaker. Please state your name clearly.

We have a court reporter with us who would like to take down every word that you say tonight. And please, again, address your comments to the project purpose and need. The project alternates, and potential impacts and mitigations that you think we should be looking at in this portion of our study.

So with that, I would like to begin our public

comment portion, and I will call up Craig Thompson, followed by Jerard Wright, followed by Elisabetta Taffoni-Burke.

CRAIG THOMPSON: Okay. Craig Thompson, from the Citizens For Better Mobility. And the one thing I see here is that there has been a route that has never been considered. And that is taking the connector down Alameda Street to Washington Boulevard, making a Westwood turn onto Washington Boulevard to connect to the pre-existing Blue Line. And also, to have a double-track wide connected not only at that location, but also Washington and Flower Streets to connect with the Expo Line.

Since I see that the purpose of a downtown connector is to connect to all of rail lines, all the Light Rail lines. This would look like it would be the connector that would be the lowest in cost, and would allow for money to be put forward -- put toward the grade-separation of the extraction on Washington Boulevard and along Flower Street to be placed in the covered tunnel, that way we would have an improved Light Rail Transit System with higher speeds, greater reliability, great safety, and higher passenger capacity.

We do not need to take this line through the

heart of downtown simply because of the fact that we have the Red Line doing that. If you want to make a connection

through the heart of downtown, the Red Line will be there.

Furthermore, if you're going to complain about the money you're going to spend, why not petition the MTA to allow that to be become a free transfer zone? Anyone buying a rail ticket could ride that segment of subway between Union Station and 7th and Metro Center absolutely free.

Thank you.

ANN KERMAN: Thank you, Mr. Thompson. Next up, Jerard Wright, followed by Elisabetta Taffoni-Burke, followed by Albert Taffoni.

JERARD WRIGHT: All right. Good evening, everybody. I hope you can hear me. I'm just glad this process is actually out here in Pasadena and outside of downtown because this is more than just a downtown project. It does impact Pasadena. It impacts Long Beach and it impacts other future rail corridors that the system will connect to. The one main interest the Interest Transit Coalition has first of all, is that particular Y.

Just looking at what type of mitigation, other than pedestrian bridges, you know, looking at the -- working with the L.A. DOT with implementing a traffic study or traffic plan while on Temple or Second to kind of do a one-way street. Something to mitigate that particular

crossing and even just close off the First Street portion

for auto traffic and just leaving that as a pure train walk uninterrupted, unimpeded.

So that's the main interest, but I'm so glad to see this process pushed forward and I would like -- love to see this open by 2016. We need this desperately. We desperately need this project. And thank you for your time.

ANN KERMAN: Thank you, Mr. Wright. And next, Elisabetta Taffoni-Burke, followed Albert Taffoni, followed by John Laur.

ELISABETTA TAFFONI-BURKE: Hello. My name is Elisabetta Taffoni-Burke. I'm a resident of Pasadena and I came here because I would like to bring to your attention and bring in consideration, to not to have the Light transportation above ground.

I see that directly leaving here in Pasadena, on California Boulevard, I see the impact that the Light Rail has when it comes out of Old Town and goes to Del Mar, California and Glenn. Where there is a back up of traffic in the rush hours for long time.

And Pasadena will have much more inhabitants in the near future. So I really think downtown being such a busy center would really be ineffective by the Light Rail on the ground.

25 I am Italian and I come from Rome and I was born

and raised there. And we have a Metro, and Metro has been built through difficult time, to begin. Because Rome has monuments underground, but it is underground. I really think you should consider not to have anything on the surface. This is my suggestion.

ANN KERMAN: Thank you so much, Ms. Taffoni-Burke. Albert Taffoni, followed by John Laur, followed by Ken Ruben.

ALBERT TAFFONI: Well, as a senior citizen, I feel that I represent probably seems to be the oldest person here. I remember Los Angeles, especially downtown when it was Old Los Angeles, the tunnels and hills and Bunker Hill. Practically that's all been destroyed.

Now, they're deciding to put a surface line on Second Street tunnel, when I've seen all the other ones destroyed. If they're insisting that they go that route on Second Street, underground is the only way to go.

Light Rail or not or keep it the way it is. Mr. Thompson had a very good point if it's above ground, we all need it. And the other street where the Blue Line is located, we're discussing right in the center and it should be underground, no other choice.

No way in destroying that tunnel. We don't need heavy passages. We want the people to be able to

walk. We want the cars to have a place to park, and the

parking structures, but we need an underground system.

That is the only way to go. It will cost a little bit more money. We've already destroyed -- because we never connect with anything, over and over and over and over. Thank you.

ANN KERMAN: Thank you Mr. Taffoni. Next up John Laur, followed by Ken Ruben, followed by Harold Leacock. I'm sorry. John Laur?

JOHN LAUE: L-a-u-e, is the last name. And I used to work as a transit coordinator for the City of Pasadena, so I'm pretty familiar with the early planning stage. And it's a real crime and tragedy that the thing wasn't done in the beginning because now we have to rebuild it, but that's water under the bridge.

I am actually in favor the at-grade alternate. Because I think that Downtown L.A., one thing -- I mean, downtown L.A. after 5:00 o'clock is pretty dead and there is a need for a life there.

If you go to San Diego, Sacramento, there are many, many cities where Light Rail -- Light Rail is -- Heavy Rail is for subways, Light Rail is for at-grade, and it could be done -- if it's done in the right way, Light Rail through downtown with additional stops, I really believe that there

needs to be a stop in the Broadway area between Broadway and Spring Street.

If you're going to use Light Rail downtown, make sure it has stops where people need it. And the below-grade is a viable alternative, but the cost needs to be looked at. I don't believe that there's just a $200,000,000 difference in cost between these two. I can't believe when somebody said it's $700,000,000 for the at-grade and $900,000,000 for the below-grade. I don't believe those costs are accurate.

I also think this the gentleman here had a really good suggestion as far as another alternative -- I don't know why this wasn't looked at, but they're talking about getting transit through one end to the other. That would be the way to go.

But I think that the idea, you know, go to Downtown L.A., you don't really see any sign of the transit. And, I mean, at that time -- rail transit -- so you see subway stairs. We want to get people out of their cars and using the system. You need to have some visibility, which we don't have right now.

And I don't think we should be designing systems for the benefit of the car. So the cars have to wait for a while at certain stops at-grade, too bad. You know, we need to be putting transit at forefront and pedestrians, and not the convenience of cars in Downtown L.A. Thank you.

ANN KERMAN: Thank you very much, Mr. Laue. Ken Ruben, followed by Harold Leacock, followed by Brigham Yen. And

I'd like to also invite, if anyone else would like to speak, please fill out a card.

KEN RUBEN: Ken Ruben, I've lived in L.A. most of my life and there are several friends of mine here tonight. Some are more expert on the downtown connector than I am, but I've read putting the Gold Line here. Today, taking the Red Line to the Gold Line, walking to Union Station, something that would be eliminated with the connector.

They asked Ray earlier about if the lines would actually operate from the connector to the Blue Line going to the connection with the Gold Line. And then, would you go to East L.A., Pasadena, or both, and he said it would be both.

And it's the same, I've been told, going south, it would go to Long Beach and Culver City. Incidentally, I live in Culver City and the Expo Line will only open as of right now, unless there's somebody at the meeting -- Jerard and I were talking about Thursday at the Exposition Authority, whether it would open -- it would open at Crenshaw, not Culver City, till 2011, that was mentioned earlier.

Anyway, my point was that there's so many different aspects. As far as the connections are concerned, just really in the last few days, I like an underground only

because I know the traffic on the bus through downtown.

I've ridden every major -- I think most of the major lines to downtown and there's too much traffic.

I know subway would be a lot more expensive, and I don't argue that. If you have it through the subway, and then connect with the Gold Line down Alameda and what, First?

So far where it's being built now, you have a better chance of less traffic. Personally, I like Light Rail all over the place. Like I said, I was on -- in fact, I think I'm the only one here who was actually on the first run of the Gold Line out of Union Station with 36 others.

And that -- well, I wasn't mentioned. Well, others were, as far as back in 2003. So there's a lot of factors. I'll have to talk to Craig about his proposal. I think I'm out of time so anyway those are some of my comments. Thank you very much.

ANN KERMAN: Thank you, Mr. Ruben. Harold Leacock, followed by, Brigham Yen, followed by Richard Powers.

HAROLD LEACOCK: Good evening, everybody. My name is Harold Leacock, for the record. I'm associated with the Citizens Of Better Mobility. It's known as a think tank for better rail travel around Los Angeles.

And I appreciate coming -- this my first time speaking at one of these. I've been to many of the scoping

meetings, but I'm just a listener, but not really a

commenter. I'm glad I have a chance to comment.

My take on this, on your page four, on your sheets here, is the underground portion. I know I disagree with my co-partner, Craig Thompson, because he's a rail lover from New York, like I am.

And my take on the underground is better because right now the system is going to go through a dense population. When you have dense population, it's the best thing. And it's a low impact system underground. You don't want to be coming above ground in a highly dense population because right now, the Gold Line is built in east side.

It took a great impact because it's a surface extension. A lot of businesses suffered. So I'm in favor of the underground portion of this connection problem, or solution here because it's low impact for businesses.

The line is already underground at 7th Street. It's just a matter of digging a tunnel to connect over to Little Tokyo. And the portion that was dug for the Gold Line going to the east side was 1.8 miles, I think it was. And it didn't take very long to dig that tunnel through. I'm sorry. I'm out of time, but I am for the underground portion. Thank you.

ANN KERMAN: Thank you Mr. Leacock. Brigham Yen,

followed by Richard Powers, followed by Whitman Lam.

Brigham left? Okay. Richard Powers.

RICHARD POWERS: My name in Richard Powers. I'm an instructor at Los Angeles Trade Tech. For the past 14 years I've been commuting from Pasadena to Trade Tech to give classes nine months a year.

I -- at the beginning, I used to go completely by bus from San Marino to the 79 Line. When the Gold Line became available, I began taking the Gold Line, but it actually means taking a bus to the Gold Line to the Red Line to the Blue Line.

From my experience, I find it would be marvelous if I could be taking the Gold Line to Trade Tech or when I go to LAX. I would have at least two less transfers. When I fly, I have to transfer five times to get to the airport, and it takes two-and-a-half hours.

And I'm concerned about any at-grade alternative because from any experience on the bus, whenever there was a demonstration from the city hall, or there was a major funeral at the cathedral, traffic downtown was disturbed and buses ended up going various places.

You don't want that. You want to be able to the depend to get to where you need to go and know that there won't be about demonstration or funeral stopping from beginning your class on time. Thank you.

ANN KERMAN: Thank you Mr. Powers. Next we have

Whitman Lam, followed by Jim Shafer, followed by Joel Covarrubias.

WHITMAN LAM: Hi my name is Whitman Lam. I'm a member of the Transit Coalition. Now, I mean, look at other cities. You know, we have been to other cities; right? And, you know, you see how useful their transit systems are, how efficient they are, how many people are using them.

Not just, you know, just on the weekends, but actually using them in their daily lives. I've been to New York. I've been to Boston. I've been to San Francisco, London, Paris, you know, Berlin. And I mean, it's a totally different world out there.

And none of the people here -- a lot of us an Angelinos don't realize that way of life, you know. London has an underground. New York City, underground. Okay. Paris, underground. Why not us? Why do we have low expectations for transit systems?

You know, I think that we need to invest more. I think that people -- you know, this is a good thing. People are here. People know the importance of mass transportation. You know, all of you bring your friends, bring your family next time, okay.

You know what, let's get on the bus. Let's get on the train. Okay. Let's get the city moving. This is a

very positive thing to have all you guys here. And you know,

I think that, you know, when we empower ourselves, when we come to these meetings, when we bring out ideas, you know, ideas -- I mean, all over the world, Tokyo.

Everywhere they've already got their thing built. Okay. They've got their, you know, they're connecting systems. They've got high speed rails, which we don't have. I mean, they have trains that actually go to the airport, not just stop, like, a mile away. Come on, let's hop on the bandwagon on here. Yeah, go team.

ANN KERMAN: Thank you, Mr. Lam. Jim Shafer, followed by Joel Covarrubias. And again, I invite anyone that would like to make a comment, raise your hand, we will get you a comment card.

JIM SHAFER: Hi, my is Jim Shafer. I want to speak very enthusiastically in favor of the project in general, especially the underground alternative.

I live a couple of blocks away from -- well, I live at Fourth and Main, so this would be incredibly useful to me and all the other people who live downtown or moved downtown in the last ten years. Not to mention the people who already were living there.

And the idea of having a train go down Alameda to Washington is a great idea, but to me, in addition to

this project, to give more access to parts of downtown. And I also like the station placement that you're thinking of.

Especially the one serving Bunker Hill and the office workers up there and the cultural buildings, Disney Hall Music Center, as well as the one right by the new police station at Second and Main and the one over by the library.

So I've also lived in a place that has really good public transportation. I lived in Mexico City for three years. It's not a perfect system, but it is very easy to get around the city using their Metro. Like, I don't know, 200 stations that cost a dime, and you can transfer as many times as you want. So I also agree to move in that direction. Thanks.

ANN KERMAN: Thank you very much, Mr. Shafer. Next I have Joel Covarrubias. And again, I invite anyone that would like to speak, raise your hand, we will get you a speaker card.

JOEL COVARRUBIAS: Hi, I don't have any prepared remarks. I just dropped in here, but I did -- I am a long time transit rider. I took the Blue Line on it's first day and was disappointed when I only got to Pico Station. Didn't quite make it all the way underground. And it took a little while before they eventually built it all the way under to Metro center.

And even when that happened -- even when that opened up, you know, you couldn't help but think about the

possibilities of just continuing on to Pasadena. They had

the little sign up there at the top that said, "Blue Line to Pasadena." Eventually, they -- I don't know if they took that out or what.

Anyway, it will be good to see this train when it eventually gets built. Travel all the way through downtown and get to the other side. It's a long time coming. And as other people have said, you know, this is a no-brainer.

You know, this is the type of thing that other cities have had for decades. So, it's real good to see all of the enthusiasm in L.A. right now for transit measure or passing.

So let's not skimp on it. Let's do to right. Let's put it underground. I like the underground option. It hits some good locations, Bunker Hill, the Central Library, the City Hall, all of that. So let's do to right and not cut corners. Thank you.

ANN KERMAN: Thank you very much. Well, it's now 7:30. We are going to be here until 8:00 o'clock. So if anybody else is brave enough to come to the mic, we'd be delighted to hear from you.

If you prefer to put your comments in writing, again, we will be here for another half hour. Take the time. Write them out for us. There will certainly be

other ways for you to be in touch with us. Again, we

are taking comments through May 11th and we want you to stay informed with this project.

So to do so, you may log into our web site. It is Metro.net/regionalconnector. We will be engaged in the community throughout the process. So stay tuned because there will be further follow-up meetings for all of you that would like to attend.

And make sure that we have your correct contact information at the registration desk so we can keep you on our e-mail list; keep you posted when our following meetings will be. And again, feel free to check in at the web site.

So with that, we're here. The boards are in the back. There's cookies, coffee, water. So please, help yourself and I thank you all for being here tonight.

(Proceedings concluded at 8:00 p.m.)

Los Angeles, California, Wednesday, April 1, 2009

6:30 p.m.

MR. AGNEW: Hi. My name is John Agnew, no relation. Firstly, I'd like to say that I'm a huge fan of Transit and Light Rail. I'm originally from Australia, where we have a lot of light trains. So I'm a big fan of this, and I regularly ride both of these lines.

I go out to Arcadia to get my car serviced, and I've ridden my bike down to Long Beach a number of times, and I even caught the train back. So I'm familiar with both of the lines that you guys are proposing in connecting.

I'm very much in favor of the system being built out; however, with that being said, I'm very much in favor of the below-ground option. Mostly, I see, driving around town, the Blue Line and the traffic congestion that happens.

I think it's also going to be safer to be below ground, quieter, and also for aesthetic reasons, it would be nice if it was below ground.

Thank you.

MS. FILGIOUN: Thank you very much, Mr. Agnew.

Joan Springhetti, Russell Brown.

Sorry. We'll start you off at two minutes.

MS. SPRINGHETTI: Good evening. My name is Joan Springhetti. I'm here representing the Higgins Building, which is at the intersection of 2nd and Main, which is on the route.

The homeowners' association, like many of our neighborhood residents and business leaders, and stake holders, wants to reiterate in the strongest terms our support for the responsible building of the Regional Connector below-grade project and our categorical objection to opening it as an at-grade project.

As you consider your proposal, we ask that you consider the many benefits of the below-grade project over the at-grade project. The below-grade option will allow for greater efficiency of the regional transit system. It will be safer. It will be less disruptive. It will encourage a pedestrian-friendly downtown.

It will cost the city less in the long run, and it will improve the quality of life for existing and future downtown residents. 2nd Street is part of the functional historic and fine fabric of downtown. Converting it into a rail corridor would be devastating.

While building this project below grade will

also create significant disruptions, we believe many of

those can be mitigated. If built responsibly, this project can be an asset for downtown residents, workers, and businesses as well as for cross-county travelers.

Thank you.

MS. FILGIOUN: Thank you.

Russell Brown, Dennis Allen, and James Okazaki.

MR. BROWN: Russell Brown. I'm president of the Downtown L.A. Neighborhood Council, also executive director to the Historic Downtown B.I.D., and chair of the district for our community for downtown.

All three groups have been very involved in this process and unanimously support the underground proposal and have very, very significant concerns about the above ground.

Any demonstration that happens all the time; filming, a single car blockage, a pedestrian, a dropped package, a stroller, any kind of traffic accident will literally paralyze the entire system in the county.

All you have to do is look at Washington Boulevard, and you can see what an unfriendly neighbor the rail down the middle of the street -- now, if this will be the entrance to the related project, Grand Avenue Park, and the Historic District, you'll literally be bisecting the neighborhood.

Also, if you look at what this will do in

splitting Purple Tokyo, that's not very pedestrian friendly. Also, we have significant concerns about the location of the station near Caltrans and Vibiana with the 150-year-old cathedral, and we suggest a linkage much closer to Broadway and Hill that would align the two lines of the proposed street car would also connect with the Red Line.

So you could have stations both in the north and south in order to connect up with the Red Line, and also, to offer significant transporting and development opportunity near the gateway that is at 2nd and Broadway.

Also, all you have to do is look at safety and security concerns at City Hall. To have transit on both sides of the City Hall, you can also block the entire system.

Thanks.

MS. FILGIOUN: Thank you, Mr. Brown.

Followed by James Okazaki and then Mizue Katayama.

MR. DENNIS ALLEN: Hi. My name is Dennis Allen. I'm with Los Angeles Streetcar, Inc. We are a nonprofit organization with the goal and intention of building a modern day streetcar system in downtown Los Angeles.

First of all, I'd like to give our absolute

support of the Regional Connector. We're obviously big fans of public transit, and I think the Regional Connector makes a lot of sense for connecting all of the transit projects in Los Angeles.

Secondly, we would like to express also our preference for the underground alternative for the Regional Connector. One of our goals as a regional circulator -- or an internal circulator in the downtown area, we've tied into transit as well as we possibly can.

I think that the underground alternative does that best, as well as puts the station a little closer to Broadway and Hill and some of the other proposed routes that we're looking at as well. So all those things in mind, I think we definitely prefer the underground alternative.

Thank you.

MS. FILGIOUN: Thank you very much, Mr. Allen.

Do we have any more speakers cards that I can add to my stack as we wait for Mr. Okazaki?

Thank you, Mr. Okazaki.

MR. OKAZAKI: James Okazaki. I'm representing the Nisei Week Foundation. I'm also a member of the community council. Myself, being a professional

transportation, having worked on every single rail type

projects, I support and our organization supports the subrail, not the at-grade and definitely not the T.S.M. existing system.

Obviously, for safety, schedule reliability, and performance, as well as disruption -- having less disruption and construction, I do want to stress some of the things that need to be done in work that the A.A. did not do, and that is both detail analysis of traffic.

Particularly, the capacity and operation on analysis on 1st and Alameda, where you're going to have an at-grade alignment across Alameda. The station location also is a little problematic for little Tokyo because east side Light Rail is not going to stop at Little Tokyo.

And I know you're calling the station between Main and L.A. Little Tokyo Station, I think Little Tokyo would be between L.A. and San Pedro. And T.O.D.'s possibly there, too, on the related project site.

I know you got to push to the West and you gotta push to the East. And maybe that's why you selected the site, right in the middle, opposite the -- we would like -- the Little Tokyo community would like to have the station further east considered.

The last thing is the concern about

construction impact. Even if you do your tunnel work,

there's going to be some impact, and we want to make sure that doing the construction with the station as well at the tunnel operation, that you definitely work towards mitigating all the impacts.

Thank you.

MS. FILGIOUN: Thank you very much, Mr. Okazaki.

We have Mizue Katayama, Ryan Stern, and then Edie Glass.

Mr. Stern -- Ryan Stern, do you mind coming up next?

Edie Glass, and then Debbie Kim.

MR. STERN: Hi. I'm Ryan Stern, and I'm a neighbor here at Little Tokyo, and like everyone whose come forward here, I absolutely support -- I'm ecstatic about this project.

I was helping to convince people to vote yes on Measure R. I would show them a picture of the Regional Connector map. And sometimes they would confuse it for B.A.R.T. up in San Francisco. I say, "No, this isn't San Francisco. This is what L.A. could become."

To the people that are using doom and gloom to describe the above-ground covert, let's not go really crazy. I used to live in Culver City, and there were a

lot of people that were freaked out about the Expo, and

a lot of people are still freaked out about the Expo Line and describing the above ground as highly disruptive.

Guess what? We've got sirens; we've got busy streets. We live in downtown. Downtown is disruptive, but downtown is also very dense, and I think that the density of downtown, unlike Culver City, where I used to live, does make the underground option of a little bit more of a useful thing to explore surface rail down here to be frequently stopping and should give a lot of possibility to commercial businesses.

And I think that from the Regional Connector, we need to preserve the rapid transitness (sic) of the current Blue Line and Gold Line. So there's a balance that needs to be struck. I wouldn't say that we shouldn't get all bent out of shape about the above ground option.

It has to be explored, but I think that the preference, at least in my opinion, again, would be going for going below grade, and I think that's all I have.

Thank you.

MS. FILGIOUN: Thank you very much, Mr. Stern.

Edie Glass, Debbie Kim, and then Bryan Allen.

MS. GLASS: Hello. My name is Edie Glass. I've

been a rider of public transportation for many years. I would like to say that I'm very much in favor of this project; however, where it's necessary for an at-grade construction, I'd really like to see more green spaces.

I spend a lot of time waiting in the area where I'm taking public transportation, standing in the sun where there is absolutely no shelter. I think that if we're really concerned about the environment, we would create more green spaces around the areas where the buses stop so that we're not sitting, waiting in no shade, rather than making those spaces into parking lots where more congestion would exist. We should have an opportunity to sit and have more shade and green.

MS. FILGIOUN: Thank you very much, Ms. Glass.

Debbie Kim, followed by Bryan Allen.

Before Ms. Kim starts, do I have any more speakers cards that I can gather up?

Thank you, Ms. Kim. Go ahead.

MS. KIM: Good evening. I just wanted to share with you just the perspective from someone who lives at the Higgins Building. We're on the route on the 2nd Street and Main Street, and I live on the second floor.

So that would be exactly -- if we were to go

with the at-grade, I would be looking right out my

window at the cables, I think, and the cars going by. And I think the hours were all week. I think -- I don't know -- past nine o'clock. I mean, it would be all night.

So basically, I live on the second floor. That's my house, my home, and I would be looking out my window, and this is what I would see. So obviously, the underground option would work for me, and, I think, for everyone that lives there. And that's just from my perspective of course.

But as Joan pointed out, that's our little neighborhood. I have a dog. We walk our dogs right there. I see neighborhood families with their children, and we know those accidents that happen up in those areas where the metros have accidents easily.

And I can't imagine having something like that right at 2nd and Main. That would be a disaster. So underground is definitely the way to go.

Thank you.

MS. FILGIOUN: Thank you, Ms. Kim.

Mr. Allen.

MR. BRYAN ALLEN: My name is Bryan H. Allen. Obviously, I'm a bicyclist. And I have a 31-year history of observing the institutional investigations in

this county since 1978.

First, I must protest -- legal -- I must lodge a legal protest against the two-minute limit described here. The C.E.Q.A. document and the N.P.A. document will be comprised of tens of thousands of words. To limit people's testimony on that scope to two minutes is legally not reasonable, especially considering the small number of speakers here tonight. I expect having to engage attorneys to represent me on this point, and I solidify here.

Ladies and gentlemen, the formal purpose of this meeting is to refine the scope of the C.E.Q.A. document, the Environmental Impact Report, and the N.E.P. document, the Environmental Impact Statement.

How many of you here have actually bothered to read the guidelines of -- or speculate under the California Code of Regulations that actually bothered to read the guidelines for the preparation of the E.I.S. and the Code of Regulations?

I have.

Let me see the hands of those of you who have also reviewed these documents.

Uh-huh, as I expected.

Ladies and gentlemen, especially the C.E.Q.A. document -- the state document -- the scope of it is

limited to considering only the potential adverse

impacts upon the physical environment. It is not even permitted to consider the social impact or social benefits of a project except in considering the significance or insignificance of a proposed impact or predicted impact upon the physical environment.

Ladies and gentlemen, most of the comments, excuse me, here today, unfortunately, are legally not relevant. I have seen many reports in the past. I've participated in many. Most of your comments will say something like "comment noted" and do nothing more than that. Because unfortunately, they have not bothered to inform you of your duty under law to testify and moreover --

MS. FILGIOUN: Mr. Allen, your time is up.

MR. BRYAN ALLEN: They refuse to --

MS. FILGIOUN: Mr. Allen, I'm asking you --

MR. BRYAN ALLEN: I shall conclude by saying that I request --

MS. FILGIOUN: -- to keep your comments under two minutes like everyone else --

MR. BRYAN ALLEN: I request that all non-C.E.Q.A., non-N.E.P.A. documents be addressed by the F.T.A. and the L.A.C.M.T.A. in an appendix --

MS. FILGIOUN: Your comments are being recorded.

Thank you very much, Mr. Allen.

Mr. Charles A. Adelman. Thank you, sir.

MR. ADELMAN: Hi. My name is Charles Adelman, and I've ridden transit all over the world, basically. And my first comment is: Picture a train coming down 2nd Street every two-and-a-half minutes in each direction. It's already a busy street. That doesn't work. Major traffic tie up and major traffic congestion. It needs to go underground.

Second problem, the proposed junction, Alameda and 2nd. A single-level junction, as it is being proposed here, is either going to bring separate streets by elevating the street over it or running the street under it, still cannot accommodate a train every two-and-a-half minutes in each direction.

It really needs to be split-level junction underground. And it needs to be predesigned so that that station can preserve all trains.

Thank you.

MS. FILGIOUN: Thank you, Mr. Adelman.

We are here through eight o'clock. So we will continue to take comments up until then. So, again, we ask that you limit your comments to two minutes, should you like to speak.

Please state your name.

MR. PASS: Gerald Pass. Just real quickly, I did

write the -- and I never got the chance to actually say it.

I just really believe that the east-west alignment, the actual names of the routes should be reflective of single directions one way, which is to say that the east L.A. extension, the Gold Line, I think, should remain Gold; whereas, the Expo Line can take on -- remain Gold.

MS. FILGIOUN: Thank you, sir.

It's now about 7:30, and we will continue to take your comments, as I mentioned earlier, until 8:00.

We have JoAnne Kumamoto. Thank you, JoAnne.

MS. KUMAMOTO: Thank you. My name is JoAnne Kumamoto, and I'm with the Little Tokyo Community Advisory Council. I was going to give my time to James. I think we both agree on this discussion, but James has the notes.

MR. OKAZAKI: Thank you, JoAnne.

MS. FILGIOUN: Keep it to two minutes, please.

MR. OKAZAKI: I would like to put on the record that JoAnne and I have been talking for a while, and we've been analyzing the station spacing, and we thought the east-west alignment along 2nd Street kind of got gypped in choice of number of stations.

25 The proposal talks about a single station

between L.A. Station and San Pedro, and I think the Little Tokyo community wants to support the -- all the activities that have been proposed to Broadway, including the trolley rail.

So I think they should give a station near Broadway, but Little Tokyo would still like to get a station. We think there should be two stations along the east-west alignment between the Music Hall and the 1st and Alameda Stations.

So looking at the spacing of the stations, we think that makes more equal distance for walking to these stations. So we're recommending that the environmental impact analysis -- that you take a look at an additional station on 2nd Street.

Thank you very much.

MS. FILGIOUN: Thank you, Ms. Kumamoto.

(Proceedings concluded at 8:00 p.m.)

Los Angeles, California, Monday, April 2, 2009

12:00 p.m.

MS. KERMAN: Thank you, Dolores. We're going to get set up here with our second mike and what I'd like to invite all of you to do is if you wish to make comments today, to fill out a speaker card.

Can you hear me? Good.

Fill out a speaker card. I will be calling up three names at a time and what you will then do is you'll have the two minutes to speak. We will be capturing all of that by our court reporter and we will be here until 1:30 taking comments. So even if you're done speaking, we'll still be here, just in case you want to come up and make a comment.

As you come up, you'll be speaking from the microphone to your right. I ask that you state your name clearly for the public record.

And we again welcome all of your comments.

First up, Craig F. Thompson, followed by Kymberleigh Richards, followed by Arnold Sachs.

MR. THOMPSON: I'm Craig Thompson, founding member of the Citizens for Better Mobility. And we believe that

25 although the Downtown connector is a very good idea,

these two alternatives look quite expensive (indicating) when a cheaper alternative and one that functions just as well exists. It is quite possible to take this line straight down Alameda Street to Washington to make the west turn on Washington to hook up with the preexisting Blue Line.

Furthermore, there could be also a junction installed at Flower and Washington to make the connection to the Expo line.

Why do we have to spend so many millions of dollars on tunneling when it could be saved just by dropping in two stations, one at Seventh and Alameda and the other one at Olympic, and you've got your low-cost connector and it achieves all of the purposes of the connector without the high cost of tunneling.

Thank you.

MS. KERMAN: Thank you, Mr. Thompson.

Kymberleigh Richards, followed by Arnold Sachs, followed by Scott Sookman.

MS. RICHARDS: Thank you, Ann. I'm going to face the counter.

Kymberleigh Richards, Public and Legislative Affairs Director, Southern California Transit Advocates. We support the underground option. Given the traffic

issues in Downtown Los Angeles, we believe even having

part of it at grade would create operational problems and would actually worsen the mobility for those that continue to drive in the Downtown region.

In direct response to the previous commenter, knowing what I know about Alameda Street, I don't believe that's a viable option because these two options create station location within the heart of Downtown, which is where the people are that need the service. Alameda is at the eastern edge of the Downtown area and, quite honestly, there would be much more of an interconnectivity issue there. To operate along Alameda would require additional feeder bus service, which does not now exist, in order to get from those stations into the heart of Downtown.

For that reason, I am inclined to reject the previous commenter's suggestion. And, again, we are in support of the underground option which is contained within the presentation.

Thank you.

MS. KERMAN: Thank you, Kymberleigh.

Next up, Arnold Sachs, followed by Scott Sookman, followed by Nate Zablen.

MR. SACHS: Good afternoon. Arnold Sachs, a transit rider. Your example of three transfers for a trip from

Pasadena to Staples Center, maybe you can explain to the

public why the 1.6-mile gap exists. When the Blue Line was first considered in your original scoping meeting in October, they mentioned that the original -- that one of the possibilities was the original Blue Line plan, which meant that the original Blue Line would have gone from Pasadena to Union Station. Why the 1.6-mile gap exists, if they would have studied that -- the Blue Line opened up in 1990 -- they would have had planning to go from Seventh and Metro to Union Station.

The new part of this project is an at-grade crossing. Why somebody would consider putting the train in front of City Hall, beyond me. Have you tried to get into City Hall lately with the security measures? You're not going to have a train there.

Everything old is new again. This is just reselling old stuff. I'd like to point out that this (indicating) is a flyer you get from Metro. Down in the corner, here is an articulated bus that they discontinued in 1983 (indicating).

They spent a billion dollars fighting a Consent Decree to put more seats on buses. Then in the years -- in early 2000, they came out with new articulated buses. I can't imagine Metro's going to spend 10 million dollars on tunneling equipment to build tunnels from Seventh and

Metro to Union Station and not be able to use that

equipment again.

And just remember, by not building this part of the tunnel in the beginning, it changed the whole infrastructure for the Metro plan and for the Red Line also.

Thank you.

MS. KERMAN: Thank you, Mr. Sachs.

Next up, Scott Sookman, followed by Nate Zablen, followed by B.H. Allen.

MR. SOOKMAN: Hello. My name is Scott Sookman. I live Downtown.

As far as the last commenter goes, I think we probably would be here until the sun went down if we went into all the reasons why the Blue Line was not connected and constructed to Pasadena in 1990, but there probably were three reasons at the time, and those were politics, politics, and politics. I just have a couple of points.

Looking at this system and what it does, I think it's a very good value for the money. If you look at most Metro systems around the world, what a lot of them or most of them do is they have services sharing the same tracks, and that's what this would allow the Metro system to do; provide trains going to different destinations,

sharing the same tracks, and that adds a lot of utility to the system as a whole. It allows people different

choices in destinations and where they're going. And now, since we're going to have a line going to the east, we're going to have the Expo Line going out to the west, we've got almost every point of the compass covered once those open, so in order to connect all those points of the compass, this is a very good project.

It has to be underground. Quality doesn't cost. It pays, since we have the Measure R funds available, since we have hopefully some Stimulus Funds from the Federal government available also.

Let's invest in a grade-separated route, the Regional Connector underground, and let's add a lot of utility to the Metro Rail System and let's make it a world-class rail system.

Thank you.

MS. KERMAN: Thank you, Mr. Sookman.

Next up, Nate Zablen, followed by B. H. Allen, followed by Tracey Chavira.

MR. ZABLEN: I'm Nate Zablen, and I'd like to suggest the underground alternative to me would be the best. It would avoid a lot of the traffic and possible delays you get with the demonstrations and pedestrian traffic, so I think the underground alternative is preferable.

On the other hand, though, I do think there

should be a station closer to the Civic Center; in other

words, City Hall, the Federal Building, the Federal Courthouse. You have a lot of potential riders there and there's a lot of traffic.

I think the present station on Second Street is a little far from the center and I think to attract a lot of riders and make it work, we need people commuting. They should have it right near the City Hall area and the Federal building.

Also, I think it should be possible for a transit rider to take the train from Pasadena and go all the way to Santa Monica. I think there should be through trains not only from Pasadena to Long Beach, but from Pasadena to the Westside. I think that would encourage a lot of riders and make it easier; and, also, to University of Southern California, an important employer in this area, which a lot of people work for.

So I think these are alternatives to be considered and, also, it's important to get that station as close as possible to the Disney Hall and the Music Center so you can just get out of that station and just walk up to it.

This is a little bit further, but I think -- I favor the underground alternative, but I think there should be some moderations to encourage a greater

ridership and make it more convenient for people from

other parts of the region to get through and go take the train all the way to their destination, not having to transfer.

Thank you very much.

MS. KERMAN: Thank you, Mr. Zablen.

Next up, B. H. Allen, followed by Tracey Chavira, and I'd like to invite anyone else that would like to speak to fill out a card. You can raise your hand.

Mr. Allen?

MR. ALLEN: For the court reporter, my name is spelled B-r-y-a-n A double l-e-n.

Obviously, the helmet advertises that I am a nonmotorist bicyclist. I have painful experience through nearly 31 years, since I was a young adult in 1978, observing the institutional and bureaucratic failures in transit in L.A. and Orange Counties.

The LACTC first studied the Downtown connector in the Pasadena Line at UNO Initiative in 1986, not 1990, ma'am, and in the Long Beach Line from 1982 to 1985.

MTA failed to tell you, ladies and gentlemen, today's purpose is not to ask you your opinions on what should be built, but to seek --

MS. CASE: Mr. Allen, I've stopped the timer. I've

stopped the timer. You need to move your mouth away from

the speaker so the reporter and the public can hear your comments.

MR. ALLEN: -- but to seek your opinions on what should be included in this scope or range of information of the future environmental document. The State's CEQA and Federal NEPA prescribe what must be included. I have personally reviewed key parts of the regulations in Title 14, California Code of Regulations, and Title 40, California Code of Regulations. By a show of hands, raise your hands, how many of you also have read those regulations? I thought so.

CEQA prohibits even considering social impacts for most purposes; only the significant adverse effects upon the physical environment. Did you know that if you fail to address that, MTA will ignore you or respond with "comments noted," end quote? I bear personal eyewitness to that fact.

Courts have repeatedly held that environmental comments are evidence which the decision makers must consider in addition to other evidence in deciding what they want to do and the project characteristics. Here, the jury analog is the MTA Board and the Federal Transit Administrator. This phase is analogous to the litigant's pretrial haggling over what evidence the jury should read

and no more than that.

Those of you who say -- again, available alternative A and -- go ahead -- alternative B are like those who say link alternative A and free alternative B. It's premature. B is mature and ideal with the evidence required.

MS. KERMAN: Thank you, Mr. Allen.

Tracey Chavira. And, Tracey, before you start, do I have any more cards? You're all welcome to fill out a card. We're happy to take your comments.

MS. CHAVIRA: Good afternoon. Tracey Chavira, Central City Association. Let me begin by acknowledging Metro staff for keeping the process moving along so steadily. Metro staff and consultants have been extremely responsive to CCA's membership and generous with your time, so thank you so much for that.

After participating in the analysis process and analyzing all 33 or so built options, CCA supports the underground option, which for a relatively small difference in cost will generate great benefits.

While recognizing the need to study all four options, I would like to take this opportunity to explain why we favor the below-grade option.

First, it will be impervious to above-ground incidents, making it the most reliable option for

commuters. Second, it's expected to garner the most

transit riders. Third, it won't create street-level visual clutter, which might interfere with revitalization of parts of Downtown. Finally, the regional sector will be competing for Federal funding for its completion.

The underground alternative has the best transportation system user benefit score, making it the best prospect for obtaining medical funding.

We urge you to move this project forward quickly and not go beyond the 45-day public comment time period, since speedy approval will save the County money and get people moving sooner.

Thank you for the opportunity to make these comments.

MS. KERMAN: Thank you, Tracey.

Do I have anyone else wishing to speak? If so, if you could raise your hand, we'll get you a card.

It is now -- thank you. Xavier Grobet?

MR. GROBET: Please. Hi. Name is Xavier Grobet.

I'm a resident here in Downtown and I think the underground proposition is the most interesting. I think it's -- if something -- if an investment like this is going to be done, it should be something that is going to last for a long, long time, and that's what's going to give us the most benefit. But in the meantime, before

that happens, maybe a no-build possibility should be

addressed while this is all done. I mean, there could be a shuttle service or something that starts doing that service from now on until the other option is finished.

Thank you.

MS. KERMAN: Thank you very much.

Roger Christensen?

MR. CHRISTENSEN: My name is Roger Christensen. I am the chairman of Metro Citizen Advisory Council. We have not yet weighed in on the mode for Regional Connector. We are a great fan of the project and I would -- we're busy -- today we're excited about what's going to happen with Exposition, of course. That decision is today.

You know, all it takes is one fender bender, one vehicle making a wrong left turn in this project, and the entire light-rail system is shut down from Pasadena to Santa Monica, to the eastside, to, you know, whatever.

When you're dealing with two-minute or 2.5-minute headways, you really have to have grade separation, not only for the safety of the passengers, but just for the efficiency of the system, and this is the missing link. This is the four-level interchange that the light-rail system has always needed for Downtown. It's not a Downtown project. It's a great

benefit to the entire region.

Thank you.

MS. KERMAN: Thank you, Mr. Christensen.

Christian Allen.

MR. ALLEN: Yeah. Good afternoon, everybody. My name is Christian Allen and I just want to keep it kind of short, but I'm not actually -- I actually do kind of support the underground project because, honestly, it's a lot more efficient. And personally, as a Laker fan, trust me, say they win the championship. Do you really want to see Kobe Bryant on a parade bus getting hit by the 12:25 train to Long Beach? That's all I've got to say.

MS. KERMAN: Thank you very much.

It's now almost 1:00 o'clock. We are going to be here until 1:30 taking comments, so if you decide in the next half-hour you'd like to speak, we'd be delighted to hear you.

There are further ways that you can continue during the next period of days through May 11th to provide us with your comments. There is a comment form that I believe is at the registration desk -- you may have received it -- which you can either fill out today or you may e-mail, fax, or mail it to us. You may go on our website, www.metro.net/regionalconnector and visit the website and make comments that way. You may also

e-mail us at regionalconnector@metro.net.

We will be engaging the community throughout this environmental process and I encourage you to visit the website and stay posted that way. Please make sure that we have your most current information on file so that we can keep you posted by e-mail, by mail, what have you.

And with that, I thank you all for coming. You're welcome to be with us the next half-hour and, again, thank you for taking time during your busy schedule to find out what we're doing here today.

Thank you.

(Recess)

MS. KERMAN: Ladies and gentlemen, I understand we have one more comment. Maria de Lourdes Gonzales?

MS. GONZALES: Good afternoon, everybody.

About two or three days ago, I found the pamphlet. I use MTA on a regular basis and when I found out that there was going to be a presentation here today, I came here today because I was in the building and I came to express my concerns and my questions in regards to some of the frustrations that we have as users on the MTA, and I'm very happy that I have the opportunity to comment and speak on some of these points.

I've sent a letter through the Internet and they

sent me a really nice response, but the point is not to

get just a response, but that they do take into consideration all of the issues that we have as users.

When I sent my letter, I wrote down four points, but I'm only going to talk about three of them. One of them is that it's very difficult to understand why we have to wait so long for the bus, and sometimes one to up to four buses have passed in the same route. I wish I had a camera on me then so that I could take a picture and show what I mean. That's one of my points.

Another is that there be better coordination between the buses between one stop and another stop.

Another point is that when we have the rapid bus, to have better coordination on the stops that are not rapid buses. Some are on one side of the street and others are on the other side or opposite sides of the street.

During the daytime, it's easier -- during the daytime, it's easier to be able to see a bus from far away. And I don't have great eyesight so I have to be on the lookout; but in the evening, it's a lot more difficult when I have to look far away and I have to run after a bus. It's a lot more dangerous in the evening, or to just have to stand there and wait for the next bus to come, and service isn't as frequent in the evening.

25 My third point is that we have to have better

coordination. The Wilshire line, the 920 -- that when they implement a new line, then they remove an old line that goes to Santa Monica. To have a better coordination with the buses, the new bus lines that are being implemented and the old bus routes, so that there's better service for everybody who travels. I don't understand why there is not better coordination between the different bus lines and the different bus routes.

I'm in favor of the system, but that there's also just a better coordination between the buses and the lines.

Thank you for your time.

(Proceedings concluded at 1:35 p.m.)

Dear Ms Roybal Saltarelli,

Please accept this as official notice by the City of Culver City and the Culver City Redevelopment Agency that we wish to become a participating agency in the Environmental Review Process for the Regional Connector Transit Corridor Project, as invited to do so by your letter of March 13, 2009.

Respectfully,

Scott D. Malsin
Mayor
City of Culver City

Dear MS. D. ROYBAL SALTARELLI

This letter pertains to the Downtown Interconnector from Union Station to METRO Seventh and Figueroa. Having attended several of your meetings during the past year ~~I made~~ may add, they were very informative, indeed. — Thanks! so. My conclusion remains even more so. It must be a subway. The light rail line must go underground. It may be more expensive to build, but in the long run pay for itself, many times over.

Not only will it ellivate much of the mounting traffic in our Central City, but make it more liveable, interesting + fascinating. That is what we need.

I remember your Grandfather very well. If for any reason you need to reach me — my ~~cell~~ telephone number is 1-626-284-6958. Gracias por todos

Sincerely,
Albert Jaffori

Dear Ms. Saltarelli:

The Museum of Contemporary Art (MOCA) has been a member of the Little Tokyo community since the opening of the Temporary Contemporary (later renamed The Geffen Contemporary at MOCA) in 1983. The building, which was converted from a warehouse space to a gallery by renowned architect Frank O. Gehry, has received international acclaim and provides 45,000 square feet of gallery space for the museum. Located just inside the Little Tokyo redevelopment area in downtown Los Angeles and adjacent to the First Street Historic District in Little Tokyo, The Geffen Contemporary at MOCA has had a major influence on the community and surrounding businesses with visitors totaling, on average, 125,000 per year. The Museum is greatly concerned about the *Regional Connector Transit Corridor Final Alternatives Analysis Report* dated 2009.

While we understand the importance of an effective regional transit system we feel the alternatives indicated in the above referenced report will have a negative impact on the Little Tokyo community unless the following specific issues are studied, analyzed and resolved to the satisfaction of the area businesses and cultural institutions:

1. *Impact of Construction on the visitor experience:* With the construction scheduled to continue over a period of 4-5 years, we are concerned that the re-routed traffic will have a negative long-term impact on our visitors' ability to access both the Museum and the surface parking lots in the area. We are also concerned about the location and physical area required to stage materials and equipment related to this construction. Furthermore, we feel the noise pollution caused by continued construction in the immediate area will impact the visitor experience coming from and going to the Museum as well as during the actual Museum visit.

2. *Impact of Construction on the Museum Collection:* Vibrations caused by construction can have a negative impact on sensitive collections stored or on display at the Museum. Although precautions are always taken regarding seismic concerns, the continued vibrations caused by construction could potentially damage delicate works, resulting in expensive conservation repairs and hindering our ability to accept loaned art from donors or other institutions.

3. *Impact on Property Owners:* The potential loss or reduced property value of long-time stake holders within the Little Tokyo community must be considered and, if necessary, must be equitable.

4. *Impact on Local Businesses:* The effect of re-routed traffic, as a result of lengthy construction, will have a tremendously detrimental impact on local businesses.

Although we believe in the importance of the Connector Transit Corridor to the overall well being of the city at large, we feel these issues need to be addressed regardless of which alternative is chosen. We appreciate the efforts of the Metropolitan Transportation Authority to keep the community informed and look forward to working with you to resolve these issues prior to the commencement of any construction.

Sincerely,

Ari Wiseman
Deputy Director

McCourt

One Gateway Plaza, Los Angeles, CA 90012

RE: Regional Connector Transit Corridor Scoping Process

Dear Ms. Roybal Saltarelli:

The Los Angeles Dodgers are pleased to be given this opportunity to comment on the scope for the Regional Connector Transit Corridor DEIS/DEIR. Based on the scoping presentation, it is our understanding that the project would allow direct connections (without the current multiple transfers) for rail riders traveling between Pasadena and Long Beach and between Culver City and the Eastside. The project would result in significant travel time savings for rail riders, make regional rail travel more convenient, and increase new transit trips by 8,000-10,000 boardings per day.

The Los Angeles Dodgers welcome the possibility of a fixed-guideway transit project that is intended to improve mobility within the downtown area by connecting to the light rail service of the Metro Gold Line to Pasadena, the Metro Gold Line to East Los Angeles, the Metro Blue Line, and the Metro Expo Line. The Dodgers are extremely concerned about the effect of roadway congestion on regional mobility and accessibility and favor transit projects that address these critical issues.

Dodger Stadium is located approximately one mile north of downtown Los Angeles. Each year, the Los Angeles Dodgers play 81 regular season games at Dodger Stadium as well as exhibition and, if required, playoff games. In 2009, Dodger Stadium also played host to the World Baseball Classic Semifinal and Final. Numerous other events, such as concerts, are hosted at Dodger Stadium throughout the year. For each event, tens of thousands of individuals travel to and from Dodger Stadium. The private automobile is the primary mode of travel due to its location away off the traditional transit grid. Making public transit a viable transportation option to Dodger Stadium is a primary goal of the Dodgers. Attractive and useful public transit would make Dodger Stadium an extension of Downtown Los Angeles.

The Next 50 plan is a vision and investment for Dodger Stadium over the next half century. Under this plan, Dodger Stadium will become more accessible, attractive and inviting, not just during games, but before and after games, on non-game days and during the off-season. Public transit will need to be a primary mode of access under this vision.

McCOURT GROUP LLC • 1000 ELYSIAN PARK AVENUE • LOS ANGELES • CA • 90012
323.224.4240 (P) • 323.224.2618 (F) • HOWARD@MCCOURTGROUP.COM (E)

Upon careful consideration of the three project alternatives (in addition to a No Build Alternative), the Los Angeles Dodgers believe that the Underground Emphasis LRT Alternative would best achieve the project's stated goals and offer the best opportunity to eventually link Dodger Stadium and downtown via rail. The TSM Alternative does not satisfy the project's stated goals. The At-Grade Emphasis LRT Alternative would achieve the project's stated goals but would not offer the same level of benefit as the Underground Emphasis LRT Alternative. The at-grade portion of this alternative could result in increased traffic congestion in the downtown area, resulting in decreased mobility for motorists. The Underground Emphasis LRT Alternative would achieve the project's stated goals and would not result in secondary impacts.

We would like to encourage Metro to focus on the Underground Emphasis LRT Alternative. Under this alternative, a suitable connection from Bunker Hill to Dodger Stadium could be provided under short- and long-term scenarios, which would benefit fans and employees, and help to alleviate roadway congestion on regional mobility and accessibility. This alternative would be the best way forward in providing attractive and useful public transit to Dodger Stadium. The connection could initially consist of a shuttle bus and ultimately a fixed-guideway rail system (combination of subway & elevated). A rail connection between downtown and Dodger Stadium is a vision we hope to realize in the future.

The Los Angeles Dodgers are looking forward to working together with Metro on this important mobility project.

Sincerely,

Howard Sunkin

Ms Dolores Roybal Saltarelli
Project Manager
Los Angeles, County MTA
One Gateway Plaza
Los Angeles, CA 90012

Dear Ms Roybal Saltarelli:

As a business that will be celebrating its 100th anniversary in 2010 and a member of various organizations in Little Tokyo, I am very concerned with the proposed Regional Connector. While I feel that improved and efficient public transportation will be vital to the future of Little Tokyo and favor the Underground emphases alternative via Second Street, I have strong concerns about the negative impacts that construction will have on the residents, businesses, tenants, property owners, customers, and visitors.

1. The disruption of businesses that will be directly impacted by construction. Closure of streets, stoppage of utilities, loss of customer parking spaces, noise and air pollution. There will need to be meetings with these business owners so they can plan and know in advance what to anticipate and where to call.

2. Little Tokyo has many residents, especially near Alameda, Second Street, and Central Avenue. These people will also be affected by street closures, stoppage of utilities, noise and air pollution as well as being able to cross Alameda and First Streets. With the anticipated trains crossing Alameda and 1st Street intersections "every 2 ½ minutes both ways", there will need to be a safe, efficient pedestrian crossing for Alameda and First Street, possible a escalator overpass. This should be a priority since the Gold Line will be opening this summer.

3. Loss of On-Street and Off-Street parking during construction should be mitigated, possibly by using open spaces or areas not yet in construction. After construction parking spaces should be replaced. City of Los Angeles Community Redevelopment Agency is conducting a parking study and identifying parking areas. The METRO should use that information.

4. I would support another station on the Underground emphasis alternative at Second Street, between Los Angeles and San Pedro Streets.

三河屋

In closing, I appreciate the opportunity to comment on the Regional Connector and appreciate the METRO Regional Connector team to work with the community on a on-going basis so that we can all have a public transportation system that will benefit Little Tokyo, the City of Los Angeles and all its inhabitants.

I look forward to future meetings and a continued working relationship,

Sincerely,

Subject: Regional Connector Transit Corridor

Dear Ms. Saltarelli:

On behalf of the Little Tokyo Business Association (LTBA), we are responding to the Regional Connector Transit Corridor Environmental Impact Statement/Environmental Impact Report (EIS/EIR) public scoping process.

The Little Tokyo Business Association is in support of the construction of the "Underground Emphasis LRT Alternative, with a Station location at 2nd Street between Los Angeles and San Pedro Streets."

In light of the positive impacts this project may bring to the greater Los Angeles community, our organization is concern with negative implications and impacts to the current business owners, tenants, property owners and valued visitors and customers of the Little Tokyo community. The following is a list of our concerns, which mitigating measures needs to be implemented and documented in the EIS/EIR:

1. ***Eminent Domain:*** Business owners, tenants and property owners, whose business endeavors are taken away through eminent domain are to receive fair and just treatment. Fair and just relocation costs shall be made available to those businesses displace through eminent domain. Every effort shall be made to assist those displaced businesses and tenants who express their desires to stay in the Little Tokyo community. In addition to relocation cost, additional funding shall be made available to assist those displaced businesses with desires to stay in the Little Tokyo community.

2. ***Replacement On-Street and Off-Street Parking:*** All off-street parking spaces lost through eminent domain shall be replaced. All on-street and off-street parking spaces taken away during the course of construction shall be replaced.

3. ***Business Interruption:*** During the course of construction, every effort shall be made to minimize adverse impacts which businesses, tenants, property owners, and valued visitors/customers may encounter that prevents them from conducting reasonable business and personal activities within the Little Tokyo community. Additional funding shall be made available for those businesses, tenants or property owners whose business endeavors are adversely impacted during the course of construction. A special business interruption committee shall be established, whose membership shall include Little Tokyo businesses, tenants and property owners, along with those government agencies having jurisdiction to make policy to resolve issues arising from adverse business interruptions during the course of construction.

4. ***LRT Station:*** In the Underground Emphasis LRT Alternative there is a proposed a station location underground in an area at 2nd Street between Los Angeles and Main Streets. A commitment shall be made that a station will be constructed at 2nd Street between Los Angeles and San Pedro Streets, with pedestrian access at grade.

Respectfully yours;

Wilson Liu

Subject: Regional Connector Transit Corridor

To whom it may concern:

As I am unable to attend the numerous “public scoping” meetings to give input on the proposed Corridor, I’d like to provide my perspective.

As a businessman who frequently travels in Los Angeles County I oppose any surface transportation being added to the already congested streets.

The corridor is not only essential; it is most welcome, and long overdue!

However, let’s keep in mind that the already overstressed streets and freeways cannot support any added transportation and that includes the Connector.

The Connector must be built underground.

Let’s keep the noise, the congestion away from our already congested streets and freeways.

Thanks for your careful attention to my input.

COMMENT:

Will traffic from Temple s.b. on Alameda be restricted to R.T.O. at First St. and will this be applicable to both alternatives? What will be the anticipated level of services on the streets and the resulting circulation plan?
This alternative may not impact the core of Little Tokyo during construction and in the future as much as the underground alternative.

UNDERGROUND ALTERNATIVE
The loss of 200 parking spaces is critical to the area. There are seveeral non-profits in the area with surface parking areas adjacent to their premises. Will public funding be available to build additional parking on these sites with stipulations that would reserve a portion of the site for their use?

MS99/22/52
Los Angeles, CA 90012

Dear Ms. Roybal Saltarelli:

The Little Tokyo Community Council (LTCC) is a council of more than 100 stakeholder organizations dedicated to the future vitality of our historic and cultural neighborhood. On behalf of LTCC, I take this opportunity to express our concerns related to the proposed METRO Regional Connector. While we recognize the importance and need for efficient public transportation for the Los Angeles area, we believe that the proposed alignments can have irreparable negative impact on our community unless specific issues are responsibly addressed and analyzed.

The concerns of LTCC in respect to the proposed Regional Connector alternatives include:

- Impact of construction on local businesses
  Disruption of business due to construction, and resulting diversion of traffic for an extended period of time can have devastating effects on small businesses.

- Loss of public parking
  Loss of convenient and available parking will impact negatively on public institutions and businesses, discouraging visitors and customers.

- Impact to key Little Tokyo property owners
  Potential loss and/or construction on major properties in Little Tokyo eliminate potential for future development benefiting community. Every consideration should be given to longtime community stakeholders who face loss or devaluation of property.

- Noise Pollution
  On-going noise from construction negatively impacts, business, community programming, and daily activity.

- Transit Creating Physical Barrier through the Community
  Above grade train and/or transit hub will potentially create a physical barrier, cutting off portions of the community and inhibiting travel and access.

We also take this opportunity to convey our strong recommendation that any Connector Alignment option must incorporate a Little Tokyo Station-West in order to promote Little Tokyo as a destination, providing convenient access for our patrons and workers.

Construction of the Connector above or below grade should be an enhancement to the community, and we strongly urge that issues of urban design, creative utilization of surrounding areas, in terms of development, public art, etc are incorporated into the project.

We appreciate the efforts by METRO to keep the community informed as to the progress of this project, and look forward to a continued close working relationship.

Sincerely,

Chris Aihara

Subject: letter from a new downtown resident

Hello,

I am a new resident of the Higgins that believes in the revitalization of downtown. I think its a great idea to make public transportation a top priority and I applaud the council for looking to all avenues possible to make LA less automobile reliant...

With that said, I do believe that in it's current state, Downtown LA is difficult to navigate with all the one way streets and 2nd street is one of the few 2 way streets in the city. Creating an at-grade connector would severely disrupt traffic flow, divide a neighborhood, and cause that part of the city, with the soon to be added, little tokyo/arts district stop, congested beyond today's standards. Isn't creating public transportation supposed to decrease congestion instead of add to it?

I will be pushing for an underground station; one that would keep the confusing rails, electric lines, and street cars off the streets, and provide a needed safety to drivers, pedestrians and rail commuters. To add, this would be more aesthetically pleasing and would cut down on noise pollution. While I understand that this means would be more expensive, in the long run I believe it would be economical creating something that the city can use for 20+ years in the future... if we're going to do it, lets do it right with the quality. Let's not just create something that would ease the problem now... lets get rid of the problem and let's keep it gone for the future...

I hope someone reads this and a light switch goes off. I hope someone thinks about what downtown could be and how we have the opportunity to do something write for the future and not just for today. Please consider all the above and put yourselves in the shoes of the residents and employees of downtown that see what a great community this can be and the golden future that can take place if things are done right and not just done in haste...

Thank you for your time,

Pamelo E. Costales Jr.

A proud downtown resident

Re: Comments on the Regional Connector Scoping for EIS/EIR

Thank you for giving me the opportunity to comment on the Scoping Information related to the EIS/EIR for the Regional Connector. I made some oral comments at the public meeting held at JANM on April 1st, but I wanted to follow-up with additional comments about scoping issues on the proposed Regional Connector Alternatives that need to be addressed, as follows:

At-Grade Alternative

The Scoping meetings and the materials did not clarify how the at-grade would be designed and operate along 2nd Street, nor on Main St. and Los Angeles St. There are also several driveways along this alignment that needs to be fully analyzed for safety; these driveways include access to the new LAPD headquarter building, the new LAPD jail, Caltrans building, City Hall, City Hall East, and the Kyoto-Grand Hotel.

The capacity of the intersections along the alignment also need to be carefully analyzed. There will be a significant reduction in street width on 2nd Street, since it's currently only 36 feet to 40 feet wide. The remaining single lane available on 2nd Street may be inadequate to offer the width needed for proper circulation for the area and additional street widening may be needed, or it may also have to operate as one-way, including inside the 2nd Street Tunnel.

Although the split station is offered at the Civic Center next to City Hall, the Little Tokyo community would rather have a station in Little Tokyo, because the City Hall site is too far away. The Civic Center site would only be used during the week days, but would not be used at nights, weekends and on Holidays. Therefore, Metro should consider another station site on 2nd Street that would better serve the residents of Little Tokyo and the customers who come to the Little Tokyo businesses.

At-grade alternative for the Downtown Connector is very problematic because of potential accidents and the lack of operational reliability. Metro should also be aware that LAPD often closes Civic Center area streets due to demonstrations, and Little Tokyo community closes streets for their Annual Nisei Week Grand Parade that affect surrounding streets as well. Since the Parade Route includes Los Angeles Street, where the LRT alignment runs, the Little Tokyo community does not support the at-grade alternative.

Construction impacts are a major concern for the Little Tokyo community. The traffic impacts, and impacts to businesses during construction, noise and dust are all concerns that need to be fully disclosed, analyzed, and fully mitigated.

Subway Alternative

The Scoping meetings also did not clarify the details of the subway alternative as it relates to how it would be designed and operated at the intersection of 1st and Alameda St. It is my understanding that Alameda St. will be grade separated below 1st Street, but that the rail connections will all be at-grade. I suggest that the grade separation project be the first phase of work to minimize the overall impact. Furthermore, it was said that there will be grade separated pedestrian crossing of the tracks, as well as frontage roads along Alameda St. Traffic modeling and simulation of the traffic and trains would be necessary to convince me and the community that the intersection could operate satisfactorily, even with the grade separation. Furthermore, it would be necessary to maintain and allow street level crossings in all directions for pedestrians at the intersection.

There are concerns about the impact of the tunneling work under 2nd Street, particularly if utility relocation work impacts the intersection of 2nd and Central Avenue. The businesses as well as the community have concerns with traffic and parking impact during construction the ability to conduct their businesses.

The owner of the property where Metro intends to stage construction and where the tunnel boring machine will be set is a friend of the Little Tokyo community, so the community is concerned about how Metro will treat the owner. Would it be possible to have the owner partner with Metro for any development project at the site?

Station construction on 2nd Street is another concern to the community, since it involves a cut and cover technique. The Nisei Week Parade is held in August, and that has a Route along 2nd Street, so the community is concerned about not being able to have the Nisei Week Grand Parade, unless construction is coordinated to avoid that disruption. Furthermore, the community would like to see the subway station closer to Little Tokyo, say an entrance at Weller Court, rather than where it's currently proposed behind the Caltrans building. That's because when taking the train from East LA, the station spacing would already be more than a mile at Alameda Street. I believes that there should be two stations on 2nd Street, one closer to Little Tokyo, and second one closer to Hill Street on the east side of Bunker Hill. The community believes that it's important to have the Little Tokyo Station close to 2nd and San Pedro St. for security reasons, and in order to properly serve the residents and the business patrons at nights and weekends.

Thank you for the opportunity to comment on the Scoping for the EIS/EIR for the Regional Connector.

Sincerely Yours,

James M. Okazaki

Subject: Pasadena Scoping Comments on Metro Regional Connector

Dear Ms. Roybal-Saltarelli,

Thank you for the opportunity to provide comments related to the Notice of Preparation and public scoping for the Draft Environmental Impact Statement/Draft Environmental Impact Report (DEIS/DEIR) for the Metro Regional Connector Project. Based on our review of the scoping documents, we are requesting the following potential project impacts be considered and analyzed in the DEIS/DEIR.

1. Ridership analysis for trips from Pasadena for the alignment that provides the most direct connections to employment centers in Downtown Los Angeles, eliminating the need for Gold Line passengers to transfer to the Red Line.
2. Ridership analysis for trips from Pasadena for the alignment that provides the fastest connection through downtown to promote through trips to/from Pasadena on the Blue and Expo Lines.
3. Comprehensive traffic impact analysis for intersections surrounding the existing Gold Line at-

grade crossings in Pasadena for any project alternative that would result in trains operating in Pasadena at frequencies greater than that "cleared" in the Pasadena Blue Line EIR.

The majority of the project's potential impacts are localized to downtown Los Angeles. However, due to the scale of the project and the potential regional considerations, Pasadena requests to receive future CEQA notices for the project.

The City of Pasadena appreciates the opportunity to comment on the project. Should you have any questions regarding this letter, please do not hesitate to contact me at (626) 744-7474.

I think that the Regional Connector is very much needed in Los Angeles. Once the Gold Line Eastside extension is up and running, and the Expo line - the need for the connector will be even greater. In adddition I look forward to the additional connections with the possibled downtown stations. I believe that light rail should be used, entirely grade spearated and underground - following the Underground Emphasis LRT Alternative as presented. Double-tracking the system, if possible, in both directions would seem smart to accomidated the enormous frequency of trains through this vital connection.

I think that the regional connector is possible the most important rail project currently under study for Los Angeles.

Thank

Subject: Metro Connector Comment

It was interesting to hear the MTA presentation to the Little Tokyo Community Council on April 28, 2009.

All of the benefits mentioned for connecting the Little Tokyo Gold Line station to the 7th Street station related to MTA riders. There was no mention of how the connector would offer any benefits to Little Tokyo.

The proposed Underground Connector Alternative would have a very negative impact on Little Tokyo. APPROXIMATELY 20 PERCENT OF THE EXISTING COMMERCIAL AREA IN THE LITTLE TOKYO CRA PROJECT AREA AND OVER 200 PARKING SPACES WOULD BE LOST. During construction,1st and 2nd St will be closed for an extended

time. Many of our small businesses would not be able to survive the disruption of their activities. Moreover,once the project is completed, the constant flow of trains at grade across the intersection of 1st and Alameda will disrupt the eastern portal of Little Tokyo. To have a subway under 2nd St will not bring any more visitors or shoppers to Little Tokyo.

Over the last 25 years, the community and the Los Angeles Community Redevelopment Agency have worked very hard to make Little Tokyo the vital community that it is today. It is not fair to ask that we sacrifice all that we have achieved just to solve a lack of adequate transportation planning by MTA 20 years ago.

I urge MTA to select the No Build Alternative or the At-Grade Alternative along Temple Street.

Subject: Comments from Go For Broke National Education Center

Hello Regional Connector Team,

The Go For Broke National Education Center respectfully submits our concerns and opposition for the Upper Grand Route 1 Alternate (Temple/Alameda at-grade alternative) due to the following: The proposed route will negatively limit the vehicular ingress and egress of the proposed Go For Broke National Education Center project site as it will block the site's only street frontage on Temple Street between Alameda and Judge John Aiso Street. The limited width of Temple Street may also require the widening of the street on the side of our project site creating severe impact to the infrastructure of the building. The proposed

route will also create substantial vibration and acoustical disruptions to the operation of the exhibition facilities housed in the building.

Attached please find a copy of the Go For Broke National Education Center's site plan for your review and consideration of our concerns.

Best regards,
Diane Tanaka

Subject: Regtional connector public comments

Below is my formal public comments on the regional connector for the record.

I would like to express my strongest support of the Underground Emphasis LRT alternative. This alternative will result in the best performance of the connector among the four alternatives considered. It features the highest ridership, the shortest travel time, the lowest operating costs, and the least traffic impact. These are the most important factors in building the public transit infrastructure in dense urban areas, and all of them are optimized by the Underground Emphasis LRT alternative. While this alternative is slightly more expensive in terms of the construction costs, we are building the future of this city, and we cannot afford to build this project cheaply and badly. Thus, the underground alignment must be chosen.

Sincerely yours,

Yuri Popov, Ph.D.

Dear Metro-
As a long-time resident of downtown, I am pleased and excited about the possibility of the regional connector. However, I feel strongly in favor of the below-grade option, as I believe the at-grade option will contribute to congestion rather than relieve it, and impact area-business negatively during construction in a way that will be mitigated with the below-grade option. I am in support of public transportation, AND a pedestrian-friendly downtown…the below-grade option is far better on both counts.

Thanks for taking my comments.

Cc: June Berk ltcc
Subject: Regional connector scoping comments

From Howard Nishimura, former chairman of the Little Tokyo Community Council and Board member.

The comments that I am presenting do not represent the overall view of the board but my personal opinion only.

The Little Tokyo Community has been reduced time and time again for the expansion and growth of City and federal government buildings and to the extent that this new project will continue to make our overall size much smaller as it is presently configured I would like to have the regional connector consider the following suggestion. The traffic is horrible as it exists today and the benefit of the the regional connector as it is presently

being considered is negligible at the cost of losing another block. My observations are as follows:

1. The route of the regional connector line should be redesigned to have the rail line continue south after crossing the freeway and a portal put on the MTA or RTD site and continue underground and create a station on the Mangrove site and split the Gold line to continue to the Eastside Gold line with the connector to the Blue Line.

2. One benefit of this routing is that the split level traffic on Alameda and First Street would not be necessary. This split level concept would be a disaster without the left turn lanes at that particular intersection. The regional connector could tunnel under the First Street and Alameda Street intersection instead of the cars being subject to this problem.

3. Another benefit would be that the property bordered by 1st Street on the North, Alameda Street on the East, 2nd Street on the South and Central Avenue could hopefully be maintained with the minimum amount of disruption to the tenants who presently are operating a business on the location at the present time.

4. With Little Tokyo only having the one station the Regional connector will have very little benefit to the customers, business owners and residents of the Area. A second station if located on 2nd and Main or Los Angeles would be a greater benefit to Little Tokyo.

As this may creat a disagreement with the developers of the Mangrove Site I would propose that the Little Tokyo station if the station does not need the land of the Little Tokyo station that it be given back to the developers for addional development.

This represents my comments and I know how you will probably will not entertain such a radical idea I leave you with my best wishes on a successful project and I hope that Little Tokyo survives whatever you decide on.

Howard Nishimura

Subject: Environmental Review Process

Dear Sir and Madam,

Based on the April 13, 2009 presentation on the Westside Extension Project (WEP), CSS fully supports the MTA's efforts to increase public transportation in the County of Los Angeles. It is projected that the senior population in L.A. County will grow exponentially over the next 10 years. For this reason, we anticipate many seniors using the WEP rail service. It should be noted that senior safety should be given special consideration, especially during evening hours. In addition, we support the rail transit option that has the highest number of stops near resources and services for seniors.

Should you need additional information, please call me at (213) 738-2645.

Regards,

Minh-Ha Nguyen, Assistant Director
Aging & Adult Services Branch
Community & Senior Services
3333 Wilshire Boulevard, Suite 400

Los Angeles, CA 90010

Subject: Regional Connector - "underground" alt. concerns

To whom it may concern,

I'm writing to voice my concerns about the "underground" alternative to the Regional Connector. While I agree with the benefits of the Regional Connector and believe that it will fulfill an unmet need by connecting the blue and gold lines, my concern is with the "underground" alternative and its negative impact to the Little Tokyo community.

It is my understanding that with the "underground" alternative the properties in the square block bordered by 1st. street and 2nd street on the North and South, and Alameda and Central on the East and West will need to be purchased. I'm concerned that this can have a negative impact on the already tiny community of Little Tokyo. I am a Los Angeles native and currently live near Little Tokyo. My wife and I frequent Little Tokyo on a regular basis and I've been able to observe the dynamics of this community over the years. The square block in question currently houses 2 parking lots, approximately 9 eateries and an Office Depot. With already limited parking options, getting

rid of the 2 parking lots could possibly lead to greater congestion in the area, as well as a decline in overall foot traffic and visits to Little Tokyo due to a decrease in available parking. In addition, the 9 eateries serve as a main traffic generator to Little Tokyo. A simple observation during lunch or dinner can confirm the amount of traffic generated by the businesses and parking lots on that square block. I would argue that the square block alone brings in nearly 50% of the visitors to Little Tokyo, with its businesses and parking lots.

I urge you to strongly consider the "at-grade" alternative to the Regional Connector. I am sure there are pros and cons to both alternatives, but a major con to the "underground" alternative is its obvious negative impact to the Little Tokyo community. Thank you for spending your time reading this and I hope that my comments will be considered when choosing the appropriate scenario.

Thank you,
Bryant Ng

Subject: Regional Connector CEQA Scoping comments

Metro,

My name is Gunnar Hand, AICP and I am a member of the Downtown Los Angeles Neighborhood Council (DLANC). While my association with DLANC lends some weight to my comments, I want to be clear that this email does not represent the views of DLANC. I am, unfortunately, a lone dissenting voice for this project on my Board. I would like to focus my comments for the Draft Environmental Impact Report on the alignment and station locations for this project proposal. Primarily, this new transit line should connect directly to Union Station. Instead of creating a separate train that would require a transfer at the 7th and Metro Station, the Regional Connector should extend the Blue Line and the Expo Line into Union Station. It has always been the intent of Metro to make Union Station the primary hub for mass transit in the region, and this would help solidly this position. Additionally, if the original intent of the Regional Connector was to provide a link from the 7th and Metro Station to Union Station, I would respond by saying that this connection already exists (the Red/Purple Line), and the entire project is an unnecessary waste of taxpayer money. While your projected ridership numbers are astounding for this Regional Connector, how much of that traffic is new trips as opposed to shifting trips away from the Red and Purple Lines? In regards

to the alignment, this Regional Connector, or extension of the Blue and Expo Line should remain under ground at 7th and Metro and proceed to a new subterranean platform in Union Station. This could create an additional opportunity to create linkages and transfers between the Gold, Red, Purple, Blue, and Expo lines, as well as Metrolink and Amtrak. As the project seems to be heading towards an above ground alignment and a terminus at the Gold Line East extension station at Alameda and 1st Streets, my primary concern here is the required turn around and end of track infrastructure required at this already congested intersection. With proposed development to occur all around this station, where will this infrastructure go? I fear that through this approach of connecting transit lines, we may create a disconnect in the community and an impermeable barrier between Little Tokyo and the Arts District. While most of my comments are directed at the project itself, hopefully this will help guide the EIR in developing project alternatives that not only have less impact, but many more benefits. Thank you for your time,

GUNNAR HAND, AICP

Subject: Regional Connector Comment

Hello, thank you for this opportunity to comment on this transit project. This is, apart from the "Subway to the Sea" Purple line extension, the most important rail project right now. I am for all rail projects that have been proposed under Measure R, and even more than that. Further, any other projects that Metro is undertaking that involves a decision between Rail or “Dedicated Bus lanes”, please think to the future, and realize that trains must connect to trains to create not only an organized looking system, but for efficiency’s sake. To stick to the point of the Regional Connector and the decision between At-grade or Below-grade, the issue is quite easy. It must be Below-grade. There are many reasons why. First, The Blue Line (and future Expo Line) already terminates at 7th.st./Metro Center which is underground, so it would therefore seem odd for it to emerge from under the ground after that point. Second, I implore you to think of the traffic mess it could create if it were made at street level. The already crowded streets of both cars and (more importantly) pedestrians will make the train run slower, cause traffic instead of solve it, and more dangerous. Third, from a purely cosmetic point of view, it would look completely out of place with wires, rails, crossing signals, and the train its self with its horn. A downtown area, one that is and will continue to grow, is no place for an At-grade train. I also have heard that the price difference between the two choices is within 20% of each other. Given the fact that we now have Measure R, and more importantly the Federal Stimulus Package delivering several hundred million dollars to Metro, the cost difference is negligible. My final point is this; look to the future, does an At-grade rail system make sense? If your goal is to reduce traffic, and increase the speed at which people

commute by rail, then the train must be underground to connect to our already underground stations.

Thank you for your time,
Matthew Gunter

Subject: Regional Connector Transit Corridor

April 28, 2009

Ms. Dolores Roybal Saltarelli
LA County MTA
One Gateway Plaza
Los Angeles, CA 90012

Dear Ms. Roybal Saltarelli:

I heard a presentation by MTA staff at the Little Tokyo Community Council Meeting today. Although I applaud the County's work to improve mass transit, I am very concerned about the impact that the project will have on the Little Tokyo community. Given the present economy, I am afraid that the impact will have a severe, and possible permanent negative impact on the already fragile business and cultural community here. I own a retail business that has been in the same location on First Street for over 60 years. I have witnessed a dramatic reduction of family-owned businesses in Little Tokyo, and I feel very protective of this area. I am concerned over the following issues:

1. In the underground scenario, it was not fully clear during the presentation whether or not there would be traffic lanes taken away on 2nd Street. 2nd Street is already slow and congested at any time of day, and any fewer lanes would make its level of service unacceptable, unless it is made a one-way eastbound street.

2. I regret the impact the project will have on business on the block east of Central between First and Second. Perhaps the loss cannot be helped. However, there MUST BE NO REDUCTION in the number of public parking spaces. Parking is the single most critical problem this community has. If parking is lost on that block, they should be mitigated at a location within Little Tokyo.

3. I fear the worst regarding the impact on businesses 2nd Street during construction after the experience of the Hollywood line. Would you consider undergrounding at Temple or 3rd Street?

4. I understand there will be 25 trains an hour. How will traffic flow on First Street during rush hour traffic?

Thank you for addressing these issues that are very important to us.

Sincerely,

Irene Tsukada Germain

Subject: Little Tokyo Connector

Dolores Roybal Saltarelli,

Regarding the Metro Connector proposed to connect via through or near to the Little Tokyo community, I am not in favor of the below grade alternative. I believe that there are several factors that may/will have an adverse affect on the Little Tokyo community including but not limited to:

1. Potential negative effect on both JANM and MOCA museums, in terms of available parking for their visitors. The 1st and Alameda/Central parking lot is one of the primary parking areas for these museums.

2. Potential serious negative effect on all Little Tokyo businesses. I believe that not only the obvious businesses would be affected (1st and Central and Office Depot complex), but also adjacent businesses. A long period of construction was stated at the recent Q & A meeting @ the LTCC meeting on 4/28/09. I believe that the reality and the perception of the public could be that of a "hassle" to enter, shop, visit, eat, meet, etc.. in Little Tokyo. That kind of perception can kill businesses in the immediate area and have a negative effect on all businesses--as a customer may never make it to the center or the west side of Little Tokyo.
3. I do not agree with the concept that more visitors will result from the below grade. Actually I think it will be the opposite versus an at grade solution (i.e. Temple Street)
4. General traffic impact due to the probable train frequency and the negative impact that will have on one of the entrances into Little Tokyo.
5. Loss of significant number of surface parking spaces (approximately 200) for general public parking for the area, both on the 1st and Central site as well as the Office Depot site.

As an objective business person, I believe that it takes a long time to cultivate a business/following and a great community. With a severe disruption, failed businesses are probable and it will very likely take a long time to rebuild. To me the question, "is that risk necessary?" needs to be asked. My opinion is that it is not.

I urge the MTA to make a selection of the No Build or Temple Street At-Grade alternative. I believe that the Temple alternative may be able to achieve the best results for all parties--
a.) Providing the desired connector
b.) Doing so in a way that would not require significant sacrifices of the Little Tokyo community and its businesses.
c.) Actually increasing visitors to our community (or adjacent neighborhoods) via riders actually seeing some of the area and perhaps coming back into the Little Tokyo community at a later time.

Sincerely,

Subject: comment: stations need many portals

I'm glad to hear that Metro is moving forward with the Regional Connector project.

I don't know where the stations will be built, but wherever they are built, I hope that they are underground, and I hope that there will be plenty of portals.

The current Red Line stations don't have very many entrances and exits. The big portals are great, but they shouldn't be the only exits.

Other cities with subway systems have stations with lots of portals, entrances, exits and pedestrian tunnels that lead to the stations. This makes it much easier for people to find the stations and get inside.
For the downtown area, it would not be enough to have only one or two entrances.

For example, if there is a station near the Bonaventure Hotel, there ought to be a station entrance that leads directly into the Bonaventure Hotel. There ought to be station entrances that lead directly into downtown office towers. This sort of thing happens all the time in downtown Tokyo.

If it is too hard to have a station entrance lead directly to a building, then the stations ought to have multiple exits.

Thanks,

- James Fujita

Subject: Regional Connector - scoping comments

Hello Ms. Saltarelli,

With this email I'm submitting the following comments on the scope of the EIS/EIR to be prepared for the Regional Connector Transit Corridor project.

Regarding the underground alternative:

1. The MTA should consider locating an underground station as close as possible to Little Tokyo, preferably at 2nd and Los Angeles streets. Given the demolition of the "Office Depot block" and 2nd Street underground construction, Little Tokyo could suffer the largest negative impact during construction. In return, Little Tokyo should have a station that serves the community; otherwise neither the at-grade nor underground alternatives would serve Little Tokyo at all.

2. The MTA should consider providing direct assistance to businesses in LIttle Tokyo that will be negatively impacted by underground construction and its staging. This includes businesses on 2nd Street and those across from the "Office Depot block" on Central, 1st and Alameda streets.

3. The MTA needs to closely study the impact that trains will have on

vehicular and pedestrian traffic at the intersection of 1st and Alameda streets where the trains will cross at grade. 1st Street is heavily used by commuters during rush hour, and we are concerned that frequent delays at this intersection will drive neighborhood users away from the area as well as degrade air quality.

4. Little Tokyo will lose significant amounts of public parking if the "Office Depot block" is demolished and used for staging during the entire construction period of the Regional Connector. This is a significant negative impact on Little Tokyo. The MTA should consider providing replacement public parking nearby during the entire period that the agency occupies the block and to provide replacement public parking on-site after construction is finished.

Regarding both alternatives:

1. The MTA should consider topping or placing a cap on the Alameda underpass as it travels through Little Tokyo. This will provide new open space opportunities and help ease pedestrian access across Alameda to and from the new Gold Line station.

Thank you for your consideration. Please feel free to contact me if you have any questions about these comments.

To Whom It May Concern:

I strongly urge you to adopt the underground LRT alignment. Traffic mitigation, pedestrian safety, and system efficiency make this a superior option. I spend considerable time in the downtown area and ride the metro rail system rather frequently and would appreciate the improvements that would be provided by the underground LRT alignment for the regional connector.

Thank you,
Jeff

Hello,

I am writing to note my support for the underground, fully grade-separated, alternative for the Regional Connector project currently under construction. This alternative has higher ridership projections, faster commute times, and results in less additional congestion in the Downtown environment.

I also urge the project to strongly consider building this underground project with THREE sets of tracks. Once completed, this will be a difficult project to retrofit -- an extra set of tracks will allow for additional capacity, speed, and redundancy as our Light Rail network continues to expand.

Hello,

I am glad I got this on time. Since the Blue Line is one of your most successful lines, you may not want to take anything away from the Blue Line as far as frequency.

Here is what I propose.

Consider a line that goes from Union Station to Glendale. The stations can match the Metrolink stops along the way. The line will then head West to connect with the Glendale airport. That line will probably be no longer than five miles.

Blue Line – Glendale Airport to Long Beach
Gold Line – Pasadena (Montclair) to Long Beach
Purple Line – Whittier (East L.A.) to Santa Monica (Exposition)
